**Government's Exhibit 1.**

In the District Court of the United States of America for the Eastern District of Oklahoma. United States of America, plaintiff, v. Gulf Refining Company, defendant. No. 3716.

**STIPULATION.**

The United States of America, plaintiff, and the Gulf Refining Company, defendant, for the purpose of the trial upon indictment in the above entitled cause, stipulate and agree

that the following matters and things will be admitted as if fully proven at trial:

1. Throughout the period from December 1, 1916, to May 31, 1919, and prior and subsequent thereto, St. Louis-San Francisco Railway Company was a corporation organized and existing under the laws of the State of Missouri; The Kansas City Southern Railway Company was a corporation organized and existing under the laws of the State of Missouri; Texarkana & Forth Smith Railway Company was a corporation organized and existing under the laws of the State of Texas; Midland Valley Railroad Company was a corporation organized and existing under the laws of the State of Arkansas; The Atchison, Topeka & Santa Fe Railway Company was a corporation organized and existing under the laws of the State of Kansas; Gulf, Colorado & Santa Fe Railway Company was a corporation organized and existing under the laws of the State of Texas; that each of the said railroads were common carriers doing an interstate business prior to noon December 28, 1917.

2. Throughout the aforesaid period, and prior thereto the Gulf Oil Corporation was a corporation organized and existing under the laws of the State of New Jersey; that the Gypsy Oil Company was a corporation under the laws of the State of Oklahoma; that the Gulf Refining Company was a corporation organized and existing under the laws of the State of Texas; that the Gulf Pipe Line Company was a corporation organized and existing under the laws of the State of Texas; and during said period all of the capital stock of the Gypsy Oil Company, Gulf Refining Company and the Gulf Pipe Line Company was owned and controlled by the Gulf Oil Corporation, except that the directors of each of the three last mentioned companies held shares in each of said company sufficient to qualify them as directors.

All admissions subject to relevancy, materiality and competency.

(Signed) E. E. GANN

(Signed) T. G. CHAMBERS

(Signed) J. STANLEY PAYNE

*For the United States of America.*

Inflammable Placard Applied and Dome Cover Caution Card.

# CONDITIONS.

Sec. 1. The carrier or party in possession of any of the property herein described shall be liable for any loss thereof or damage thereto, except as hereinafter provided.

No carrier or party in possession of any of the property herein described shall be liable for any loss thereof or damage thereto or delay caused by the act of God, the public enemy, quarantine, the authority of law, or the act or default of the shipper or owner, or for differences in the weights of grain, seed, or other commodities caused by natural shrinkage or discrepancies in elevator weights. For loss, damage, or delay caused by fire occurring after forty-eight hours (exclusive of legal holidays) after notice of the arrival of the property at destination or at port of export (if intended for export) has been duly sent or given, the carrier's liability shall be that of warehouseman only. Except in case of negligence of the carrier or party in possession (and the burden to prove freedom from such negligence shall be on the carrier or party in possession), the carrier or party in possession shall not be liable

of loss, damage, or delay occurring while the property is stopped and held in transit upon request of the shipper, owner or party entitled to make such request; or resulting from a defect or vice in the property or from riots or strikes. When in accordance with general custom, on account of the nature of the property, or when at the request of the shipper the property is transported in open cars, the carrier or party in possession (except in case of loss or damage by fire, in which case the liability shall be the same as though the property had been carried in closed cars) shall be liable only for negligence, and the burden to prove freedom from such negligence shall be on the carrier or party in possession.

Sec. 2. In issuing this bill of lading this company agrees to transport only over its own line, and except as otherwise provided by law acts only as agent with respect to the portion of the route beyond its own line.

No carrier shall be liable for loss, damage, or injury not occurring on its own road or its portion of the through route, nor after said property has been delivered to the next carrier, except as such liability is or may be imposed by law, but nothing contained in this bill of lading shall be deemed to exempt the initial carrier from any such liability so imposed.

Sec. 3. No carrier is bound to transport said property by any particular train or vessel, or in time for any particular market, or otherwise than with reasonable dispatch, unless by specific agreement indorsed hereon. Every carrier shall have the right in case of physical necessity to forward said property by any railroad or route between the point of shipment and the point of destination; but if such diversion shall be from a rail to a water route the liability of the carrier shall be the same as though the entire carriage were by rail.

The amount of any loss or damage for which any carrier is liable shall be computed on the basis of the value of the property at the place and time of shipment under this bill of lading, including the freight charges, if paid.

Except where the loss, damage, or injury complained of is due to delay or damage while being loaded or unloaded, or damaged in transit by carelessness or negligence, as conditions precedent to recovery, claims must be made in writing to the originating or delivering carrier within six months after delivery of the property (or, in case of export traffic, within nine months after delivery at port of export), or, in case of failure to make delivery, then within six months (or nine months in case of export traffic) after a reasonable time for delivery has elapsed; and suits for loss, damage, or delay shall be instituted only within two years and one day after delivery of the prop-

erty, or, in case of failure to make delivery, then within two years and one day after a reasonable time for delivery has elapsed.

Any carrier or party liable on account of loss of or damage to any of said property shall have the full benefit of any insurance that may have been effected upon or on account of said property, so far as this shall not avoid the policies or contracts of insurance.

Sec. 4. All property shall be subject to necessary coo-  
perage and baling at owner's cost. Each carrier over whose route cotton is to be transported hereunder shall have the privilege, at its own cost and risk, of compressing the same for greater convenience in handling or forwarding, and shall not be held responsible for deviation or unavoidable delays in procuring such compression. Grain in bulk consigned to a point where there is a railroad, public or licensed elevator, may, (unless otherwise expressly noted herein, and then if it is not promptly unloaded) be there delivered and placed with other grain of the same kind and grade without respect to ownership, and if so delivered shall be subject to a lien for elevator charges in addition to all other charges hereunder.

Sec. 5. Property not removed by the party entitled to receive it within forty eight hours (exclusive of legal holidays) after notice of its arrival has been duly sent or given may be kept in car, depot, or place of delivery of the carrier, or warehouse, subject to a reasonable charge for storage and to carrier's responsibility as warehouseman only, or may be, at the option of the carrier, removed to and stored in a public or licensed warehouse at the cost of the owner and there held at the owner's risk and without liability on the part of the carrier, and subject to a lien for all freight and other lawful charges, including a reasonable charge for storage.

The carrier may make a reasonable charge for the detention of any vessel or car, or for the use of tracks after the car has been held forty-eight hours (exclusive of legal holidays), for loading or unloading, and may add such charge to all other charges hereunder and hold such property subject to a lien therefor. Nothing in this section shall be construed as lessening the time allowed by law or as setting aside any local rule affecting car service or storage.

Property destined to or taken from a station, wharf, or landing at which there is no regularly appointed agent shall be entirely at risk of owner after unloaded from cars or vessels or until loaded into cars or vessels, and when received from or delivered on private or other sidings, wharves, or

landings, shall be at owner's risk until the cars are attached to and after they are detached from trains.

Sec. 6. No carrier will carry or be liable in any way for any documents, specie, or for any articles of extraordinary value not specifically rated in the published classification or tariffs, unless a special agreement to do so and a stipulated value of the articles are endorsed hereon.

Sec. 7. Every party, whether principal or agent, shipping explosive or dangerous goods, without previous full written disclosure to the carrier of their nature, shall be liable for all loss or damage caused thereby, and such goods may be warehoused at owner's risk and expense or destroyed without compensation.

Sec. 8. The owner or consignee shall pay the freight and all other lawful charges accruing on said property, and, if required, shall pay the same before delivery. If upon inspection it is ascertained that the articles shipped are not those described in this bill of lading, the freight charges must be paid upon the articles actually shipped.

Sec. 9. Except in case of diversion from rail to water route, which is provided for in section 3 hereof, if all or any part of said property is carried by water over any part of said route, such water carriage shall be performed subject to the liabilities, limitations, and exemptions provided by statute and to the conditions contained in this bill of lading not inconsistent with such statutes or this section, and subject also to the condition that no carrier or party in possession shall be liable for any loss or damage resulting from the perils of the lakes, sea, or other waters; or from explosion, bursting of boilers, breakage of shafts, or any latent defect in hull, machinery, or appurtenance; or from collision, stranding, or other accidents of navigation, or from prolongation of the voyage. And any vessel carrying any or all of the property herein described shall have the liberty to call at intermediate ports, to tow and be towed, and assist vessels in distress, and to deviate for the purpose of saving life or property.

The term "water carriage" in this section shall not be construed as including lighterage across rivers or in lake or other harbors, and the liability for such lighterage shall be governed by the other sections of this instrument.

Sec. 10. Any alteration, addition or erasure in this bill of lading which shall be made without an indorsement thereof hereon, signed by the agent of the carrier issuing this bill of

lading, shall be without effect, and this bill of lading shall be enforceable according to its original tenor.

(It is stipulated by the parties that Exhibit No. 2 consists of 36 shipping orders, of which the foregoing is typical, and the others need not be printed.)

### **Government's Exhibit 36.**

I. C. C. No. 1048—Cancels I. C. C. No. 999. Only three supplements to this Tariff will be in effect at any time.

### **SOUTHWESTERN LINES' TARIFF NO. 26-T**

Cancels Southwestern Lines' Tariff No. 26-S

For Individual Lines' Tariff Numbers, Current and Cancelled, see page 3.

Local, joint and proportional tariff applying on classes and commodities between points in Oklahoma named on pages 76 to 82, inclusive, and points in Texas, also Texarkana, Tex.-Ark., named on pages 43 to 62, inclusive.

Governed, except as otherwise provided herein, by Western Classification No. 52 (R. C. Fyfe's I. C. C. No. 10, or reissues thereof; and Southwestern Lines' Classification exceptions and Rules-Circular No. 1-F (F. A. Leland's I. C. C. No. 1026), or reissues thereof.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates throughout this Tariff that

are made subject to Items Nos. 48, 54, 60 and 66, or reissues thereof, are not made applicable from and to all intermediate points. Upon reasonable request therefor rates which will not exceed those published in such items from or to (as the case may be) the next more distant station will (under authority granted by the Interstate Commerce Commission) be established in the manner therein indicated by the carriers parties to this Tariff, upon one day's notice to the Commission and the public.

Special Notice—The rates named in this Tariff are subject to the conditions of the Carriers' Bill of Lading, and apply from all points specified to all points specified via all lines parties, unless specifically provided to the contrary in Items 78 to 1380, inclusive, or reissues, or in other individual items.

This Tariff contains rates that are higher for shorter distances than for longer distances over the same route, such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Order (or Orders), as indicated in individual items herein.

Issued June 10th, 1914. *Effective July 24th, 1914*; except as noted on page 170 where reference is made to Note G; on page 58 where reference is made to (20); on pages 53 and 69 where reference is made to (18); on pages 5, 80, 134, 136, 141, 142, 150, 152, 165, 169, 175, 176, 178 and in item 1572 where reference is made to (21); in items 1422, 1428, 1638, 1680, 1698 and 1710 where reference is made to (8); in item 1764 where reference is made to (9); in item 1614 where reference is made to (10); in item 1536 where reference is made to Note C; in item 2358 where reference is made to Note A; in item 2546 where reference is made to Note A; in item 3024 where reference is made to Note A; in item 2606; and in items 1542, 1548, 3036, 3042, 3048, and 3054 where reference is made to (22).

	NOTE A.—Reissue; effective July 24, 1914, in Supplement No. 2.			

*Supplement No. 9 to I. C. C. No. 1048.* Cancels Supplements Nos. 7 and 8. Supplement No. 9 contains all changes from the original tariff that are effective on the date hereof.

**SOUTHWESTERN LINES' TARIFF NO. 26-T**

For individual lines' Tariff numbers, see page 2.

*Supplement No. 9.*

Cancels Supplements Nos. 7 and 8.

Supplement No. 9 contains all changes from the original tariff that are effective on the date hereof.

Local, joint and proportional tariff, applying on classes and commodities between points in Oklahoma, named on pages 76 to 82, inclusive, of tariff, pages 12 and 13 herein, and points in Texas, also Texarkana, Tex.-Ark., named on pages 43 to 62, inclusive, of tariff, pages 7 to 9 inclusive, herein.

Governed, except as otherwise provided herein, by Western Classification No. 52 (R. C. Fyfe's I. C. C. No. 10, or reissues thereof; and Southwestern Lines' Classification exceptions and Rules-Circular No. 1-F' (F. A. Leland's I. C. C. No. 1026), or reissues thereof.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates throughout this Tariff that are made subject to Items Nos. 48, 54, 60 and 66, or reissues thereof, are not made applicable from and to all intermediate points. Upon reasonable request therefor rates which will not exceed those published in such items from or to (as the case may be) the next more distant station will (under authority granted by the Interstate Commerce Commission) be established in the manner therein indicated by the carriers parties to this Tariff, upon one day's notice to the Commission and the public.

Special Notice—The rates named in this Tariff are subject to the conditions of the Carriers' Bill of Lading, and apply from all points specified to all points specified via all lines parties, unless specifically provided to the contrary in Items 78 to 1380, inclusive, or reissues, or in other individual items.

This Tariff contains rates that are higher for shorter distances than for longer distances over the same route, such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Order (or Orders), as indicated in individual items herein.

Issued November 17th, 1914. *Effective December 24th, 1914*; except as noted on page 27 where reference is made to

note B; page 40 where reference is made to note L; pages 34 to 37, inclusive; pages 41 to 43, inclusive; and in items 2622a, 2628a, 2634a, 2637a; and in other individual items.

Issued by F. A. Leland, Agent, St. Louis, Mo.

Authority No. 22145.

(Stamped:) Public File. Received; Interstate Commerce Commission; 76815; Nov 18 1914; Division of Tariffs.

See page 3 of Supplement No. 21 for corrections affecting Supplements Nos. 9 and 10.

#### SOUTHWESTERN LINES' TARIFF NO. 26-T

For individual lines' Tariff numbers, see page 2.

##### *Supplement No. 24.*

Local, joint and proportional tariff, applying on classes and commodities between points in Oklahoma, named on pages 76 to 82, inclusive, of tariff, page 8 of Supplement No. 19 and pages 14 and 15 herein, and points in Texas, also Texarkana, Tex.-Ark., named on pages 43 to 62, inclusive, of tariff, page 7 of Supplement No. 19 and pages 9 to 11 herein.

Governed, except as otherwise provided herein, by Western Classification No. 53 (R. C. Fyfe's I. C. C. No. 11, or reissues thereof; and Southwestern Lines' Classification exceptions and Rules-Circular No. 1-F (F. A. Leland's I. C. C. No. 1026), or reissues thereof.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates throughout this Tariff that are made subject to Items Nos. 48, 54, 60 and 66, or reissues thereof, are not made applicable from and to all intermediate

points. Upon reasonable request therefor rates which will not exceed those published in such items from or to (as the case may be) the next more distant station will (under authority granted by the Interstate Commerce Commission) be established in the manner therein indicated by the carriers parties to this Tariff, upon one day's notice to the Commission and the public.

**Special Notice**—The rates named in this Tariff are subject to the conditions of the Carriers' Bill of Lading, and apply from all points specified to all points specified via all lines parties, unless specifically provided to the contrary in Items 78 to 1380, inclusive, or reissues, or in other individual items.

This Tariff contains rates that are higher for shorter distances than for longer distances over the same route, such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Order (or Orders), as indicated in individual items herein.

Issued May 18, 1915. *Effective June 24, 1915*; except as noted in items 1992b; in item 2010b; on page 14 where reference is made to (48); and in other individual items.

Issued by F. A. Leland, Agent, St. Louis, Mo.

Authority No. 22813.

(Stamped:) Received; Interstate Commerce Commission; 42683; May 22 1915; Division of Tariffs.

*Supplement No. 53 to I. C. C. No. 1048.* Supplements Nos. 40, 52 and 53 contain all changes from the original tariff that are effective on the date hereof. Supplement No. 51 suspends portions of Supplement No. 50.

SOUTHWESTERN LINES' TARIFF NO. 26-T

For individual lines' Tariff numbers, see page 2.

*Supplement No. 53.*

Supplements Nos. 40, 52 and 53 contain all changes from the original tariff that are effective on the date hereof. Supplement No. 51 suspends portions of Supplement No. 50.

Local, joint and proportional tariff, applying on classes

and commodities between points in Oklahoma, named on pages 76 to 82, inclusive, of tariff, page 26 of Supplement No. 40, page 16 of Supplement No. 52 and page 5 herein, and points in Texas, also Texarkana, Tex.-Ark., named on pages 43 to 62, inclusive, of tariff, pages 19 to 21 of Supplement No. 40, pages 13 and 14 of Supplement No. 52 and page 4 herein.

Governed, except as otherwise provided herein, by Western Classification No. 54 (R. C. Fyfe's I. C. C. No. 12, or reissues thereof; and Southwestern Lines' Classification exceptions and Rules-Circular No. 1-G (F. A. Leland's I. C. C. No. 1137), or reissues thereof.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates throughout this Tariff that are made subject to Items Nos. 48, 54, 60 and 66, or reissues thereof, are not made applicable from and to all intermediate points. Upon reasonable request therefor rates which will not exceed those published in such items from or to (as the case may be) the next more distant station will (under authority granted by the Interstate Commerce Commission) be established in the manner therein indicated by the carriers parties to this Tariff, upon one day's notice to the Commission and the public.

Special Notice—The rates named in this Tariff are subject to the conditions of the Carriers' Bill of Lading, and apply from all points specified to all points specified via all lines parties, unless specifically provided to the contrary in Items 78 to 1380, inclusive, or reissues, or in other individual items.

This Tariff contains rates that are higher for shorter distances than for longer distances over the same route, such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Order (or Orders), as indicated in individual items herein.

Issued October 20, 1916. *Effective December 2, 1916*; except as noted on page 2 where reference is made to (124); on pages 6 and 7; in items 1488; 1536m, 2486a, 2496k, 3019f and 3022½d; and in other individual items.

Issued by F. A. Leland, Agent, St. Louis, Mo.

Authority No. 24574.

(Stamped:) Received; Interstate Commerce Commission; 59859; Oct 21 1916; Division of Tariffs.

*Supplement No. 60 to I. C. C. No. 1048.* Cancels Supplements Nos. 52 and 59. Supplements Nos. 54 and 60 contain all changes from the original tariff that are effective on the date hereof. Supplement No. 58 suspends portions of Supplement No. 50.

## SOUTHWESTERN LINES' TARIFF NO. 26-T

For individual lines' Tariff numbers, see page 2.

*Supplement No. 60.*

Cancels Supplements Nos. 52 and 59. Supplements Nos. 54 and 60 contain all changes from the original tariff that are effective on the date hereof. Supplement No. 58 suspends portions of Supplement No. 50.

Local, joint and proportional tariff, applying on classes and commodities between points in Oklahoma, named on pages 76 to 82, inclusive, of tariff, page 24 of Supplement No. 54, and page 17 herein, and points in Texas, also Texarkana, Tex.-Ark., named on pages 43 to 62, inclusive, of tariff, pages 17 and 20 of Supplement No. 54 and pages 14 and 15 herein.

Governed, except as otherwise provided herein, by Western Classification No. 54 (R. C. Fyfe's I. C. C. No. 12, or reissues thereof; and Southwestern Lines' Classification exceptions and Rules-Circular No. 1-G (F. A. Leland's I. C. C. No. 1137), or reissues thereof.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates throughout this Tariff that are made subject to Items Nos. 48, 54, 60 and 66, or reissues thereof, are not made applicable from and to all intermediate points. Upon reasonable request therefor rates which will not exceed those published in such items from or to (as the case may be) the next more distant station will (under authority granted by the Interstate Commerce Commission) be established in the manner therein indicated by the carriers parties to this Tariff, upon one day's notice to the Commission and the public.

Special Notice—The rates named in this Tariff are subject to the conditions of the Carriers' Bill of Lading, and apply from all points specified to all points specified via all lines parties, unless specifically provided to the contrary in Items 78 to 1380, inclusive, or reissues, or in other individual items.

This Tariff contains rates that are higher for shorter distances than for longer distances over the same route, such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Order (or Orders), as indicated in individual items herein.

Issued January 20, 1917. *Effective March 3, 1917*; except as noted on page 17 where reference is made to note A; on page 54 where reference is made to note A; on page 56; on page 63 where reference is made to note A; on page 64 where reference is made to note L; on page 64 where reference is made to note 3; on page 65 where reference is made to note C; on page 65 where reference is made to note S; in item 71; in item 1536q where reference is made to note J; in item 1844a where reference is made to note A; in item 2496o where reference is made to note F; in item 2508h where reference is made to note 2; in item 30221½g where reference is made to note F; in item 3023f where reference is made to note C; in item 30231½c where reference is made to note A; in item 3024h where reference is made to note C; in item 3026f where reference is made to note A; and in other individual items.

### RULES AND CONDITIONS OF THE WESTERN CLASSIFICATION.

•   •   •   •   •   •   •   •

#### RULE 32.

•

SECTION 4. When shipments of inflammable liquids subject to Section 1825, Rule 44, are loaded in tank cars, the domes of which are not of sufficient capacity to cover the two (2) per cent outage as required, an allowance will be made from the shell capacity of tank to cover the difference between the dome capacity and the two (2) per cent outage.

Shippers must show on bills of lading or shipping receipt both the shell and dome capacity of car.

•   •   •   •   •   •   •   •

## RULE 44.

*Interstate Commerce Commission*

## REGULATIONS

for the

*Transportation of Dangerous Articles Other Than  
Explosives by Freight.*

Prescribed under the act of March 4, 1909, and section 15 of the act to regulate commerce, as amended June 18, 1910. Revision formulated and published July 2, 1914, effective October 1, 1914, and superseding regulations published January 1, 1912.

## GENERAL NOTICE.

1701. Special precautions are necessary in preparing for shipment packages of dangerous articles other than explosives, and in handling these packages during transit. Any failure of a shipper, or of a carrier, to perform the duties imposed upon him in this respect may be the actual or a contributory cause not only of destructive fires but of disastrous explosions, since large quantities of explosives are transported frequently through thickly populated districts and in trains containing cars loaded with other dangerous articles.

1702. Sections 235 and 236 of the act of March 4, 1909, require the shipper of dangerous articles to describe and mark his packages properly and to inform the agent of the carrier of the true character of their contents. Heavy penalties are provided for the shipper who, knowingly, solicits the transportation of dangerous articles without complying with these requirements, as well as for the carrier that knowingly transports them.

1703. To promote the uniform enforcement of law and to minimize the dangers to life and property incident to the transportation by land in interstate commerce of dangerous articles other than explosives, the following regulations are prescribed to define these articles for freight transportation purposes, to state the precautions that must be observed by the shipper in preparing them for shipment, and by the carrier in handling them while in transit. It is the duty of each such carrier and shipper to make the prescribed regulations effective and to thoroughly instruct their employees in relation thereto.

1704. These regulations apply to all shipments of dangerous articles other than explosives, including carriers' material and supplies.

1705. Specifications as to containers, methods of packing for shipment, etc., will be considered and prescribed from time to time. Orders prescribing such specifications will be given effective dates as conditions and investigations may appear to warrant.

1706. The Bureau for the Safe Transportation of Explosives and other Dangerous Articles, hereinafter called Bureau of Explosives, organized by the railways under the auspices of the American Railway Association, is an efficient bureau in charge of an expert chief inspector. This bureau will make inspections and conduct investigations and will confer with manufacturers and shippers with a view to determining what specifications and regulations will within reasonable limits afford the highest degree of safety in packing and preparing these dangerous articles for shipment and in transporting the same. The Commission will seek to avail itself of the expert knowledge thus developed and, in formulating amendments to these regulations or specifications supplemental thereto, while not bound thereby, will give due weight to such expert opinions.

#### GENERAL RULES.

1711. Carriers that are subject to the act to regulate commerce must not receive shipments of articles defined as dangerous by these regulations when the shipments are not packed, marked, labeled, described, and certified as prescribed herein. The method of manufacture and packing of articles defined as dangerous by these regulations, so far as it affects safe transportation, must be open to inspection by a duly authorized representative of the initial carrier or of the Bureau of Explosives.

1712. All shipments of articles subject to these regulations offered for transportation in interstate commerce must be properly described by the shipper in his shipping order and bill of lading under the specific or general name provided for the description of such freight by the carrier's classification and tariff governing.

The same description of contents must be marked plainly on the outside of each package.

In less-than-carload shipments each package must be marked also to show plainly the name and address of the consignee. This address, the name of contents, and the required label or "no label required" marking, should be as near together as practicable.

1713. All shipments of articles defined as dangerous by these regulations, and for which detailed instructions for pack-

ing are not given herein, must be securely packed in containers strong enough to stand without rupture or leakage of contents all ordinary shocks incident to reasonably careful handling during transit. It is the duty of shippers, where leakage from their shipping containers is known to be a probable source of fire or material damage to other freight, to exercise special care in constructing shipping containers for such articles, even though their names do not appear in the list of dangerous articles, paragraph 1807.

1714. Carriers must forward shipments of dangerous articles other than explosives promptly and within 48 hours after acceptance at originating point or receipt at transfer station or at interchange point, and consignees must remove such shipments from the carriers' property within 48 hours after notice of arrival at destination, Sundays and holidays not included.

1715. (a) *Serious violations of these regulations*, such as the discovery of leaking or broken packages of dangerous articles, and *accidents or fires* in connection with the transportation or storage on carrier's property of dangerous articles, must be reported by the carrier to the chief inspector of the Bureau of Explosives, 30 Vessey Street, New York City.

(b) Consignees should report promptly to the chief inspector, Bureau of Explosives, all instances of broken or defective containers in shipments of dangerous articles received by them.

#### SECTION I. INFORMATION AND DEFINITIONS.

1800. For transportation purposes dangerous articles other than explosives are divided into the following groups:

1. *Forbidden articles.*
2. *Acceptable articles.*

##### GROUP 1.—FORBIDDEN ARTICLES.

1801. The following are *forbidden articles*:

(a) Outside packages containing in the same compartment interior packages, the mixture of whose contents would be liable to cause a dangerous evolution of heat, gas, or corrosive materials.

(b) Cylinders containing gases capable of combining chemically.

(c) Packages containing dangerous articles in a leaking condition or in such an insecure condition as to make leakage probable during transit.

(d) Rags or cotton waste oily with more than 5 per cent of vegetable or animal oil, or wet rags.

(e) Charcoal screenings from wet charcoal, or wet screenings, or screenings that have been wet. (See par. 1833 (c).)

(f) Dangerous articles not properly packed, marked, labeled, described, and certified.

(g) Iron sponge and spent oxide that has not been properly oxidized during manufacture.

## GROUP 2.—ACCEPTABLE ARTICLES.

### Definitions

#### *Inflammable Liquids—Red Label.*

1802. This group includes any liquid or liquid mixture that gives off inflammable vapors (as determined by flash point from Tagliabue's open cup tester, as used for test of burning oils) at or below a temperature of 80° F.

#### *Inflammable Solids—Yellow Label.*

1803. This group includes all substances other than those classified as explosives that are liable under conditions incident to transportation to cause fires by self-ignition through friction, through absorption of moisture, or through spontaneous chemical changes.

#### *Oxidizing Materials—Yellow Label.*

1804. This group includes all substances, such as chlorates, permanganates, peroxides, and nitrates, that yield oxygen readily to stimulate the combustion of organic matter.

#### *Corrosive Liquids—White Label.*

1805. This group includes the strong mineral acids (in strength greater than one-half concentrated, i. e., 47 per cent sulphuric, 34 per cent nitric, 20 per cent hydrochloric) and other strongly corrosive liquids that are liable to cause fires when mixed with chemicals or with organic matter, or are liable, in case of leakage from their shipping containers, to damage other freight materially.

#### *Compressed Gases—Red or Green (Gas) Label.*

1806. This group includes all inflammable or non-inflammable gases assembled for shipment under pressure exceeding 25 pounds per square inch, except when such gases are in cylinders or tubes not exceeding  $\frac{7}{8}$  inch outside diameter and of not more than 4 fluid ounces water capacity.

### LIST OF PRINCIPAL DANGEROUS ARTICLES.

1807. (a) The following list shows the names of well-known articles in general use, other than explosives, that are

dangerous; the kind of label required on outside packages; the quantities that may be shipped in one outside package without a label when certified and marked "No label required," and the label exemptions on account of specified packing. (See column 5 of list.)

(b) When a shipment described under a name not in the following list is defined as a dangerous one by paragraphs 1802 to 1806, inclusive, the shipper must inform the carrier of the fact by use of the proper label prescribed herein, and the shipping order must show the certificate prescribed by paragraph 1867. The maximum quantity of any such article shipped in one outside package, without label, when certified and marked "No label required," except as specified herein, must not exceed the limit prescribed by column 3 of the list for dangerous articles of similar flash point or characteristic.

(c) Inflammable liquids as defined by paragraph 1802, in securely closed glass, earthenware, or metal containers of not exceeding one pint capacity each, when flash point is  $20^{\circ}$  F., or lower, and of not exceeding one quart capacity when flash point is above  $20^{\circ}$  F., packed and cushioned in fiberboard or corrugated strawboard containers, wooden boxes, kegs, or barrels, complying with shipping container specifications that apply, may be shipped without labels when certified and marked "No label required."

(d) A shipment described under a definite and proper name not in the following list and on a shipping order with no notation as to labels applied and no shipper's certificate, will be assumed by the carrier in the absence of knowledge to the contrary, to be not dangerous under these regulations.

(e) When articles described under names in the following list marked (\*) are not dangerous under the regulations, the shipper must, unless otherwise provided in said list, state on his shipping order, as a part of the description of such article "No label required," and must also furnish the certificate prescribed by paragraph 1867 and mark the package "No label required."

(f) When several dangerous articles are placed in one outside package without violating these regulations, labels must be applied, when the combined quantity of the articles of any one group exceeds the lowest limit prescribed by column 3 for any of the articles of that group that are included.

(g) When dangerous articles requiring the red label are shipped in the same outside package with dangerous articles requiring yellow or white labels, the outside package must be labeled with the red label only

## SECTION II. RULES FOR PACKING.

1821. Dangerous articles for which the yellow and white labels, respectively, are prescribed must not be packed in the same package, unless the bottle containing the corrosive liquid is cushioned by incombustible absorbent material in tightly closed metal containers, as prescribed by paragraph 1851. Cylinders of compressed gases must not be packed with other articles.

1822. (a) The construction of barrels, drums, boxes, cans, carboys, or other containers purchased subsequent to March 31, 1912, and used in shipping dangerous articles other than explosives must conform to specifications approved by the Interstate Commerce Commission that apply; and each container must be stamped, labeled or marked "Complies with I. C. C. Spec'n No. —," or equivalent marking as stated in the specification.

(b) In addition to standing the tests prescribed, the design and construction of packages must be such as to prevent the occurrence in individual packages of defects that permit leakage of their contents under the ordinary conditions incident to transportation. The results of experience, gained by an examination of damaged or broken packages on arrival at destination, must be reported to and recorded by the Bureau of Explosives, to the end that further use of any particular kind of package shown by experience to be inefficient may be prohibited by the Commission.

(c) Pending approval and promulgation by the Commission of specifications for types of shipping containers other than those for which specifications are published herein, containers may be used which after investigation made by the Bureau of Explosives, or by other competent testing laboratory in the presence of a representative of the Bureau of Explosives, are shown to possess the general efficiency and the protection against leakage of contents afforded by the standard types of corresponding capacity described in the specifications published herein, provided they are labeled or marked to show compliance with this requirement.

(d) Tank cars used for the shipment of dangerous articles other than explosives must comply with Master Car Builders' rules, and a tank car that leaks or one that has any defect which would make leakage during transit probable or that has not been tested and stenciled in compliance with Master Car Builders' rules must not be used for the shipment of any inflammable liquid.

(e) The tanks and their fittings must be examined by the

shipper to see that they are in proper condition for loading. Tanks must be examined for evidence of previous leaks; safety and outlet valves, dome covers and outlet-valve caps must be in proper condition before loading; after loading, tanks must not show any dropping of liquid contents at the seams or rivets, and should such dropping appear cars must be properly repaired; outlet valves must not permit more than a dropping of the liquid with valve caps off, otherwise valve must be reground and repaired. Dome covers and valve caps provided with suitable gaskets, must be properly screwed in place before cars are tendered to the carrier.

(f) Loaded tank cars tendered for shipment must be inspected by the carrier to see that they are not leaking, that the air and hand brakes, journal boxes, trucks and safety appliances are in proper condition for service, and that the car has been tested within limits prescribed by Master Car Builders' rules.

(g) Tests of all tank cars and their safety valves, as made in compliance with Master Car Builders' rules, must be certified by the party making the tests to the owner of the tank car and to the chief inspector, Bureau of Explosives; and this certification must show the initials and number of the tank car, the service for which it is suitable, the date of test, place of test, and by whom made.

#### INFLAMMABLE LIQUIDS—RED LABEL.

1824. (a) All inflammable liquids must be shipped in packages complying with specifications that apply as follows:

(b) In tightly closed metal cans of not exceeding 10 gallons capacity, packed in wooden boxes complying with Specification No. 2 or cushioned in wooden barrels or kegs complying with Specification No. 11.

(c) In well-stoppered glass or earthenware vessels of not exceeding 1 gallon capacity, cushioned in wooden boxes complying with Specification No. 2 or cushioned in wooden barrels or kegs complying with Specification No. 11, or in a well-stoppered glass or earthenware vessel of not exceeding 5 gallons capacity, well cushioned in a wooden box and not more than one such vessel in the box. The completed package must comply with swing and drop tests prescribed for boxed carboys by Specification No. 1.

(d) In well-stoppered glass, earthenware or metal vessels of not exceeding 1 pint capacity when flash point is 20° F., or lower, and 1 quart capacity when flash point is above 20° F., cushioned in fiber board or corrugated strawboard containers complying with Specification No. 24.

(e) In wooden kits of not exceeding 10 gallons capacity, packed in wooden boxes complying with Specification No. 2, or cushioned in wooden barrels or kegs complying with Specification No. 11.

(f) In metal-jacketed cans of not exceeding 10 gallons capacity, complying with Specification No. 23.

(g) In well-stoppered carboys of not exceeding 13 gallons capacity, cushioned in wooden boxes complying with Specification No. 1.

(h) In wooden barrels or kegs complying with Specification No. 10 when the flash point of the liquid is not lower than 20° F., or in wooden barrels or kegs complying with Specification No. 9 when the flash point is lower than 20° F., unless otherwise provided in the tariffs under which shipment moves.

(i) In metal barrels or drums complying with Specification No. 5.

(j) In tank cars complying with Master Car Builders' specifications, provided the vapor tension of the inflammable liquid corresponding to a temperature of 100° F. (90° F. Nov. 1 to Mar. 1) does not exceed 10 pounds per square inch. After May 1, 1915, a tank car must not be used for shipping inflammable liquids with flash point lower than 20° F., unless it has been tested with cold-water pressure of 60 pounds per square inch and stenciled as required by Master Car Builders' rules.

(k) Liquid condensates from natural gas or from casing-head gas of petroleum oil wells whose vapor tension at 100 degrees F. (90 degrees F. November 1st to March 1st) exceeds 10 pounds per square inch, must be described as Liquefied Petroleum Gas. In measuring the vapor tension the container of the sample may be vented momentarily at a temperature of 70 degrees F. This product must be shipped in metal drums or barrels which comply with specification No. 5 and have a nominal capacity not exceeding 55 gallons; or in special insulated tank cars approved for this service by the Master Car Builders' Association, provided the vapor tension as above defined does not exceed 15 pounds per square inch. When the vapor tension as above defined exceeds 25 pounds per square inch, cylinders as prescribed for compressed gases (see paragraphs 1861 to 1863, inclusive) must be used.

When the condensate, blended or unblended with other products, has a vapor tension as above defined, not exceeding 10 pounds per square inch, and is shipped as "gasoline" in an ordinary tank car, 60-pound test class, defined in Master Car Builders' Association Specifications for Tank Cars, the safety valves of such a car must be set to operate at 25 pounds per

square inch, with a tolerance of one pound above or below; and the mechanical arrangements for closing the dome cover of this car must either be such as to make it practically impossible to remove the dome cover while the interior of the car is subjected to pressure or suitable vents that will be opened automatically by starting the operation of removing the dome cover must be provided. The shipper must attach securely and conspicuously to the dome and to the dome cover white placards conforming to samples furnished by the Chief Inspector of the Bureau of Explosives, cautioning all railway and refinery employees not to remove the dome cover while interior pressure exists. The presence of these dome placards must be noted on the shipping order, and on the billing accompanying the car. This regulation must be made effective not later than May 15, 1916, at all points where this condensate from natural gas or "casinghead gas" is produced and shipped in a blended or unblended state; and the requirement for construction of dome covers and valve setting at 25 pounds must be made effective not later than January 1, 1917, for all tank car shipments of inflammable liquids with flash points lower than 20 degrees F.

When the "blowing" of safety valves of a car containing inflammable liquids is noted, any available means for cooling the car shell and contents, such as spraying with water, should be utilized; and, if practicable, the car should be moved to an isolated point, to minimize the fire risk. Covering the safety valves with wet cloth, wet blankets or wet gunny sacks will decrease the danger of igniting vapors escaping from a "blowing" valve. The burning of these vapors at the safety valve is not liable to cause an explosion. The valves are designed to permit, in emergencies, the burning in this way of the entire contents of the car.

(1) Carbon bisulphide in interior packages of capacity greater than  $\frac{1}{2}$  gallon must be shipped in metal cans of not less than 28 gauge, boxed, complying with Specification No. 2; or in metal barrels or drums complying with Specification No. 5, such barrels or drums after January 1, 1916, not to exceed 55 gallons capacity. Carbon bisulphide may also be shipped in tank cars complying with paragraph 1824 (j).

1825. (a) Packages containing inflammable liquids must not be entirely filled. Sufficient interior space must be left vacant to prevent leakage or distortion of containers, due to increase of temperature during transit. In all such packages, this vacant space must not be less than 2 per cent of the total capacity of the container. In tank cars the vacant space must not be less than 2 per cent of the total capacity of the tank,

i. e., the shell and dome capacity, combined. If the dome of tank cars does not provide this 2 per cent, sufficient vacant space must be left in the shell of the tank to make up the difference.

(b) In packages containing alcohol, cologne spirits, high wines or other distilled spirits, the vacant interior space or allowance for wantage or ullage must conform to the United States Internal Revenue Regulations.

1826. Interior packages, containing 1 quart or more of an inflammable liquid, must be packed with their filling holes up and the top of the outside package must be plainly marked "THIS SIDE UP."

1827. Wooden-jacketed cans and wooden kits must not be used for the shipment of inflammable liquids, except as inside containers as provided by Specification No. 2 or 11.

#### Rule 44.

1	April 20, 1917.
---	-----------------

(Cancels Paragraph 1824 (k) of Rule 44, page 52, Classification 54.)

1824 (k) Liquid condensates from natural gas or from casinghead gas of petroleum oil wells whose vapor tension at 100 degrees F. (90 degrees F. November 1 to March 1) exceeds 10 pounds per square inch, must be described as Liquefied Petroleum Gas. In measuring the vapor tension the container of the sample may be vented momentarily at a temperature of 70 degrees F. This product must be shipped in metal drums or barrels which comply with specification No. 5 and have a nominal capacity not exceeding 55 gallons; or in special insulated tank cars approved for this service by the Master Car Builders' Association, provided the vapor tension as above defined does not exceed 15 pounds per square inch from April 1 to October 1, and 20 pounds per square inch from October 1 to April 1. When the vapor tension as above defined exceed 25 pounds per square inch, cylinders as prescribed for compressed gases (see paragraphs 1861 to 1863, inclusive) must be used.

When the condensate, blended or unblended with other products, has a vapor tension as above defined, not exceeding 10

pounds per square inch, and is shipped as "gasoline" in an ordinary tank car, 60-pound test class, defined in Master Car Builders' Association Specifications for Tank Cars, the safety valves of such a car must be set to operate at 25 pounds per square inch, with a tolerance of one pound above or below; and the mechanical arrangements for closing the dome cover of this car must either be such as to make it practically impossible to remove the dome cover while the interior of the car is subjected to pressure or suitable vents that will be opened automatically by starting the operation of removing the dome cover must be provided. The shipper must attach securely and conspicuously to the dome and to the dome cover white placards conforming to samples furnished by the Chief Inspector of the Bureau of Explosives, cautioning all railway and refinery employees not to remove the dome cover while interior pressure exists. The presence of these dome placards must be noted on the shipping order, and on the billing accompanying the car. This regulation must be made effective not later than May 15, 1916, at all points where this condensate from natural gas or "casinghead gas" is produced and shipped in a blended or unblended state; and the requirement for construction of dome covers and valve setting at 25 pounds must be made effective not later than April 1, 1917, for all tank car shipments of inflammable liquids with flash points lower than 20 degrees F.

When the "blowing" of safety valves of a car containing inflammable liquids is noted any available means for cooling the car shell and contents, such as spraying with water, should be utilized; and if practicable, the car should be moved to an isolated point, to minimize the fire risk. Covering the safety valves with wet cloth, wet blankets or wet gunny sacks will decrease the danger of igniting vapors escaping from a "blowing" valve. The burning of

these vapors at the safety valve is not liable to cause an explosion. The valves are designed to permit, in emergencies, the burning in this way of the entire contents of the car.

Rule 44.

1 April 20, 1917.

(Re-issue: Item 1, page 6, which cancelled Paragraph 1824 (k) of Rule 44, page 52, Classification 54.)

1824 (k) Liquid condensates from natural gas or from casinghead gas of petroleum oil wells whose vapor tension at 100 degrees F. (90 degrees F. November 1 to March 1) exceeds 10 pounds per square inch, must be described as Liquefied Petroleum Gas. In measuring the vapor tension the container of the sample may be vented momentarily at a temperature of 70 degrees F. This product must be shipped in metal drums or barrels which comply with specification No. 5 and have a nominal capacity not exceeding 55 gallons; or in special insulated tank cars approved for this service by the Master Car Builders' Association, provided the vapor tension as above defined does not exceed 15 pounds per square inch from April 1 to October 1, and 20 pounds per square inch from October 1 to April 1. When the vapor tension as above defined exceed 25 pounds per square inch, cylinders as prescribed for compressed gases (see paragraphs 1861 to 1863, inclusive) must be used.

When the condensate, blended or unblended with other products, has a vapor tension as above defined, not exceeding 10 pounds per square inch, and is shipped as "gasoline" in an ordinary tank car, 60-

pound test class, defined in Master Car Builders' Association Specifications for Tank Cars, the safety valves of such a car must be set to operate at 25 pounds per square inch, with a tolerance of one pound above or below; and the mechanical arrangements for closing the dome cover of this car must either be such as to make it practically impossible to remove the dome cover while the interior of the car is subjected to pressure or suitable vents that will be opened automatically by starting the operation of removing the dome cover must be provided. The shipper must attach securely and conspicuously to the dome and to the dome cover white placards conforming to samples furnished by the Chief Inspector of the Bureau of Explosives, cautioning all railway and refinery employees not to remove the dome cover while interior pressure exists. The presence of these dome placards must be noted on the shipping order, and on the billing accompanying the car. This regulation must be made effective not later than May 15, 1916, at all points where this condensate from natural gas or "casinghead gas" is produced and shipped in a blended or unblended state; and the requirement for construction of dome covers and valve setting at 25 pounds must be made effective not later than April 1, 1917, for all tank car shipments of inflammable liquids with flash points lower than 20 degrees F.

When the "blowing" of safety valves of a car containing inflammable liquids is noted any available means for cooling the car shell and contents, such as spraying with water, should be utilized; and if practicable, the car should be moved to an isolated point, to minimize the fire risk. Covering the safety valves with wet cloth, wet blankets or wet gunny sacks will decrease the danger of igniting vapors escaping from a "blowing" valve. The burning of these vapors at the safety valve is not liable

to cause an explosion. The valves are designed to permit, in emergencies, the burning in this way of the entire contents of the car.

#### Government's Exhibit 40.

Only two Supplements to this Tariff will be in effect at any time.

I. C. C. No. 1186. For cancellations, see page 2.

SOUTHWESTERN LINES TARIFF NO. 79

For cancellations, see page 2.

For Individual Lines Tariff Numbers, see page 2.

Local, joint and proportional tariff, applying on petroleum and petroleum products, asphalt, asphalt rock, asphalt tar, asphaltum, axle grease and petroleum liquid asphalt, carloads, (see page 8) from Oklahoma producing points (shown on pages 9 to 11, inclusive) to interstate points (see page 12 to 14, inclusive).

Governed, except as otherwise provided herein, by Western Classification No. 54 (R. C. Fyfe's I. C. C. No. 12), or re-issues thereof.

The rates named in this tariff are subject to the conditions of the carrier's bills of lading.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates in this tariff are not made applicable FROM all intermediate points. Upon reasonable request therefor, rates which will not exceed those in effect, and specifically published in this tariff from the next more distant point on the same railroad, will, under authority granted by the Interstate Commerce Commission, be established by the carriers parties to this tariff from any intermediate point, upon one day's notice to the Commission and to the public.

This tariff contains rates that are higher for shorter distances than for longer distances over the same route. Such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Orders, as indicated in individual items, herein.

Issued March 19, 1917. *Effective May 2, 1917* (except as noted on pages 29, 34 to 37, 67, 70 to 72, inclusive, and 87).

## GENERAL APPLICATION OF RATES.

ITEM NO.	SUBJECT	APPLICATION
5	Commodity Descriptions	Where reference is made to this Item the rates apply on: (For rates, see pages * * * 39 to 43 inclusive, * * *)  Petroleum Oil and its Products * * * listed under head of "Petroleum and Petroleum Products," and rated Fifth class or lower in current Western Classification; * * * in straight or mixed carloads; minimum weight 26,000 pounds, except that freight charges on shipments transported in tank cars will be determined in the manner prescribed in Item No. 90, or re-issues (See Note).  NOTE.—Rates to all points—except * * * Texas points—will also apply on Liquefied Petroleum Gas, in iron barrels, iron drums, iron cylinders, or specially insulated tank cars, subject to the conditions specified in Rule 44-K of current Western Classification.

Page 17.

## RULES AND CONDITIONS.

SUBJECT	ITEM NO.	RULES
Extent to which rates are governed by Western Classification (R.N.J-1694)	57	The ratings, rules and regulations, estimated and minimum weights, shipping and packing requirements, allowances and privileges, or other provisions or conditions authorized by this Tariff, abrogate and supersede those of Western Classification, in conflict. When the ratings in this Tariff are silent as to rules and regulations, estimated and minimum weights, shipping and packing requirements, allowances and privileges or other provisions or conditions, the ratings which are prescribed in such commodity items shall be subject to the terms (including estimated and minimum weights, shipping and packing requirements, or other provisions or conditions), prescribed for in connection with the ratings in the current Western Classification, on the same commodity.

Page 18.

## RULES AND CONDITIONS.

SUBJECT	ITEM NO.	RULES
Minimum Weights on Commodities in Tank Cars.	90	1. The weights and charges on shipments in tank cars, shall be based on the full shell capacity of the tank (as shown in United States and Canadian Railroads' Circular No. 6-K, E. B. Boyd's I. C. C. No. A-722, or re-issues), at actual or estimated weights provided in current Western Classification—except as provided in Sections 2, 3 and 4—unless the weight carrying capacity of the car trucks, is less, in which case the actual weight, subject to the weight carrying capacity of the car trucks will govern as a minimum.

2. When shipments of Inflammable Liquids, subject to Section 1825, Rule 44 of current Western Classification, are loaded in tank cars, the domes of which are not of sufficient capacity to cover the two (2) per cent outage as required, an allowance will be made from the shell capacity of tank, to cover the difference between the dome capacity and the two (2) per cent outage. Shippers must show on bills of lading or shipping receipt both the shell and dome capacity of car.

Rates and charges named in this supplement are not subject to increase shown in special supplement (Supplement No. 2), effective July 1, 1917.

*Supplement No. 3 to I. C. C. No. 1186.* Supplements Nos. 1, 2 and 3 contain all changes from the original tariff that are effective on July 14, 1917.

#### SOUTHWESTERN LINES TARIFF NO. 79

For Individual Lines Tariff Numbers, see page 2.

#### *Supplement No. 3*

Supplements Nos. 1, 2 and 3 contain all changes from the original tariff that are effective on July 14, 1917.

Local, joint and proportional tariff, applying on petroleum and petroleum products, asphalt, asphalt rock, asphalt tar, asphaltum, axle grease and petroleum liquid asphalt, carloads, (see page 8 of tariff) from Oklahoma producing points (shown on pages 9 to 11, inclusive, of tariff, as amended) to interstate points (see pages 12 to 14, inclusive, of tariff).

Governed, except as otherwise provided herein, by Western Classification No. 54 (R. C. Fyfe's I. C. C. No. 12), or re-issues thereof.

The rates named in this tariff are subject to the conditions of the carrier's bills of lading.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates in this tariff are not made applicable FROM all intermediate points. Upon reasonable request therefor, rates which will not exceed those in effect, and specifically published in this tariff from the next more distant point on the same railroad, will, under authority granted by the Interstate Commerce Commission, be established by the carriers parties to this tariff from any intermediate point, upon one day's notice to the Commission and to the public.

This tariff contains rates that are higher for shorter distances than for longer distances over the same route. Such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Orders, as indicated in individual items, herein.

Issued May 29, 1917. *Effective July 10, 1917* (except as noted on page 3, where reference is made to notes 12 and 15; page 7, where reference is made to note 1; page 8, and in items 289, 289A, 342 and 342-A).

Issued by F. A. Leland, Agent, St. Louis, Mo.  
Authority No. 25314.

(Stamped:) Received; Interstate Commerce Commission; 38907; May 31 1917; Division of Tariffs.

Minimum weights on commodities in tank cars.	90	<p>1. The weights and charges on shipments in tank cars, shall be based on the full shell capacity of the tank (as shown in United States and Canadian Railroads' Circular No. 4-M, E. B. Boyd's I. C. C. No. A-826, or re-issues), at actual or estimated weights provided in current Western Classification—except as provided in Sections 2, 3 and 4—unless the weight carrying capacity of the car trucks is less, in which case the actual weight, subject to the weight carrying capacity of the car trucks will govern as a minimum.</p> <p>2. When shipments of Inflammable Liquids, subject to Section 1825, Rule 44 of current Western Classification, are loaded in tank cars, the domes of which are not of sufficient capacity to cover the two (2) per cent outage as required, an allowance will be made from the shell capacity of tank, to cover the difference between the dome capacity and the two (2) per cent outage. Shippers must show on bills of lading or shipping receipt both the shell and dome capacity of car.</p>

*Special Supplement to I. C. C. Nos. shown herein*

**SPECIAL SUPPLEMENT TO TARIFFS**

Issued by F A. Leland, Agent.

Applying in connection with participating carriers shown in tariffs and supplements thereto enumerated herein.

**INCREASE IN FREIGHT RATES.**

Freight rates name din tariffs and supplements thereto, listed on pages 7 to 9, inclusive, are hereby increased to the rates shown in column 8 of rate table on pages 4 to 6, inclusive. (See application of rates, page 2.)

Increased joint rates and charges contained in this schedule are filed on one day's notice under authority of Interstate Commerce Commission's Fifteenth Section Order No. 666 of May 27, 1918, without formal hearing, which approval shall not affect any subsequent proceeding relative thereto.

This schedule contains rates that are departures from the terms of the amended Fourth Section of the Act of Regulate Commerce under authority of the Interstate Commerce Commission, Fourth Section Order No. 7316, of May 27, 1918.

The form of this supplement is permitted by authority of the Interstate Commerce Commission, Special Permission No. 45950, of May 27, 1918.

Issued June 18, 1918. *Effective June 25, 1918.*

The rates made effective by this schedule are initiated by the President f the United States through the Director General, United States Railroad Administration, and apply to interstate traffic only.

This schedule is published and filed on one day's notice with the Interstate Commerce Commission under General Order No. 28 of the Director General, United States Railroad Administration, dated May 25, 1918, and amended June 12, 1918.

Issued by F. A. Leland, Agent, St. Louis, Mo.

Authority No. 26007.

(Stamped:) Received; Interstate Commerce Commission; 34213; Jun 21 1918; Division of Tariffs. *Supt. No. 4; I. C. C. No. 1219.*

## RULES.

### RATES IN CENTS (EXCEPT CENTS PER CAR).

1. Where rates named in tariffs or prior supplements thereto, as enumerated herein, in cents per hundred pounds, per package, per ton, per shipment, or other unit (except rates in cents per car—see Rule 6) are included in the figures shown in Column A, the rates shown opposite thereto in Column B will apply.

### APPLICATION OF RATES.

Effective June 25, 1918, all rates then in effect named in tariffs enumerated herein and in prior supplements thereto, as indicated, to each of which tariffs this is a special supplement, are increased to the rates shown in Column B in Table of Rates on pages 4 to 6, inclusive, hereof. \* \* \*

### LIST OF TARIFFS SUPPLEMENTED HEREBY.

NOTE.—The increases made by this supplement apply to the entire rates as named in the tariffs listed below, whether such rates are published as specific totals or are made up by use of differentials or arbitrarilers.

I. C. C. No.	Supplement No.	Southwestern Lines No.	Supplements Containing All Changes from the Original Tariff
*	*	*	*
1219	4	79-A	2, 3, 4
*	*	*	*

Rates and charges named in this supplement are not subject to increases shown in Special Supplement No. 4.

*Supplement No. 5 to I. C. C. No. 1219.* Supplements Nos. 2, 3, 4 and 5 contain all changes from the original tariff that are effective on the date hereof.

**"UNITED STATES RAILROAD ADMINISTRATION,  
W. G. McAdoo, Director General of Railroads"**

**SOUTHWESTERN LINES TARIFF NO. 79-A**

For Individual Lines Tariff Numbers, see page 2.

*Supplement No. 5*

Supplements Nos. 2, 3, 4 and 5 contain all changes from the original tariff that are effective on the date hereof.

Local, joint and proportional tariff, applying on petroleum and petroleum products, asphalt, asphalt rock, asphalt tar, asphaltum, axle grease and petroleum liquid asphalt, carloads (see page 8 of tariff), from Oklahoma producing points and Ft. Smith, Ark. (shown on pages 10 to 13, inclusive, of tariff, as amended), to interstate points (see pages 13 to 16, inclusive, of tariff).

Governed, except as otherwise provided herein, by Western Classification No. 55 (R. C. Fyfe's I. C. C. No. 13), or re-issues thereof.

The rates named in this tariff are subject to the conditions of the carrier's bills of lading.

By authority of rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates in this tariff are not made applicable FROM all intermediate points. Upon reasonable request therefor, rates which will not exceed those in effect, and specifically published in this tariff from the next more distant point on the same railroad, will, under authority granted by the Interstate Commerce Commission, be established by the carriers parties of this tariff from any intermediate point, upon one day's notice to the Commission and to the public.

This tariff contains rates that are higher for shorter distances than for longer distances over the same route. Such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Orders, as indicated in individual items herein.

Issued July 24, 1918. *Effective July 29, 1918.*

Published for the Director General of Railroads and filed on one day's notice with the Interstate Commerce Commission under Freight Rate Authority No. 96 of the Director, Division of Traffic, United States Railroad Administration, dated July 11, 1918.

The form of this supplement is permitted by authority of Interstate Commerce Commission Special Permission No. 47201 of July 18, 1918.

Issued by F. A. Leland, Agent, St. Louis, Mo.

Authority No. 26052.

(Stamped:) Received; Interstate Commerce Commission; 49097; Jul 27, 1918; Division of Tariffs.

## RULES AND CONDITIONS OF THE WESTERN CLASSIFICATION.

### RULE 32.

Section 5. When shipments of inflammable liquids subject to Section 1825, Rule 44, are loaded in tank cars, the domes of which are not of sufficient capacity to cover the two (2) per cent outage as required, an allowance will be made from the shell capacity of tank to cover the difference between the dome capacity and the two (2) per cent outage.

Shippers must show on bills of lading or shipping receipt both the shell and dome capacity of car.

## RULE 44.

*Interstate Commerce Commission*

## REGULATIONS

for the

*Transportation of Dangerous Articles Other Than  
Explosives by Freight.*

Prescribed under the act of March 4, 1909, and section 15 of the act to regulate commerce, as amended June 18, 1910. Revisor formulated and published July 2, 1914, effective October 1, 1914, and superseding regulations published January 1, 1912.

## GENERAL NOTICE.

1701. Special precautions are necessary in preparing for shipment packages of dangerous articles other than explosives, and in handling these packages during transit. Any failure of a shipper, or of a carrier, to perform the duties imposed upon him in this respect may be the actual or a contributory cause not only of destructive fires but of disastrous explosions, since large quantities of explosives are transported frequently through thickly populated districts and in trains containing cars loaded with other dangerous articles.

1702. Sections 235 and 236 of the act of March 4, 1909, require the shipper of dangerous articles to describe and mark his packages properly and to inform the agent of the carrier of the true character of their contents. Heavy penalties are provided for the shipper who, knowingly, solicits the transportation of dangerous articles without complying with these requirements, as well as for the carrier that knowingly transports them.

1703. To promote the uniform enforcement of law and to minimize the dangers to life and property incident to the transportation by land in interstate commerce of dangerous articles other than explosives, the following regulations are prescribed to define these articles for freight transportation purposes, to state the precautions that must be observed by the shipper in preparing them for shipment, and by the carrier in handling them while in transit. It is the duty of each such carrier and shipper to make the prescribed regulations effective and to thoroughly instruct their employees in relation thereto.

1704. These regulations apply to all shipments of dangerous articles other than explosives, including carriers' material and supplies.

1705. Specifications as to containers, methods of packing for shipment, etc., will be considered and prescribed from time to time. Orders prescribing such specifications will be given effective dates as conditions and investigations may appear to warrant.

1706. The Bureau for the Safe Transportation of Explosives and other Dangerous Articles, hereinafter called Bureau of Explosives, organized by the railways under the auspices of the American Railway Association, is an efficient bureau in charge of an expert chief inspector. This bureau will make inspections and conduct investigations and will confer with manufacturers and shippers with a view to determining what specifications and regulations will within reasonable limits afford the highest degree of safety in packing and preparing these dangerous articles for shipment and in transporting the same. The Commission will seek to avail itself of the expert knowledge thus developed and, in formulating amendments to these regulations or specifications supplemental thereto, while not bound thereby, will give due weight to such expert opinions.

#### GENERAL RULES.

1711. Carriers that are subject to the act to regulate commerce must not receive shipments of articles defined as dangerous by these regulations when the shipments are not packed, marked, labeled, described, and certified as prescribed herein. The method of manufacture and packing of articles defined as dangerous by these regulations, so far as it affects safe transportation, must be open to inspection by a duly authorized representative of the initial carrier or of the Bureau of Explosives.

1712. All shipments of articles subject to these regulations offered for transportation in interstate commerce must be properly described by the shipper in his shipping order and bill of lading under the specific or general name provided for the description of such freight by the carrier's classification and tariff governing.

The same description of contents must be marked plainly on the outside of each package.

In less-than-carload shipments each package must be marked also to show plainly the name and address of the consignee. This address, the name of contents, and the required label or "no label required" marking, should be as near together as practicable.

1713. All shipments of articles defined as dangerous by these regulations, and for which detailed instructions for pack-

ing are not given herein, must be securely packed in containers strong enough to stand without rupture or leakage of contents all ordinary shocks incident to reasonably careful handling during transit. It is the duty of shippers, where leakage from their shipping containers is known to be a probable source of fire or material damage to other freight, to exercise special care in constructing shipping containers for such articles, even though their names do not appear in the list of dangerous articles, paragraph 1807.

1714. Carriers must forward shipments of dangerous articles other than explosives promptly and within 48 hours after acceptance at originating point or receipt at transfer station or at interchange point, and consignees must remove such shipments from the carriers' property within 48 hours after notice of arrival at destination, Sundays and holidays not included.

1715. (a) *Serious violations of these regulations, such as the discovery of leaking or broken packages of dangerous articles, and accidents or fires in connection with the transportation or storage on carrier's property of dangerous articles, must be reported by the carrier to the chief inspector of the Bureau of Explosives, 30 Vessey Street, New York City.*

(b) Consignees should report promptly to the chief inspector, Bureau of Explosives, all instances of broken or defective containers in shipments of dangerous articles received by them.

#### SECTION I. INFORMATION AND DEFINITIONS.

1800. For transportation purposes dangerous articles other than explosives are divided into the following groups:

1. *Forbidden articles.*
2. *Acceptable articles.*

##### GROUP 1.—FORBIDDEN ARTICLES.

1801. The following are *forbidden articles*:

(a) Outside packages containing in the same compartment interior packages, the mixture of whose contents would be liable to cause a dangerous evolution of heat, gas, or corrosive materials.

(b) Cylinders containing gases capable of combining chemically.

(c) Packages containing dangerous articles in a leaking condition or in such an insecure condition as to make leakage probable during transit.

(d) Rags or cotton waste oily with more than 5 per cent of vegetable or animal oil, or wet rags.

(e) Charcoal screenings from wet charcoal, or wet screenings, or screenings that have been wet. (See par. 1833 (c).)

(f) Dangerous articles not properly packed, marked, labeled, described, and certified.

(g) Iron sponge and spent oxide that has not been properly oxidized during manufacture.

GROUP 2.—ACCEPTABLE ARTICLES.

Definitions

*Inflammable Liquids—Red Label.*

1802. This group includes any liquid or liquid mixture that gives off inflammable vapors (as determined by flash point from Tagliabue's open cup tester, as used for test of burning oils) at or below a temperature of 80° F.

*Inflammable Solids—Yellow Label.*

1803. This group includes all substances other than those classified as explosives that are liable under conditions incident to transportation to cause fires by self-ignition through friction, through absorption of moisture, or through spontaneous chemical changes.

*Oxidizing Materials—Yellow Label.*

1804. This group includes all substances, such as chlorates, permanganates, peroxides, and nitrates, that yield oxygen readily to stimulate the combustion of organic matter.

*Corrosive Liquids—White Label.*

1805. This group includes the strong mineral acids (in strength greater than one-half concentrated, i. e., 47 per cent sulphuric, 34 per cent nitric, 20 per cent hydrochloric) and other strongly corrosive liquids that are liable to cause fires when mixed with chemicals or with organic matter, or are liable, in case of leakage from their shipping containers, to damage other freight materially.

*Compressed Gases—Red or Green (Gas) Label.*

1806. This group includes all inflammable or non-inflammable gases assembled for shipment under pressure exceeding 25 pounds per square inch, except when such gases are in cylinders or tubes not exceeding  $\frac{7}{8}$  inch outside diameter and of not more than 4 fluid ounces water capacity.

LIST OF PRINCIPAL DANGEROUS ARTICLES.

1807. (a) The following list shows the names of well-known articles in general use, other than explosives, that are

dangerous; the kind of label required on outside packages; the quantities that may be shipped in one outside package without a label when certified and marked "No label required," and the label exemptions on account of specified packing. (See column 5 of list.)

(b) When a shipment described under a name not in the following list is defined as a dangerous one by paragraphs 1802 to 1806, inclusive, the shipper must inform the carrier of the fact by use of the proper label prescribed herein, and the shipping order must show the certificate prescribed by paragraph 1867. The maximum quantity of any such article shipped in one outside package, without label, when certified and marked "No label required," except as specified herein, must not exceed the limit prescribed by column 3 of the list for dangerous articles of similar flash point or characteristic.

(c) Inflammable liquids as defined by paragraph 1802, in securely closed glass, earthenware, or metal containers of not exceeding one pint capacity each, when flash point is 20° F., or lower, and of not exceeding one quart capacity when flash point is above 20° F., packed and cushioned in fiberboard or corrugated strawboard containers, wooden boxes, kegs, or barrels, complying with shipping container specifications that apply, may be shipped without labels when certified and marked "No label required."

(d) A shipment described under a definite and proper name not in the following list and on a shipping order with no notation as to labels applied and no shipper's certificate, will be assumed by the carrier in the absence of knowledge to the contrary, to be not dangerous under these regulations.

(e) When articles described under names in the following list marked (\*) are not dangerous under the regulations, the shipper must, unless otherwise provided in said list, state on his shipping order, as a part of the description of such article "No label required," and must also furnish the certificate prescribed by paragraph 1867 and mark the package "No label required."

(f) When several dangerous articles are placed in one outside package without violating these regulations, labels must be applied, when the combined quantity of the articles of any one group exceeds the lowest limit prescribed by column 3 for any of the articles of that group that are included.

(g) When dangerous articles requiring the red label are shipped in the same outside package with dangerous articles requiring yellow or white labels, the outside package must be labeled with the red label only.

## LIST OF PRINCIPAL DANGEROUS ARTICLES.

1 At or below.

## SECTION II. RULES FOR PACKING.

1821. Dangerous articles for which the yellow and white labels, respectively, are prescribed must not be packed in the same package, unless the bottle containing the corrosive liquid is cushioned by incombustible absorbent material in tightly closed metal containers, as prescribed by paragraph 1851. Cylinders of compressed gases must not be packed with other articles.

1822. (a) The construction of barrels, drums, boxes, cans, carboys, or other containers purchased subsequent to March 31, 1912, and used in shipping dangerous articles other than explosives must conform to specifications approved by the Interstate Commerce Commission that apply; and each container must be stamped, labeled or marked "Complies with I. C. C. Spec'n No. —," or equivalent marking as stated in the specification.

(b) In addition to standing the tests prescribed, the design and construction of packages must be such as to prevent the occurrence in individual packages of defects that permit leakage of their contents under the ordinary conditions incident to transportation. The results of experience, gained by an examination of damaged or broken packages on arrival at destination, must be reported to and recorded by the Bureau of Explosives, to the end that further use of any particular kind of package shown by experience to be inefficient may be prohibited by the Commission.

(c) Pending approval and promulgation by the Commission of specifications for types of shipping containers other than those for which specifications are published herein, containers may be used which after investigation made by the Bureau of Explosives, or by other competent testing laboratory in the presence of a representative of the Bureau of Explosives, are shown to possess the general efficiency and the protection against leakage of contents afforded by the standard types of corresponding capacity described in the specifications published herein, provided they are labeled or marked to show compliance with this requirement.

(d) Tank cars used for the shipment of dangerous articles other than explosives must comply with Master Car Builders' rules, and a tank car that leaks or one that has any defect which would make leakage during transit probable or that has not been tested and stenciled in compliance with Master Car Builders' rules must not be used for the shipment of any inflammable liquid.

(e) The tanks and their fittings must be examined by the shipper to see that they are in proper condition for loading.

Tanks must be examined for evidence of previous leaks; safety and outlet valves, dome covers and outlet-valve caps must be in proper condition before loading; after loading, tanks must not show any dropping of liquid contents at the seams or rivets, and should such dropping appear cars must be properly repaired; outlet valves must not permit more than a dropping of the liquid with valve caps off, otherwise valve must be reground and repaired. Dome covers and valve caps provided with suitable gaskets, must be properly screwed in place before cars are tendered to the carrier.

(f) Loaded tank cars tendered for shipment must be inspected by the carrier to see that they are not leaking, that the air and hand brakes, journal boxes, trucks and safety appliances are in proper condition for service, and that the car has been tested within limits prescribed by Master Car Builders' rules.

(g) Tests of all tank cars and their safety valves, as made in compliance with Master Car Builders' rules, must be certified by the party making the tests to the owner of the tank car and to the chief inspector, Bureau of Explosives; and this certification must show the initials and number of the tank car, the service for which it is suitable, the date of test, place of test, and by whom made.

#### INFLAMMABLE LIQUIDS—RED LABEL.

1824. (a) All inflammable liquids must be shipped in packages complying with specifications that apply as follows:

(b) In tightly closed metal cans of not exceeding 10 gallons capacity, packed in wooden boxes complying with Specification No. 2 or cushioned in wooden barrels or kegs complying with Specification No. 11.

(c) In well-stoppered glass or earthenware vessels of not exceeding 1 gallon capacity, cushioned in wooden boxes complying with Specification No. 2 or cushioned in wooden barrels or kegs complying with Specification No. 11, or in a well-stoppered glass or earthenware vessel of not exceeding 5 gallons capacity, well cushioned in a wooden box and not more than one such vessel in the box. The completed package must comply with swing and drop tests prescribed for boxed carboys by Specification No. 1.

(d) In well-stoppered glass, earthenware or metal vessels of not exceeding 1 pint capacity when flash point is 20° F., or lower, and 1 quart capacity when flash point is above 20° F., cushioned in fiber board or corrugated strawboard containers complying with Specification No. 24.

(e) In wooden kits of not exceeding 10 gallons capacity, packed in wooden boxes complying with Specification No. 2, or cushioned in wooden barrels or kegs complying with Specification No. 11.

(f) In metal-jacketed cans of not exceeding 10 gallons capacity, complying with Specification No. 23.

(g) In well-stoppered carboys of not exceeding 13 gallons capacity, cushioned in wooden boxes complying with Specification No. 1.

(h) In wooden barrels or kegs complying with Specification No. 10 when the flash point of the liquid is not lower than 20° F., or in wooden barrels or kegs complying with Specification No. 9 when the flash point is lower than 20° F., unless otherwise provided in the tariffs under which shipment moves.

(i) In metal barrels or drums complying with Specification No. 5.

(j) In tank cars complying with Master Car Builders' specifications, provided the vapor tension of the inflammable liquid corresponding to a temperature of 100° F. (90° F. Nov. 1 to Mar. 1) does not exceed 10 pounds per square inch. After May 1, 1915, a tank car must not be used for shipping inflammable liquids with flash point lower than 20° F., unless it has been tested with cold-water pressure of 60 pounds per square inch and stenciled as required by Master Car Builders' rules.

(k) Liquid condensates from natural gas or from casing-head gas of petroleum oil wells whose vapor tension at 100 degrees F. (90 degrees F. November 1st to March 1st) exceeds 10 pounds per square inch, must be described as Liquified Petroleum Gas. In measuring the vapor tension the container of the sample may be vented momentarily at a temperature of 70 degrees F. This product must be shipped in metal drums or barrels which comply with specification No. 5 and have a nominal capacity not exceeding 55 gallons; or in special insulated tank cars approved for this service by the Master Car Builders' Association, provided the vapor tension as above defined does not exceed 15 pounds per square inch. When the vapor tension as above defined exceeds 25 pounds per square inch, cylinders as prescribed for compressed gases (see paragraphs 1861 to 1863, inclusive) must be used.

When the condensate, blended or unblended with other products, has a vapor tension as above defined, not exceeding 10 pounds per square inch, and is shipped as "gasoline" in an ordinary tank car, 60-pound test class, defined in Master Car Builders' Association Specifications for Tank Cars, the safety valves of such a car must be set to operate at 25 pounds per

square inch, with a tolerance of one pound above or below; and the mechanical arrangements for closing the dome cover of this car must either be such as to make it practically impossible to remove the dome cover while the interior of the car is subjected to pressure or suitable vents that will be opened automatically by starting the operation of removing the dome cover must be provided. The shipper must attach securely and conspicuously to the dome and to the dome cover white placards conforming to samples furnished by the Chief Inspector of the Bureau of Explosives, cautioning all railway and refinery employees not to remove the dome cover while interior pressure exists. The presence of these dome placards must be noted on the shipping order, and on the billing accompanying the car. This regulation must be made effective not later than May 15, 1916, at all points where this condensate from natural gas or "casinghead gas" is produced and shipped in a blended or unblended state; and the requirement for construction of dome covers and valve setting at 25 pounds must be made effective not later than January 1, 1917, for all tank car shipments of inflammable liquids with flash points lower than 20 degrees F.

When the "blowing" of safety valves of a car containing inflammable liquids is noted, any available means for cooling the car shell and contents, such as spraying with water, should be utilized; and, if practicable, the car should be moved to an isolated point, to minimize the fire risk. Covering the safety valves with wet cloth, wet blankets or wet gunny sacks will decrease the danger of igniting vapors escaping from a "blowing" valve. The burning of these vapors at the safety valve is not liable to cause an explosion. The valves are designed to permit, in emergencies, the burning in this way of the entire contents of the car.

(1) Carbon bisulphide in interior packages of capacity greater than  $\frac{1}{2}$  gallon must be shipped in metal cans of not less than 28 gauge, boxed, complying with Specification No. 2; or in metal barrels or drums complying with Specification No. 3, such barrels or drums after January 1, 1916, not to exceed 55 gallons capacity. Carbon bisulphide may also be shipped in tank cars complying with paragraph 1824 (j).

1825. (a) Packages containing inflammable liquids must not be entirely filled. Sufficient interior space must be left vacant to prevent leakage or distortion of containers, due to increase of temperature during transit. In all such packages, this vacant space must not be less than 2 per cent of the total capacity of the container. In tank cars the vacant space must not be less than 2 per cent of the total capacity of the tank,

- 44 Soap Oil,
- 45 Tanners' Oil,
- 46 Tobacco Oil,
- 47 Transformer Oil,
- 48 Wool Oil, or
- 49 Oil, not otherwise indexed by name, \* \* \* In tank cars,  
C. L., weight per gallon 6.6 lbs., subject to rule 32.. 5

*Supplement No. 5.*

INTERSTATE COMMERCE COMMISSION REGULA-  
TIONS FOR THE TRANSPORTATION OF DAN-  
GEROUS ARTICLES OTHER THAN EX-  
PLOSIVES BY FREIGHT.

Prescribed under act of March 4, 1909, and section 15 of the act to regulate commerce, as amended June 18, 1910. Revision formulated and published July 2, 1914, effective October 1, 1914, and superseding regulations published January 1, 1912. Further revision formulated and published July 15, 1918, effective September 1, 1918, superseding the regulations published July 2, 1914.

GENERAL NOTICE.

1701. Special precautions are necessary in preparing for shipment packages of dangerous articles other than explosives, and in handling these packages during transit. Any failure of a shipper, or of a carrier, to perform the duties imposed upon him in this respect may be the actual or a contributory cause not only of destructive fires but of disastrous explosions, since large quantities of explosives are transported frequently through thickly populated districts and in trains containing cars loaded with other dangerous articles.

1702. Sections 235 and 236 of the act of March 4, 1909, require the shipper of dangerous articles to describe and mark his packages properly and to inform the agent of the carrier of the true character of their contents. Heavy penalties are provided for the shipper who knowingly solicits the transportation of dangerous articles without complying with these requirements, as well as for the carrier that knowingly transports them.

1703. To promote the uniform enforcement of law and to minimize the dangers to life and property incident to the transportation by land in interstate commerce of dangerous articles other than explosives, the following regulations are prescribed to define these articles for freight transportation purposes, to state the precautions that must be observed by the shipper in preparing them for shipment, and by the carrier in handling them while in transit. It is the duty of each such carrier and shipper to make the prescribed regulations effective and to thoroughly instruct their employees in relation thereto.

1704. These regulations apply to all shipments of dangerous articles other than explosives, including carriers' material and supplies.

1705. Specifications as to containers, methods of packing for shipment, etc., will be considered and prescribed from time to time. Orders prescribing such specifications will be given effective dates as conditions and investigations may appear to warrant.

1706. The Bureau for the Safe Transportation of Explosives and other Dangerous Articles, hereinafter called Bureau of Explosives, organized by the railways under the auspices of the American Railway Association, is an efficient bureau in charge of an expert chief inspector. This bureau will make inspections and conduct investigations and will confer with manufacturers and shippers with a view to determining what specifications and regulations will within reasonable limits afford the highest degree of safety in packing and preparing these dangerous articles for shipment and in transporting the same. The Commission will seek to avail itself of the expert knowledge thus developed and, in formulating amendments to these regulations or specifications supplemental thereto, while not bound thereby, will give due weight to such expert opinions.

### GENERAL RULES.

1711. Carriers that are subject to the act to regulate commerce must not receive shipments of articles defined as dangerous by these regulations when the shipments are not packed, marked, labeled, described, and certified as prescribed herein. The method of manufacture and packing of articles defined as dangerous by these regulations, so far as it affects safe transportation, must be open to inspection by a duly authorized representative of the initial carrier or of the Bureau of Explosives.

1712. All shipments of articles subject to these regulations offered for transportation in interstate commerce must be properly described by the shipper in his shipping order and bill of lading under the specific or general name provided for the description of such freight by the carrier's classification and tariff governing.

The same description of contents must be marked plainly on the outside of each package. Tank cars must bear thereon a card showing proper name of contents.

In less-than-carload shipments each package must be

marked also to show plainly the name and address of the consignee. This address, the name of contents, and the required label or "no label required" marking, should be as near together as practicable.

1713. All shipments of articles defined as dangerous by these regulations, and for which detailed instructions for packing are not given herein, must be securely packed in containers strong enough to stand without rupture or leakage of contents all ordinary shocks incident to reasonably careful handling during transit. It is the duty of shippers, where leakage from their shipping containers is known to be a probable source of fire or material damage to other freight, to exercise special care in constructing shipping containers for such articles, even though their names do not appear in the list of dangerous articles, paragraph 1807.

1714. Carriers must forward shipments of dangerous articles other than explosives promptly and within 48 hours after acceptance at originating point or receipt at transfer station, or at interchange point, and consignees must remove such shipments from the carrier's property within 48 hours after notice of arrival at destination, Sundays and holidays not included.

1715. (a) *Serious violations of these regulations*, such as the discovery of leaking or broken packages of dangerous articles, and *accidents or fires* in connection with the transportation or storage on carrier's property of dangerous articles, must be reported promptly by the carrier to the chief inspector of the Bureau of Explosives, 30 Vesey Street, New York City.

(b) Consignees should report promptly to the chief inspector, Bureau of Explosives, all instances of broken or defective containers in shipments of dangerous articles received by them.

1716. Containers that have been previously used for dangerous articles other than explosives, must have the old marks and labels removed before being used for the shipment of other articles.

## SECTION 1. INFORMATION AND DEFINITIONS.

1800. For transportation purposes dangerous articles other than explosives are divided into the following groups:

1. *Forbidden articles.*
2. *Acceptable articles.*

**GROUP 1.—FORBIDDEN ARTICLES.**

1801. The following are *forbidden articles*:

(a) Outside packages containing in the same compartment interior packages, the mixture of whose contents would be liable to cause a dangerous evolution of heat, gas, or corrosive materials.

(b) Cylinders containing gases capable of combining chemically.

(c) Packages containing dangerous articles in a leaking condition or in such an insecure condition as to make leakage probable during transit.

(d) Rags or cotton waste oily with more than 5 per cent of vegetable or animal oil, or wet rags, or wet textile waste, or wet paper stock.

(e) Charcoal screenings from wet charcoal, or wet screenings, or screenings that have been wet. (See par. 1833 (c).)

(f) Dangerous articles not properly packed, marked, labeled, described, and certified.

(g) Iron sponge that has not been properly oxidized during manufacture; and spent oxide or spent iron mass except when loaded in open steel cars.

**GROUP 2—ACCEPTABLE ARTICLES.****Definitions.***Inflammable Liquids—Red Label*

1802. This group includes any liquid or liquid mixture that gives off inflammable vapors (as determined by flash point from Tagliabue's open-cup tester, as used for test of burning oils) at or below a temperature of 80° F.

*Inflammable Solids—Yellow Label*

1803. This group includes all substances other than those classified as explosives that are liable under conditions incident to transportation to cause fires by self-ignition through friction, through absorption of moisture, or through spontaneous chemical changes.

*Oxidizing Materials—Yellow Label*

1804. This group includes all substances, such as chlorates, permanganates, peroxides, and nitrates, that yield oxygen readily to stimulate the combustion of organic matter.

*Corrosive Liquids—White Label*

1805. This group includes the strong mineral acids (in strength greater than one-half <sup>1</sup> concentrated, i. e., 47 per cent sulphuric, 34 per cent nitric, 20 per cent hydrochloric) and other strongly corrosive liquids that are liable to cause fires when mixed with chemicals or with organic matter, or are liable in case of leakage from their shipping containers, to damage other freight materially.

*Compressed Gases—Red or Green (Gas) Label*

1806. This group includes all inflammable or noninflammable gases assembled for shipment under pressure exceeding 25 pounds per square inch, except when such gases are in cylinders or tubes not exceeding seven-eighths inch outside diameter and of not more than 4 fluid ounces water capacity.

## LIST OF PRINCIPAL DANGEROUS ARTICLES.

1807. (a) The following list shows the names of well-known articles in general use, other than explosives, that are dangerous; the kind of label required on outside packages; the quantities that may be shipped in one outside package without a label when certified and marked "No label required," and the label exemptions on account of specified packing. (See column 5 of list.)

(b) When a shipment described under a name not in the following list is defined as a dangerous one by paragraphs 1802 to 1806, inclusive, the shipper must inform the carrier of the fact by use of the proper label prescribed herein, and the shipping order must show the certificate prescribed by paragraph 1867. The maximum quantity of any such article shipped in one outside package without label, when certified and marked, "No label required," except as specified herein, must not exceed the limit prescribed by column 3 of the list for dangerous articles of similar flash point or characteristics.

(c) Inflammable liquids as defined by paragraph 1802, in securely closed glass, earthenware, or metal containers of not exceeding 1 pint capacity each (ether 1 1/10 pounds), when flash point is 20° F., or lower, and of not exceeding one quart capacity when flash point is above 20° F., packed and cushioned in fiber board or corrugated strawboard containers, wooden boxes, kegs, or barrels, complying with shipping con-

---

NOTE—Hand fire extinguishers containing non-liquefied gas for the purpose of expelling fire-extinguishing contents are excepted.

---

(1) For express transportation, greater than one-fourth concentrated.

tainer specifications that apply, may be shipped without labels when certified and marked "No label required."

(d) A shipment described under a definite and proper name not in the following list and on a shipping order with no notation as to labels applied and no shipper's certificate, will be assumed by the carrier in the absence of knowledge to the contrary, to be not dangerous under these regulations.

(e) When articles described under names in the following list marked with (\*) are not dangerous under the regulations, the shipper must, unless otherwise provided in said list, state on his shipping order, as a part of the description of such article, for less than carloads, "No label required," and for carloads, state on his shipping order "No placard required," and must also furnish the certificate prescribed by paragraph 1867 and mark the packages "No label required."

(f) When several dangerous articles are placed in one outside package without violating these regulations, labels must be applied, when the combined quantity of the articles of any one group exceeds the lowest limit prescribed by column 3 for any of the articles of that group that are included.

(g) When dangerous articles requiring the red label are shipped in the same outside package with dangerous articles requiring yellow or white labels, the outside package must be labeled with red label only.

## LIST OF PRINCIPAL DANGEROUS ARTICLES.

## SECTION 2

## RULES FOR PACKING.

1821. Dangerous articles for which the yellow and white labels, respectively, are prescribed must not be packed in the same package, unless the bottle containing the corrosive liquid is cushioned by incombustible absorbent material in tightly closed metal containers, as prescribed by paragraph 1851. Cylinders of compressed gases must not be packed with other articles.

1822. (a) Barrels, drums, cylinders, boxes, cans, carboys, and other containers used hereafter for the shipment of dangerous articles other than explosives, must be made in accordance with approved specifications that apply and must be properly marked to show compliance with those specifications.

Such containers manufactured and used hereafter must be made in accordance with the specifications that apply as prescribed herein.

Such containers manufactured before the effective date of the specifications prescribed herein may be used if they were made in accordance with specifications previously approved.

Provided, that cylinders manufactured previous to the date on which specifications therefor were first made effective may be used if they comply with the requirements of paragraph 1861 of these regulations. Provided further, that carboys and metal barrels or drums manufactured and purchased prior to the date on which specifications were first made effective, may be used if they are in good condition and afford a package as secure as packages constructed under corresponding specifications.

(b) In addition to standing the tests prescribed, the design and construction of packages must be such as to prevent the occurrence in individual packages of defects that permit leakage of their contents under the ordinary conditions incident to transportation. The results of experience, gained by an examination of damaged or broken packages on arrival at destination, must be reported to and recorded by the Bureau of Explosives, to the end that further use of any particular kind of package shown by experience to be inefficient may be prohibited by the Commission.

(c) Pending approval and promulgation by the Commission of specifications for types of shipping containers other than those for which specifications are published herein, con-

tainers may be used which after investigation made by the Bureau of Explosives, or by other competent testing laboratory in the presence of a representative of the Bureau of Explosives, are shown to possess the general efficiency and the protection against leakage of contents afforded by the standard types of corresponding capacity described in the specifications published herein, provided they are labeled or marked to show compliance with this requirement.

(d) Tank cars used for the shipment of dangerous articles other than explosives must comply with Master Car Builders' specifications, and a tank car that leaks or one that has any defect which would make leakage during transit probable or that has not been tested and stenciled in compliance with Master Car Builders' specifications must not be used for the shipment of any inflammable liquid.

(e) The tanks and their fittings must be examined by the shipper to see that they are in proper condition for loading. Tanks must be examined for evidence of previous leaks; safety and outlet valves, dome covers, and outlet-valve caps must be in proper condition before loading; tanks must be loaded with outlet valve caps off; after loading, tanks must not show any dropping of liquid contents at the seams or rivets, and should such dropping appear cars must be properly repaired by calking; outlet valves must not permit more than a dropping of the liquid with valve caps off, otherwise valve must be reground and repaired. Dome covers and valve caps provided with suitable gaskets must be properly screwed in place before cars are tendered to the carrier.

(f) Loaded tank cars tendered for shipment must be inspected by the carrier to see that they are not leaking; that the air and hand brakes, journal boxes, trucks, and safety appliances are in proper condition for service; and that the car has been tested within limits prescribed by Master Car Builders' specifications.

(g) Tests of all tank cars and their safety valves, as made in compliance with Master Car Builders' specifications, must be certified by the party making the tests to the owner of the tank car and to the chief inspector, Bureau of Explosives, and this certification must show the initials and number of the tank car, the service for which it is suitable, the date of test, place of test, and by whom made.

#### *Inflammable Liquids—Red Label*

1824. (a) All inflammable liquids must be shipped in packages complying with specifications that apply, as follows:

(b) In tightly closed metal cans of not exceeding 10 gal-

lons capacity, packed in wooden boxes complying with Specification No. 2 or cushioned in wooden barrels or kegs complying with Specification No. 11.

(c) In well-stoppered glass or earthenware vessels of not exceeding 1 gallon capacity, cushioned in wooden boxes complying with Specification No. 2 or cushioned in wooden barrels or kegs complying with Specification No. 11, or in a well-stoppered glass or earthenware vessel of not exceeding 5 gallons capacity, well cushioned in a wooden box and not more than one such vessel in the box. The completed package must comply with swing and drop tests prescribed for boxed carboys by Specification No. 1.

(d) In well-stoppered glass, earthenware, or metal vessels of not exceeding 1 pint capacity when flash point is 20° F., or lower, and 1 quart capacity when flash point is above 20° F., cushioned in fiber board or corrugated strawboard containers complying with Specification No. 24.

(e) In wooden kits of not exceeding 10 gallons capacity, packed in wooden boxes complying with Specification No. 2, or cushioned in wooden barrels or kegs complying with Specification No. 11.

(f) In metal-jacketed cans of not exceeding 10 gallons capacity, complying with Specification No. 23.

(g) In well-stoppered carboys of not exceeding 13 gallons capacity, cushioned in wooden boxes complying with Specification No. 1.

(h) In wooden barrels or kegs complying with Specification No. 10 when the flash point of the liquid is not lower than 20° F., or in wooden barrels or kegs complying with Specification No. 9 when the flash point is lower than 20° F., unless otherwise provided in the tariffs under which shipment moves.

(i) In metal barrels or drums complying with Specification No. 5.

(j) In tank cars complying with Master Car Builders' specifications provided the vapor tension of the inflammable liquid corresponding to a temperature of 100° F. does not exceed 10 pounds per square inch. A tank car must not be used for shipping inflammable liquids with flash point lower than 20° F., unless it has been tested with cold-water pressure of 60 pounds per square inch and stenciled as required by Master Car Builders' specifications, and is equipped with safety valves set to operate at 25 pounds per square inch, and with mechanical arrangement for closing dome cover as specified in paragraph 1824 (k).

(k) Liquid condensates from natural gas or from casing head gas of oil wells, made either by the compression or absorption process, alone or blended with other petroleum products, must be described as Liquefied Petroleum Gas when the vapor pressure<sup>1</sup> at 100° F. (90° F. November 1 to March 1) exceeds 10 pounds per square inch.

When the liquid condensate, alone or blended with other petroleum products, has a vapor pressure not exceeding 10 pounds per square inch, it must be described and shipped as Gasoline, Casing head Gasoline, or Casing head Naphtha.

Liquefied petroleum gas of vapor pressure exceeding 10 pounds per square inch and not exceeding 15 pounds per square inch, from April 1 to October 1 and 20 pounds per square inch from October 1 to April 1, must be shipped in metal drums or barrels which comply with Shipping Container Specification No. 5; or in special insulated tank cars approved for this service by the Master Car Builders' Association.

Liquefied petroleum gas of vapor pressure exceeding 15 or 20 pounds per square inch as provided herein, and not exceeding 25 pounds per square inch, must be shipped only in metal drums or barrels which comply with Shipping Container Specification No. 5.

Liquefied petroleum gas of vapor pressure exceeding 25 pounds per square inch must be shipped in cylinders as prescribed for compressed gases (see pars. 1861 to 1863, inclusive).

When the liquid condensate, alone or blended with other petroleum products, has a vapor pressure not exceeding 10 pounds per square inch it must be described as Gasoline or Casing-head Gasoline or Casing-head Naphtha and must be shipped in metal drums or barrels complying with Specification No. 5; or in ordinary tank cars, 60 pounds test class equipped with mechanical arrangement for closing of dome covers as specified in Master Car Builders' specifications for tank cars.

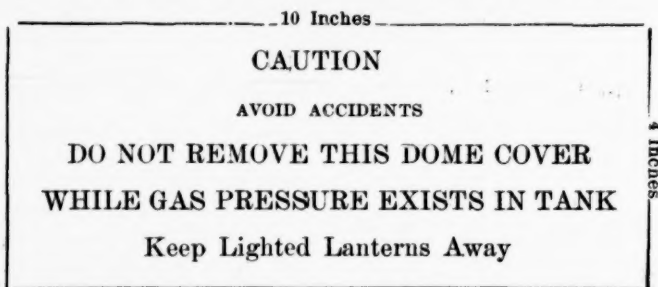

Every tank car containing liquid condensates, either blended or unblended, including liquefied petroleum gas, as defined herein, must have safety valves set to operate at 25 pounds per square inch with a tolerance of 3 pounds above or below, and the mechanical arrangements for closing the dome covers of such cars must either be such as to make it practically impossible to remove the dome cover while the interior

---

(1) In measuring the vapor pressure the container may be vented momentarily at a temperature of 70° F.

of the car is subjected to pressure; or suitable vents that will be opened automatically by starting the operation of removing the dome cover must be provided:

The shipper must attach securely and conspicuously to the dome and dome cover three special white dome placards measuring 4x10 inches, bearing the following wording:

One placard must be attached to each side of the dome and one placard must be attached to the dome cover. The presence of these special dome placards must be noted on the shipping order by the shipper and by the carrier on the billing accompanying the car. Placards must conform to samples furnished by the Chief Inspector of the Bureau of Explosives.

(1) Carbon bisulphide in interior packages of capacity greater than one-half gallon must be shipped in metal cans of not less than 28 gauge, boxed, complying with Specification No. 2; or in metal barrels or drums complying with Specification No. 5, such barrels or drums not to exceed 55 gallons capacity. Carbon bisulphide may also be shipped in tank cars complying with paragraph 1824 (j).

1825. (a) Packages containing inflammable liquids must not be entirely filled. Sufficient interior space must be left vacant to prevent leakage or distortion of containers, due to increase of temperature during transit. In all such packages this vacant space must not be less than 2 per cent of the total capacity of the container. In tank cars the vacant space must not be less than 2 per cent<sup>1</sup> of the total capacity of the tank, i. e., the shell and dome capacity, combined. If the dome of tank cars does not provide this 2 per cent, sufficient vacant space must be left in the shell of the tank to make up the difference.

(b) In packages containing alcohol, cologne spirits, high wines, or other distilled spirits of 150 proof or over the vacant interior space or allowance for wantage or ullage must be the

maximum permitted by the United States Internal Revenue Regulations.

1826. Interior packages containing 1 quart or more of an inflammable liquid must be packed with their filling holes up and the top of the outside package must be plainly marked "THIS SIDE UP."

1827. Wooden-jacketed cans and wooden kits must not be used for the shipment of inflammable liquids, except as inside containers as provided by Specification No. 2 or 11.

(1) An outage of 2 per cent is frequently insufficient for light petroleum products, owing to the fact that they expand more than heavier petroleum products when the temperature increases, and this rate of expansion varies with the specific gravity of the material. It is recommended that when tank cars are loaded with gasoline, casing-head gasoline or casing-head naphtha (see Par. 1824 (k)) the outage in tank shall not be less than the following:

Temperature of product when loaded.	Minimum outage required when gravity is—		
	50-60° B. Per cent.	60-70° B. Per cent.	70-80° B. Per cent.
0- 60° F.....	3.2	3.5	4.1
61- 70° F.....	2.5	2.8	3.3
71- 80° F.....	2.0	2.1	2.4
81-100° F.....	2.0	2.0	2.0

### Government's Exhibit 45.

Only three supplements to this Classification will be in effect at any time.

P. S. C.-Mo. No. 39, of F. A. Leland, Agent (Cancels P. S. C.-Mo. No. 14) C. R. C. No. 492 of Eugene Morris, Agent (Cancels C. R. C. No. 386) Ohio No. 537 of Eugene Morris, Agent (Cancels R. C. O. No. 372). *I. C. C. No. 1137.* Cancels I. C. C. No. 1026 F. A. Leland, Agent. I. C. C. No. 588 Cancels I. C. C. No. 442 Eugene Morris, Agent.

### SOUTHWESTERN LINES' CLASSIFICATION EXCEPTIONS AND RULES--CIRCULAR NO. 1-G

(Cancels Southwestern Lines' Classifications Exceptions and Rules-Circular No. 1-F)

(For Individual Lines' Tariff Numbers, Current and Canceled, See Page 2 and 3)

Containing Exceptions to Western Classification No. 53 (R. S. Fyfe's I. C. C. No. 11, P. S. C.-Mo. No. 2) or re-issues

thereof) and Rules and Conditions governing traffic originating at or destined to points in Louisiana and Texas, also Texarkana, Ark.-Tex., (see item No. 18, or re-issues thereof) and moving under tariffs which are specifically made subject hereto.

Note.—Whenever a carload or a less-than-carload commodity rate is established, it removes the application of the class rate to or from the same points on that commodity in carload quantities or less-than-carload quantities (as the case may be), except when and in so far as alternative use of class and commodity rates is specifically provided for by including in different sections of one and the same tariff such class and commodity rates, and by including in each section of such tariff the specific rule: "If the rates in section — of this tariff make a lower charge on any shipment than the rates in section — of this tariff, the rates in section — will be applied."

The ratings named in this Classification are subject to the conditions of the carriers' bills of lading, and (unless otherwise provided to the contrary) to the rules, conditions and requirements of Western Classification No. 53 (R. C. Fyfe's I. C. C. No. 11, P. S. C.-Mo. No. 2), or re-issue thereof.

This Classification, contains rates that are higher for shorter distances than for longer distances over the same route, such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Orders, as indicated in individual items herein.

Exception: Will not apply on traffic moving wholly within the State of Missouri.

Issued May 2, 1916. *Effective June 15, 1916* (except as noted in Items Nos. 91 and 92).

Issued by Eugene Morris, Agent, Chicago, Ill.; F. A. Leland, Agent, St. Louis, Mo.

Authority No. 24017.

(Stamped:) Received; Interstate Commerce Commission; 28536; May 3 1916; Division of Tariffs. Cancelled by I. C. C. No. 1244; Effective 10-19-1918.

Minimum weights on commodities in tank cars.	298-B cancels 298-A	(1) The weights and charges on shipments in tank cars (***) shall be based on the full shell capacity of the tank (as shown in United States and Canadian Railroads' Circular No. 6-K. E. B. Boyd's I. C. C. No. A-722, * * * or re-issues), at actual or estimated weights provided in current Western Classification—except as provided in Sections (2) * * * unless the weight carrying capacity of the car trucks is less, in which case the actual weight, subject to the weight carrying capacity of the car trucks will govern as a minimum.
Reissue; effective February 3, 1917, in Supplement No. 9.		(2) When shipments of inflammable liquids subject to Section 1325, Rule 44 of current Western Classification, are loaded in tank cars, the domes of which are not of sufficient capacity to cover the two (2) per cent outage as required, an allowance will be made from the shell capacity of tank, to cover the difference between the dome capacity and the two (2) per cent outage. Shippers must show on bills of lading or shipping receipt both the shell and dome capacity of car.

*Supplement No. 16.*

To P. S. C.—Mo. No. 39 of F. A. Leland, Agent; C. R. C. No. 492 of Eugene Morris, Agent; Ohio No. 537 of Eugene Morris, Agent; I. C. C. No. 1137 of F. A. Leland, Agent; I. C. C. No. 588 of Eugene Morris, Agent.

(Cancels Supplement No. 12.) Supplements Nos. 15 and 16 contain all changes from the original Classification that are effective June 8, 1917. Supplement No. 11 suspends portions of Supplement No. 4. Supplement No. 14 suspends Supplement No. 13.

**SOUTHWESTERN LINES' CLASSIFICATION  
EXCEPTIONS AND RULES--CIRCULAR NO. 1-G**

(See page 2 for individual lines' tariff numbers)

Containing Exceptions to Western Classification No. 54 (R. C. Fyfe's I. C. C. No. 12, P. S. C.-Mo. No. 3), or re-issues thereof, and Rules and Conditions governing traffic originating at or destined to points in Louisiana and Texas, also Texarkana, Ark.-Tex. (see item No. 18, or re-issues), and moving under tariffs which are specifically made subject hereto.

Note.—Whenever a carload or a less-than-carload commodity rate is established, it removes the application of the class rate to or from the same points on that commodity in carload quantities or less-than-carload quantities (as the case may be), except when and in so far as alternative use of class and commodity rates is specifically provided for by including in different sections of one and the same tariff such class and commodity rates, and by including in each section of such tariff the specific rule: "If the rates in section — of this tariff make a lower charge on any shipment than the rates in section — of this tariff, the rates in section — will be applied."

The ratings named in this Classification are subject to the conditions of the carriers' bills of lading, and (unless otherwise provided to the contrary) to the rules, conditions and requirements of Western Classification No. 54 (R. C. Fyfe's I. C. C. No. 12, P. S. C.-Mo. No. 3), or re-issues thereof.

This Classification, contains rates that are higher for shorter distances than for longer distances over the same route, such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Orders, as indicated in individual items herein.

Exception: Will not apply on traffic moving wholly within the State of Missouri.

Issued April 21, 1917. *Effective May 31, 1917* (except as noted on pages 3, 4 and 5 where reference is made to (119); in items 377-F, 949-D; and in other individual items).

Issued by Eugene Morris, Agent, Chicago, Ill.; F. A. Leland, Agent, St. Louis, Mo.

Authority No. 25196.

(Stamped:) Received; Interstate Commerce Commission; 24868; Apr 21 1917; Division of Tariffs.

Only three Supplements to this Tariff will be in effect at any time.

I. C. C. No. 999. Cancels I. C. C. No. 889.

SOUTHWESTERN LINES TARIFF NO. 26-S

Cancels Southwestern Lines Tariff No. 26-R. For Individual Lines' Tariff Numbers, Current and Cancelled, see page 4.

Local, joint and proportional tariff, applying on classes and commodities between points in Oklahoma, named on pages 73 to 79, inclusive, and points in Texas, also Texarkana, Tex.-Ark., named on pages 44 to 62, inclusive.

Governed, except as otherwise provided herein, by WESTERN CLASSIFICATION No. 51 (F. J. Hoffman's I. C. C. No. 9) or reissues thereof; and SOUTHWESTERN LINES' CLASSIFICATION EXCEPTIONS AND RULES CIRCULAR No. 1-E (F. A. Leland's I. C. C. No. 931), or reissues thereof.

Special Notice.—The rates named in this Tariff are subject to the conditions of the Carriers' Bills of Lading, and apply from all points specified to all points specified via all lines parties, unless specifically provided to the contrary in Items 78 to 1380, inclusive, or reissues, or in other individual items.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates throughout this Tariff that are made subject to Items Nos. 48, 54, 60 and 66, or reissues thereof, are not made applicable from and to all intermediate points. Upon reasonable request therefor rates which will not exceed those published in such items from or to (as the case may be) the next more distant station will (under authority granted by the Interstate Commerce Commission) be established in the manner therein indicated by the carriers parties to this Tariff, upon one day's notice to the Commission and the public.

This Tariff contains rates that are higher for shorter than for longer distances over the same route, such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by Authority of Interstate Commerce Commission Order F. S. No. 108 of July 12, 1911, F. S. No. 317 of October 10, 1911, Order F. S. No. 417 of December 12, 1911, Order F. S. No. 859 of March 16, 1912, and F. S. O. No. 1258 of June 1, 1912.

Issued June 20, 1913. *Effective August 1, 1913* (C. F. 23608) (C. F. 34901) except as noted on pages 51 and 66 where reference is made to (18); and in item 1656.

In view of the relinquishment of groups and the establishment of group rates in lieu of rates at individual points and other extraordinary conditions which obtain in this instance, changes in rates are not indicated in this tariff under special permission of the Interstate Commerce Commission No. 24971 of June 19, 1913.

Issued by F. A. Leland, Agent, St. Louis, Mo.

Authority No. 20350.

(Stamped:) Received; Interstate Commerce Commission; 39946; Jun 28 1913; Division of Tariffs. Cancelled by I. C. C. No. 1048; Effective July 24, 1914.

LAR No. 1-F (F. A. Leland's I. C. C. No. 1026), or reissues thereof.

Special Notice.—The rates named in this Tariff are subject to the conditions of the Carriers' Bills of Lading, and apply from all points specified to all points specified via all lines parties, unless specifically provided to the contrary in Items 78 to 1380, inclusive, or reissues, or in other individual items.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates throughout this Tariff that are made subject to Items Nos. 48, 54, 60 and 66, or reissues thereof, are not made applicable from and to all intermediate points. Upon reasonable request therefor rates which will not exceed those published in such items from or to (as the case may be) the next more distant station will (under authority granted by the Interstate Commerce Commission) be established in the manner therein indicated by the carriers parties to this Tariff, upon one day's notice to the Commission and the public.

This Tariff contains rates that are higher for shorter than for longer distances over the same route, such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by Authority of Interstate Commerce Commission Order F. S. No. 108 of July 12, 1911, F. S. No. 317 of October 10, 1911, Order F. S. No. 417 of December 12, 1911, Order F. S. No. 859 of March 16, 1912, F. S. No. 1258 of June 1, 1912, and F. S. No. 3033, of July 22, 1913.

Issued April 11th, 1914. *Effective May 20th, 1914*; except as noted on page 23 where reference is made to (44); on page 26 where reference is made to (45); and in individual items.

Issued by F. A. Leland, Agent, St. Louis, Mo.

Authority No. 21377.

(Stamped:) Received; Interstate Commerce Commission; 28556; Apr 14 1914; Division of Tariffs.

## SOUTHWESTERN LINES TARIFF NO. 79-B

Cancels Southwestern Lines' Tariff No. 79-A. For Individual Lines Tariff Numbers, current and cancelled, see page 3.

Local, joint and proportional tariff, applying on petroleum and petroleum products, asphalt, asphalt rock, asphalt tar, asphaltum, axle grease and petroleum liquid asphalt carloads (see page 9) from Oklahoma producing points and Ft. Smith, Ark. (shown on pages 11 to 14, inclusive), to interstate points (see pages 15 to 18, inclusive).

Governed, except as otherwise provided herein, by Western Classification No. 55 (R. C. Fyfe's *I. C. C. No. 13*), or reissues thereof.

The rates named in this tariff are subject to the conditions of the Carrier's bill of lading.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates in this Tariff are not made applicable FROM all intermediate points. Upon reasonable request therefor, rates which will not exceed those in effect, and specifically published in this Tariff from the next more distant point on the same railroad, will, under authority granted by the Interstate Commerce Commission, be established by the

carriers parties to this Tariff from any intermediate point, upon one day's notice to the Commission and to the public.

This Tariff contains rates that are higher for shorter distances than for longer distances over the same route. Such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Orders, as indicated in individual items herein, and F. S. O. No. 7316 of May 27, 1918.

Issued November 20, 1918. *Effective December 31, 1918*; except as noted on page 5, where reference is made to note A, and on pages 11, 12, 13, 14, 21, 34 and 80, where reference is made to character (17).

Increases resulting from application of rule governing disposition of fractions contained in this schedule are filed under authority of the Interstate Commerce Commission's Fifteenth Section Order No. 909 of October 24, 1918, without formal hearing, which approval shall not affect any subsequent proceeding relative thereto.

Changes which result from additions of or abandonment of stations and station facilities contained in this Tariff are filed under authority of the Interstate Commerce Commission's Fifteenth Section Order No. 250 of January 8, 1918, without formal hearing, which approval shall not affect any subsequent proceeding relative thereto.

Issued by F. A. Leland, Agent, St. Louis, Mo.

Authority No. 26185. C. F. 4390.

(Stamped:) Received; Interstate Commerce Commission; 62606; Nov 23 1918; Division of Tariffs. Cancelled by I. C. C. No. 1338; Effective Dec 21 1919.

## RULES AND CONDITIONS.

SUBJECT	ITEM NO.	RULES
Minimum Weights on Commodities in Tank Cars.	90	<p>1. The weights and charges on shipments in tank cars, shall be based on the full shell capacity of the tank (as shown in United States and Canadian Railroads' Circular No. 6-N, E. B. Boyd's I. C. C. No. A-906, or re-issues), at actual or estimated weights provided in current Western Classification—except as provided in Sections 2, 3 and 4—unless the weight carrying capacity of the car trucks is less, in which case the actual weight, subject to the weight carrying capacity of the car trucks will govern as a minimum.</p> <p>2. When shipments of Inflammable Liquids, subject to Section 1825, Rule 44 of current Western Classification, are loaded in tank cars, the domes of which are not of sufficient capacity to cover the two (2) per cent outage as required, an allowance will be made from the shell capacity of tank, to cover the difference between the dome capacity and the two (2) per cent outage. Shippers must show on bills of lading or shipping receipt both the shell and dome capacity of car.</p>

Supplement No. 10 to I. C. C. No. 1219. *Supplement No. 5 to I. C. C. 1253.* Supplement No. 1 contains all changes from the original tariff that are effective on the date hereof.

UNITED STATES RAILROAD ADMINISTRATION,

W. G. McAdoo, Director General of Railroads

SOUTHWESTERN LINES TARIFF NO. 79-B

*Supplement No. 10.*

SOUTHWESTERN LINES TARIFF NO. 79-A

For Individual Lines' Tariff Numbers, see page 2.

*Supplement No. 1.*

Supplement No. 1 contains all changes from the original tariff that are effective on the date hereof.

Local, joint and proportional tariff, applying on petroleum and petroleum products, asphalt, asphalt rock, asphalt tar, asphaltum, axle grease and petroleum liquid asphalt carloads (see page 9 of tariff) from Oklahoma producing points and Ft. Smith, Ark. (shown on pages 11 to 14, inclusive, of tariff, as amended) to interstate points (see pages 15 to 18, inclusive, of tariff, as amended).

Governed, except as otherwise provided herein, by Western Classification No. 55 (R. C. Fyfe's I. C. C. No. 13), or reissues thereof.

The rates named in this tariff are subject to the conditions of the Carrier's bill of lading.

By authority of Rule 77 of Interstate Commerce Commission Tariff Circular No. 18-A, rates in this Tariff are not made applicable FROM all intermediate points. Upon reasonable request therefor, rates which will not exceed those in effect, and specifically published in this Tariff from the next more distant point on the same railroad, will, under authority granted by the Interstate Commerce Commission, be established by the carriers parties to this Tariff from any intermediate point, upon one day's notice to the Commission and to the public.

This Tariff contains rates that are higher for shorter distances than for longer distances over the same route. Such departure from the terms of the Amended Fourth Section of the Act to Regulate Commerce is permitted by authority of Interstate Commerce Commission Fourth Section Orders, as indicated in individual items herein, and F. S. O. No. 7316 of May 27, 1918.

Issued December 16, 1918. *Effective January 31, 1919*; except as noted on pages 2, 3, 4 and 5, and in other individual items).

Changes which result from additions of or abandonment of stations and station facilities contained in this Tariff are filed under authority of the Interstate Commerce Commission's Fifteenth Section Order No. 250 of January 8, 1918, without formal hearing, which approval shall not affect any subsequent proceeding relative thereto.

Issued by F. A. Leland, Agent, St. Louis, Mo. (Appointment Notice No. 2.)

Authority No. 26214.

Regulations Issued by the Interstate Commerce Commission,  
Under Authority of Section 6 of the Act to Regulate  
Commerce as Amended June 18, 1910, to Govern the Con-  
struction and Filing of Freight Tariffs and Classifica-  
tions, and Passenger Fare Schedules, by Common Car-  
riers Wholly by Railroad or Partly by Railroad and  
Partly by Water, as Defined in Said Act.

Approved February 13, 1911. Effective March 31, 1911  
(except as noted in individual items).

### Freight Tariffs and Classifications.

The term "joint rate," as used herein, is construed to  
mean a rate that extends over the lines of two or more car-  
riers and that is made by agreement between such carriers.

"Joint tariffs" are those which contain or are made up  
from such "joint rates."

*Page 19.*

(i) In case of change of ownership or control of a car-  
rier, the carrier whose line is absorbed, taken over, or pur-  
chased by another carrier shall unite with that other carrier  
in common supplements to the tariffs on file with the Commis-  
sion, on the one hand withdrawing and on the other hand  
accepting and establishing such tariffs and all effective (20)  
supplements thereto. Such common supplements shall be ex-  
ecuted jointly by the traffic officers of both the old and the new  
carriers, shall be numbered consecutively as supplements to  
the tariff (even if of less than five pages) to which they are  
directed, and may be made effective on five days' notice to  
the public and the Commission by noting thereon reference  
to this rule. Such common supplements will not be counted  
against the number of supplements permitted to such tariff  
under paragraph (c) of Rule 9. Amendments to such tariffs  
must thereafter be filed in consecutively numbered supple-  
ments thereto until the tariffs are reissued. New tariffs re-  
issuing or superseding these shall be numbered in the I. C. C.  
series of the new carrier.

When a road or a part of a road is transferred from the operating control of one company to that of another, or when its name is changed, the existing tariffs issued by the company that surrenders control must be withdrawn by it and adopted by the company assuming control, as provided in the preceding paragraph.

(j) As to tariffs issued by other carriers or joint agents under concurrences or powers of attorney granted by the old carrier or company, the new carrier or company shall, if it intends to use such tariff publications and rates, issue, file, and post, with I. C. C. number, an adoption notice, substantially as follows:

The (name of carrier) hereby adopts, ratifies, and makes its own, in every respect as if the same had been originally filed and posted by it, all tariffs, rules, notices, concurrences, traffic agreements, divisions, authorities, powers of attorney, or other instruments whatsoever, filed with the Interstate Commerce Commission by the (name of old carrier) prior to (date) the beginning of its possession. By this tariff it also adopts and ratifies all supplements or amendments to any of the above tariffs, etc., which it has heretofore filed with said Commission.

This notice may be made effective and be filed on immediate notice.

Similar adoption notice must be filed by a receiver when assuming possession and control of a carrier's lines.

Concurrences and powers of attorney so adopted by a carrier must, as soon as possible, be replaced and superseded by new concurrences and powers of attorney issued by and in the name of the new carrier or company, and in each instance canceling the concurrence or power of attorney superseded.

(21) The carrier surrendering control of the property has no lawful right to abandon its tariff except on lawful notice, and when it surrenders control of the property it surrenders all right to publish rates applicable thereto except under proper authority from the carrier or company to whose control the property passes. The public has a right to available and lawfully applicable rates over that property.

*Supplement No. 3 to Tariff Circular No. 18-A. Cancels Supplement No. 2, and includes all changes to date hereof.*

## Interstate Commerce Commission

Supplement to Regulations to Govern the Construction and  
Filing of Freight Tariffs and Classifications and  
Passenger Fare Schedules.

## Administrative Rulings.

Issued by Order of Commission, February 4, 1913.  
Washington, 1913.

.....  
*Page 3.*  
.....

Paragraph (i) of Rule 9, Tariff Circular 18-A, is amended so that it will read as follows: (Adopted February 4, 1913.)

(i) In case of change of ownership or control of a carrier, or when a road or a part of a road is transferred from the operating control of one company to that of another, or when its name is changed, the carrier which will thereafter operate the road, if it intends to use the tariff publications and rates of the former operating company, shall issue, file, and post, with I. C. C. number, an adoption notice substantially as follows:

The (name of carrier) hereby adopts, ratifies, and makes its own, in every respect as if the same had been originally filed and posted by it, all tariffs, rules, notices, concurrences, traffic agreements, divisions, authorities, powers of attorney, or other instruments whatsoever, filed with the Interstate Commerce Commission by the (name of old carrier) prior to (date) the beginning of its possession. By this tariff it also adopts and ratifies all supplements or amendments to any of the above tariffs, etc., which have been heretofore filed with said Commission.

(4) This notice may be made effective and be filed on immediate notice.

Similar adoption notice must be filed by a receiver when assuming possession and control of a carrier's lines.

Concurrences and powers of attorney so adopted by a carrier must, as soon as possible, be replaced and superseded by new concurrences and powers of attorney issued by and in the name of the new carrier or company, and in each instance canceling the concurrence or power of attorney superseded.

Paragraph (j) of Rule 9, Tariff Circular 18-A, is amended so that it will read as follows: (Adopted February 4, 1913.)

(j) A carrier whose line is absorbed, taken over, or purchased by another carrier shall unite with that other carrier

in the publication and filing of common supplements to the tariffs on file with the Commission, on the one hand withdrawing, and on the other hand accepting and establishing such tariffs and all effective supplements thereto. Such common supplements shall be executed jointly by the traffic officers of both the old and new carriers, shall be numbered consecutively as supplements to the tariffs (even if of less than five pages) to which they are directed, and may be made effective on *immediate* notice to the public and the Commission by noting thereon reference to this Rule. Such common supplements will not be counted against the number of supplements permitted to such tariff under paragraph (e) of Rule 9. Amendments to such tariffs must thereafter be filed in consecutively numbered supplements thereto until the tariffs are reissued. New tariffs reissuing or superseding these shall be numbered in the I. C. C. series of the new carrier.

The carrier surrendering control of the property has no lawful right to abandon its tariffs except on lawful notice, and when it surrenders control of the property it surrenders all right to publish rates applicable thereto except under proper authority from the carrier or company to whose control the property passes. The public has a right to available and lawfully applicable rates over that property.

#### Government's Exhibit 61.

INTERSTATE COMMERCE COMMISSION  
Washington, D. C.

#### REGULATIONS FOR THE TRANSPORTATION OF EXPLOSIVES AND OTHER DANGEROUS ARTICLES BY FREIGHT AND EXPRESS AND SPECIFICATIONS FOR SHIPPING CONTAINERS.

Prescribed Under the Act of March 4, 1909, and Section 15 of the Act to Regulate Commerce as Amended June 18, 1910.

EFFECTIVE OCTOBER 1, 1914—Except as Noted Herein.

Paragraphs are numbered to correspond to the rules and regulations of the American Railway Association.

(Seal: Interstate Commerce Commission—1887.)

Washington, Government Printing Office, 1914.

THE INTERSTATE COMMERCE COMMISSION: James S. Harlan, of Illinois; Judson C. Clements, of Georgia; Edgar E.

Clark, of Iowa; Charles C. McChord, of Kentucky; Balthasar H. Meyer, of Wisconsin; Henry C. Hall, of Colorado; Winthrop M. Daniels, of New Jersey.

REGULATIONS FOR THE TRANSPORTATION OF  
DANGEROUS ARTICLES OTHER THAN EX-  
PLOSIVES BY FREIGHT.

Prescribed under act of March 4, 1909, and section 15 of the act to regulate commerce, as amended June 18, 1910. Revisior formulated and published July 2, 1914, effective October 1, 1914, and superseding regulations published January 2, 1912.

GENERAL NOTICE.

1701. Special precautions are necessary in preparing for shipment packages of dangerous articles other than explosives, and in handling these packages during transit. Any failure of a shipper, or of a carrier, to perform the duties imposed upon him in this respect may be the actual or a contributory cause not only of destructive fires but of disastrous explosions, since large quantities of explosives are transported frequently through thickly populated districts and in trains containing cars loaded with other dangerous articles.

1702. Sections 235 and 236 of the act of March 4, 1909, require the shipper of dangerous articles to describe and mark his packages properly and to inform the agent of the carrier of the true character of their contents. Heavy penalties are provided for the shipper who, knowingly, solicits the transportation of dangerous articles without complying with these requirements, as well as for the carrier that knowingly transports them.

1703. To promote the uniform enforcement of law and to minimize the dangers to life and property incident to the transportation by land in interstate commerce of dangerous articles other than explosives, the following regulations are prescribed to define these articles for freight transportation purposes, to state the precautions that must be observed by the shipper in preparing them for shipment, and by the carrier in handling them while in transit. It is the duty of each such carrier and shipper to make the prescribed regulations effective and to thoroughly instruct their employees in relation thereto.

1704. These regulations apply to all shipments of dangerous articles other than explosives, including carriers' material and supplies.

1705. Specifications as to containers, methods of packing for shipment, etc., will be considered and prescribed from time to time. Orders prescribing such specifications will be given effective dates as conditions and investigations may appear to warrant.

1706. The Bureau for the Safe Transportation of Explosives and other Dangerous Articles, hereinafter called Bureau of Explosives, organized by the railways under the auspices of the American Railway Association, is an efficient bureau in charge of an expert chief inspector. This bureau will make inspections and conduct investigations and will confer with manufacturers and shippers with a view to determining what specifications and regulations will within reasonable limits afford the highest degree of safety in packing and preparing these dangerous articles for shipment and in transporting the same. The Commission will seek to avail itself of the expert knowledge thus developed and, in formulating amendments to these regulations or specifications supplemental thereto, while not bound thereby, will give due weight to such expert opinions.

#### GENERAL RULES.

1711. Carriers that are subject to the act to regulate commerce must not receive shipments of articles defined as dangerous by these regulations when the shipments are not packed, marked, labeled, described, and certified as prescribed herein. The method of manufacture and packing of articles defined as dangerous by these regulations, so far as it affects safe transportation, must be open to inspection by a duly authorized representative of the initial carrier or of the Bureau of Explosives.

1712. All shipments of articles subject to these regulations offered for transportation in interstate commerce must be properly described by the shipper in his shipping order and bill of lading under the specific or general name provided for the description of such freight by the carrier's classification and tariff governing.

The same description of contents must be marked plainly on the outside of each package.

In less-than-carload shipments each package must be marked also to show plainly the name and address of the consignee. This address, the name of contents, and the required label or "no label required" marking, should be as near together as practicable.

1713. All shipments of articles defined as dangerous by these regulations, and for which detailed instructions for pack-

ing are not given herein, must be securely packed in containers strong enough to stand without rupture or leakage of contents all ordinary shocks incident to reasonably careful handling during transit. It is the duty of shippers, where leakage from their shipping containers is known to be a probable source of fire or material damage to other freight, to exercise special care in constructing shipping containers for such articles, even though their names do not appear in the list of dangerous articles, paragraph 1807.

1714. Carriers must forward shipments of dangerous articles other than explosives promptly and within 48 hours after acceptance at originating point or receipt at transfer station or at interchange point, and consignees must remove such shipments from the carriers' property within 48 hours after notice of arrival at destination, Sundays and holidays not included.

1715. (a) *Serious violations of these regulations*, such as the discovery of leaking or broken packages of dangerous articles, *and accidents or fires* in connection with the transportation or storage on carrier's property of dangerous articles, must be reported by the carrier to the chief inspector of the Bureau of Explosives, 30 Vesey Street, New York City.

(b) Consignees should report promptly to the chief inspector, Bureau of Explosives, all instances of broken or defective containers in shipments of dangerous articles received by them.

#### SECTION I. INFORMATION AND DEFINITIONS.

1800. For transportation purposes dangerous articles other than explosives are divided into the following groups:

1. *Forbidden articles.*
2. *Acceptable articles.*

##### GROUP 1.—FORBIDDEN ARTICLES.

1801. The following are *forbidden articles*:

(a) Outside packages containing in the same compartment interior packages, the mixture of whose contents would be liable to cause a dangerous evolution of heat, gas, or corrosive materials.

(b) Cylinders containing gases capable of combining chemically.

(c) Packages containing dangerous articles in a leaking condition or in such an insecure condition as to make leakage probable during transit.

(d) Rags or cotton waste oily with more than 5 per cent of vegetable or animal oil, or wet rags.

(e) Charcoal screenings from wet charcoal, or wet screenings, or screenings that have been wet. (See par. 1833 (c).)

(f) Dangerous articles not properly packed, marked, labeled, described, and certified.

(g) Iron sponge and spent oxide that has not been properly oxidized during manufacture.

## GROUP 2.—ACCEPTABLE ARTICLES.

### Definitions

#### *Inflammable Liquids—Red Label.*

1802. This group includes any liquid or liquid mixture that gives off inflammable vapors (as determined by flash point from Tagliabue's open cup tester, as used for test of burning oils) at or below a temperature of 80° F.

#### *Inflammable Solids—Yellow Label.*

1803. This group includes all substances other than those classified as explosives that are liable under conditions incident to transportation to cause fires by self-ignition through friction, through absorption of moisture, or through spontaneous chemical changes.

#### *Oxidizing Materials—Yellow Label.*

1804. This group includes all substances, such as chlorates, permanganates, peroxides, and nitrates, that yield oxygen readily to stimulate the combustion of organic matter.

#### *Corrosive Liquids—White Label.*

1805. This group includes the strong mineral acids (in strength greater than one-half<sup>1</sup> concentrated, i. e., 47 per cent sulphuric, 34 per cent nitric, 20 per cent hydrochloric) and other strongly corrosive liquids that are liable to cause fires when mixed with chemicals or with organic matter, or are liable, in case of leakage from their shipping containers, to damage other freight materially.

#### *Compressed Gases—Red or Green (Gas) Label.*

1806. This group includes all inflammable or non-inflammable gases assembled for shipment under pressure exceeding 25 pounds per square inch, except when such gases are in cylinders or tubes not exceeding  $\frac{7}{8}$  inch outside diameter and of not more than 4 fluid ounces water capacity.

## LIST OF PRINCIPAL DANGEROUS ARTICLES.

1807. (a) The following list shows the names of well-known articles in general use, other than explosives, that are

(1) For express transportation, greater than one-fourth concentrated.

dangerous; the kind of label required on outside packages; the quantities that may be shipped in one outside package without a label when certified and marked "No label required," and the label exemptions on account of specified packing. (See column 5 of list.)

(b) When a shipment described under a name not in the following list is defined as a dangerous one by paragraphs 1802 to 1806, inclusive, the shipper must inform the carrier of the fact by use of the proper label prescribed herein, and the shipping order must show the certificate prescribed by paragraph 1867. The maximum quantity of any such article shipped in one outside package, without label, when certified and marked "No label required," except as specified herein, must not exceed the limit prescribed by column 3 of the list for dangerous articles of similar flash point or characteristic.

(c) Inflammable liquids as defined by paragraph 1802, in securely closed glass, earthenware, or metal containers of not exceeding one pint capacity each, when flash point is 20° F., or lower, and of not exceeding one quart capacity when flash point is above 20° F., packed and cushioned in fiberboard or corrugated strawboard containers, wooden boxes, kegs, or barrels, complying with shipping container specifications that apply, may be shipped without labels when certified and marked "No label required."

(d) A shipment described under a definite and proper name not in the following list and on a shipping order with no notation as to labels applied and no shipper's certificate, will be assumed by the carrier in the absence of knowledge to the contrary, to be not dangerous under these regulations.

(e) When articles described under names in the following list marked (\*) are not dangerous under the regulations, the shipper must, unless otherwise provided in said list, state on his shipping order, as a part of the description of such article "No label required," and must also furnish the certificate prescribed by paragraph 1867 and mark the package "No label required."

(f) When several dangerous articles are placed in one outside package without violating these regulations, labels must be applied, when the combined quantity of the articles of any one group exceeds the lowest limit prescribed by column 3 for any of the articles of that group that are included.

(g) When dangerous articles requiring the red label are shipped in the same outside package with dangerous articles requiring yellow or white labels, the outside package must be labeled with the red label only.

## LIST OF PRINCIPAL DANGEROUS ARTICLES.

## SECTION II. RULES FOR PACKING.

1821. Dangerous articles for which the yellow and white labels, respectively, are prescribed must not be packed in the same package, unless the bottle containing the corrosive liquid is cushioned by incombustible absorbent material in tightly closed metal containers, as prescribed by paragraph 1851. Cylinders of compressed gases must not be packed with other articles.

1822. (a) The construction of barrels, drums, boxes, cans, carboys, or other containers purchased subsequent to March 31, 1912, and used in shipping dangerous articles other than explosives must conform to specifications approved by the Interstate Commerce Commission that apply; and each container must be stamped, labeled or marked "Complies with I. C. C. Spec'n No. —," or equivalent marking as stated in the specification.

(b) In addition to standing the tests prescribed, the design and construction of packages must be such as to prevent the occurrence in individual packages of defects that permit leakage of their contents under the ordinary conditions incident to transportation. The results of experience, gained by an examination of damaged or broken packages on arrival at destination, must be reported to and recorded by the Bureau of Explosives, to the end that further use of any particular kind of package shown by experience to be inefficient may be prohibited by the Commission.

(c) Pending approval and promulgation by the Commission of specifications for types of shipping containers other than those for which specifications are published herein, containers may be used which after investigation made by the Bureau of Explosives, or by other competent testing laboratory in the presence of a representative of the Bureau of Explosives, are shown to possess the general efficiency and the protection against leakage of contents afforded by the standard types of corresponding capacity described in the specifications published herein, provided they are labeled or marked to show compliance with this requirement.

(d) Tank cars used for the shipment of dangerous articles other than explosives must comply with Master Car Builders' rules, and a tank car that leaks or one that has any defect which would make leakage during transit probable or that has not been tested and stenciled in compliance with Master Car Builders' rules must not be used for the shipment of any inflammable liquid.

(e) The tanks and their fittings must be examined by the shipper to see that they are in proper condition for loading.

Tanks must be examined for evidence of previous leaks; safety and outlet valves, dome covers and outlet-valve caps must be in proper condition before loading; after loading, tanks must not show any dropping of liquid contents at the seams or rivets, and should such dropping appear cars must be properly repaired; outlet valves must not permit more than a dropping of the liquid with valve caps off, otherwise valve must be reground and repaired. Dome covers and valve caps provided with suitable gaskets, must be properly screwed in place before cars are tendered to the carrier.

(f) Loaded tank cars tendered for shipment must be inspected by the carrier to see that they are not leaking, that the air and hand brakes, journal boxes, trucks and safety appliances are in proper condition for service, and that the car has been tested within limits prescribed by Master Car Builders' rules.

(g) Tests of all tank cars and their safety valves, as made in compliance with Master Car Builders' rules, must be certified by the party making the tests to the owner of the tank car and to the chief inspector, Bureau of Explosives; and this certification must show the initials and number of the tank car, the service for which it is suitable, the date of test, place of test, and by whom made.

#### INFLAMMABLE LIQUIDS—RED LABEL.

1824. (a) All inflammable liquids must be shipped in packages complying with specifications that apply as follows:

(b) In tightly closed metal cans of not exceeding 10 gallons capacity, packed in wooden boxes complying with Specification No. 2 or cushioned in wooden barrels or kegs complying with Specification No. 11.

(c) In well-stoppered glass or earthenware vessels of not exceeding 1 gallon capacity, cushioned in wooden boxes complying with Specification No. 2 or cushioned in wooden barrels or kegs complying with Specification No. 11, or in a well-stoppered glass or earthenware vessel of not exceeding 5 gallons capacity, well cushioned in a wooden box and not more than one such vessel in the box. The completed package must comply with swing and drop tests prescribed for boxed carboys by Specification No. 1.

(d) In well-stoppered glass, earthenware or metal vessels of not exceeding 1 pint capacity when flash point is 20° F., or lower, and 1 quart capacity when flash point is above 20° F., cushioned in fiber board or corrugated strawboard containers complying with Specification No. 24.

(e) In wooden kits of not exceeding 10 gallons capacity, packed in wooden boxes complying with Specification No. 2, or cushioned in wooden barrels or kegs complying with Specification No. 11.

(f) In metal-jacketed cans of not exceeding 10 gallons capacity, complying with Specification No. 23.

(g) In well-stoppered carboys of not exceeding 13 gallons capacity, cushioned in wooden boxes complying with Specification No. 1.

(h) In wooden barrels or kegs complying with Specification No. 10 when the flash point of the liquid is not lower than 20° F., or in wooden barrels or kegs complying with Specification No. 9 when the flash point is lower than 20° F., unless otherwise provided in the tariffs under which shipment moves.

(i) In metal barrels or drums complying with Specification No. 5.

(j) In tank cars complying with Master Car Builders' specifications, provided the vapor tension of the inflammable liquid corresponding to a temperature of 100° F. (90° F. Nov. 1 to Mar. 1) does not exceed 10 pounds per square inch. After January 1, 1915, a tank car must not be used for shipping inflammable liquids with flash point lower than 20° F., unless it has been tested with cold-water pressure of 60 pounds per square inch and stenciled as required by Master Car Builders' rules.

(k) Liquefied petroleum gas is a condensate from the "casing-head gas" of petroleum oil wells, whose vapor tension at 100° F. (90° F. Nov. 1 to Mar. 1) exceeds 10 pounds per square inch. Liquefied petroleum gas must be shipped in metal drums or barrels which comply with Specification No. 5, or in tank cars especially constructed and approved for this service by the Master Car Builders' Association. When the vapor pressure at 100° F. exceeds 25 pounds per square inch, cylinders as prescribed for compressed gases (see pars. 1861 to 1863, inclusive) must be used.

(l) Carbon bisulphide in interior packages of capacity greater than  $\frac{1}{2}$  gallon must be shipped in metal cans of not less than 28 gauge, boxed, complying with Specification No. 2; or in metal barrels or drums complying with Specification No. 5, such barrels or drums after January 1, 1916, not to exceed 55 gallons capacity. Carbon bisulphide may also be shipped in tank cars complying with paragraph 1824 (j).

1825. (a) Packages containing inflammable liquids must not be entirely filled. Sufficient interior space must be left vacant to prevent leakage or distortion of containers, due to

increase of temperature during transit. In all such packages, this vacant space must not be less than 2 per cent of the total capacity of the container. In tank cars the vacant space must not be less than 2 per cent of the total capacity of the tank, i. e., the shell and dome capacity, combined. If the dome of tank cars does not provide this 2 per cent, sufficient vacant space must be left in the shell of the tank to make up the difference.

(b) In packages containing alcohol, cologne spirits, high wines or other distilled spirits, the vacant interior space or allowance for wantage or ullage must conform to the United States Internal Revenue Regulations.

1826. Interior packages, containing 1 quart or more of an inflammable liquid, must be packed with their filling holes up and the top of the outside package must be plainly marked "THIS SIDE UP."

1827. Wooden-jacketed cans and wooden kits must not be used for the shipment of inflammable liquids, except as inside containers as provided by Specification No. 2 or 11.

#### LABELS.

1864. (a) Unless exempted on account of quantity or method of packing (see columns 3 and 5, list, par. 1807), all packages containing dangerous articles named in the list, paragraph 1807, and similar articles defined by paragraphs 1802 to 1806, inclusive, must be conspicuously labeled by the shipper. Labels should be applied when practicable to that part of the package bearing the consignee's name and address.

(b) Labels will not be required on packages in carload shipments to be unloaded by the consignee, but the proper placards must be obtained from the carrier and applied by the shipper to the car loaded by him. When it is known, however, that subsequent shipments of these packages in less-than-carload quantities, and in the original outside packages, will probably be made by the consignee, the original manufacturing shipper should attach labels to the packages.

(c) Shippers must furnish and attach the labels prescribed for their packages. Labels must not be applied to packages containing articles which are not subject to these regulations, nor to packages which are exempt from labels on account of quantity or method of packing. (See columns 3 and 5, list, par. 807.) Packages containing articles which are subject to these regulations and which are exempt from labels, must be plainly marked "NO LABEL REQUIRED."

(d) Containers shipped as "EMPTY" (except in carload shipments to be unloaded by consignee) must have the

old red, yellow, white, or green labels removed or completely covered by a square white label measuring not less than 6 inches in each side, and bearing thereon the word "EMPTY" in letters not less than 1 inch high.

1865. Labels must be of diamond shape, with each side 4 inches long. The color is *red* for inflammable liquids and compressed inflammable gases, *yellow* for inflammable solids and oxidizing materials, *green* for noninflammable compressed gases, and *white* for corrosive liquids. Labels must conform to standards as to size, printing, and color, and samples will be furnished, on request, by the chief inspector of the Bureau of Explosives, 30 Vesey street, New York City.

1866. The wording must be in black letters inside of a black line border measuring  $3\frac{1}{2}$  inches on each side, and as follows:<sup>1</sup>

Red label for inflammable liquids. (Reduced size.)

(1) The carrier's name and form number, or the shipper's name and address, may be printed on the labels, in type not larger than 10 point, if placed within the black line border and in the upper or lower corner of the diamond.

Yellow label for inflammable solids and oxidizing materials. (Reduced size.)

#### SHIPPING ORDERS.

1867. (a) Any article subject to these regulations whether label is required or not, must be described on the shipping order under the specific or general name provided for the description of such freight by the carrier's classification and tariff governing.

(b) The shipping order must also show opposite the entry of the article the kind of label applied, or "No label required." For carload lots of such articles loaded by the shipper, the shipping order must show the kind of placard applied to the car, or "No placard required."

(c) The shipping order must also show the following certificate in the lower left-hand corner over the written or stamped facsimile signature of the shipper or of his duly authorized agent:

This is to certify that the above articles are properly described by name and are packed and marked and are in proper condition for transportation according to the

regulations prescribed by the Interstate Commerce Commission.

(d) A shipping order that does not cover the shipment of an article classed as dangerous or doubtful by these regulations must not show thereon the label notation or the certificate prescribed for dangerous articles. Unnecessary certificates and label notations on shipping-order blanks must be canceled by the shipper.

(e) Whenever orders are placed in foreign countries for the importation of dangerous articles to be forwarded from port of entry by rail, the importer must furnish with the order to the foreign shipper and also to the forwarding agent at the port of entry, full and complete information as to the necessary packing, marking, and labeling required by these regulations. The forwarding agent must file with the originating carrier a certified shipping order and must see that the packages are properly packed, marked, and labeled.

#### WAYBILLING.

1873. The revenue or other waybill prepared from the shipping order, and transfer billing to connecting carrier for dangerous articles in list, paragraph 1807 and for other articles not in the list, but properly offered for shipment as dangerous articles, must properly describe these articles by classification or tariff name and state for less-than-carload shipments the color of label applied. For carload shipments they must show the kind of placard applied. The shipper's certificate must be in possession of the initial carrier when these indorsements are made on original billing.

The revenue waybill must also have plainly stamped or written at the top the words "INFLAMMABLE" or "ACID."

#### PLACARDS AND HANDLING CARS.

1901. Carriers must keep on hand an adequate supply of placards. Placards will be furnished by carriers to shippers for attachment to cars loaded by them.

1902. The carrier must verify the attachment of the proper placard by the shipper, as soon as a car requiring a placard is accepted by the carrier for transportation. A daily record showing the initials and numbers of all cars placarded must be kept on file at originating and transfer stations.

1903. (a) When the lading requiring the placard is removed from cars placards must be removed, except that "IN-

FLAMMABLE" placards must remain on *tank* cars moved as "empty" until such cars are known to have been properly cleaned with steam or reloaded with a substance that does not require the placard. As provided in paragraph 1941 (b) acid placards which are painted or stenciled on tank cars may be allowed to remain.

(b) Many fatal accidents have resulted from using lanterns or lighted matches to examine the interior of empty tank cars or in using hot rivets to repair unsteamed tank cars, which may contain inflammable vapors even when the previous lading was not of flash point below 80° F. Only incandescent electric lights should be used for this examination.

(c) Dome covers on empty tank cars must be securely placed in proper position before the cars are offered for movement.

1904. A carrier must not move from a station, yard, or siding a car known to require placards until the proper placards are attached. Placards lost in transit must be replaced by the carrier.

1905. (a) Tank cars placarded "INFLAMMABLE" must be placed in trains, if possible, at least 5 cars from the engine and 5 cars from the caboose, but must not be placed next to a car placarded "EXPLOSIVES." When length of train does not permit this, they must be placed as near the middle of the train as practicable; and in all cases carriers must see that their train crews are informed of the presence and location of such cars in the train.

Special care must be taken to avoid rough treatment and unnecessary switching of placarded tank cars.

(b) The carrier must see that its representative in charge of a freight train makes a thorough check of the cars bearing inflammable, acid, or explosive placards, with the billing, to see that all placards required are attached and those not required are removed.

1906. When cars protected by "INFLAMMABLE" placards are received or held in yards, particularly at night, the carrier must see that all necessary precautions are taken to prevent accidents. These precautions must include provision for quickly isolating them in case of fire.

1907. In classification yards, and in switching, it must be determined by inspection and trial that such a car has its brakes in first-class order before a draft containing it is cut; and a tank car placarded "INFLAMMABLE" must not be started down a ladder track, incline, or hump until the pre-

ceding car has cleared the ladder. It also must clear the ladder before another car is allowed to follow.

1908. (a) Cars bearing "INFLAMMABLE" placards and cars adjacent to them must be watched with extra care to discover hot journals.

(b) All available opportunities must be utilized, by noting the odor of inflammable liquids or otherwise, to discover leaks in these cars and to protect leaking cars from ignition of contents by flame of inspectors' lanterns or torches, by burning fuses, by switch lights, by switchthawing flames, by fires on side of track, by coals from locomotives passing over a roadbed strewn with leakage, or otherwise. (See par. 1956.)

1909. Whenever a tank car, loaded with an inflammable liquid, is discovered in transit in a leaking condition, all unnecessary movement of the car must cease until the unsafe condition of the car is remedied. Every possible precaution necessary to prevent ignition of the contents must be observed and the general precautions indicated in paragraphs 1951 to 1957, inclusive, should be followed.

1912. In unloading tank cars the following rules should be observed:

(a) The dome cover should be unscrewed by placing a bar between the dome-cover lug and the knob; the valve-rod handle in the dome should be moved back and forth a few times, to ascertain if the valve is properly seated, and if seated, the valve cap should then be removed with a suitable wrench, having a pail to catch any liquid that may be in the valve nozzle.

(b) The unloading connection should be securely attached to the valve nozzle, and valve should then be raised by working the valve-rod handle. The dome cover should be placed over the dome opening, resting on a piece of wood, to allow air to enter the tank. The dome cover should not be replaced while unloading, as this action may result in collapse of the tank. After tank is unloaded the valve should be seated, valve cap and dome cover replaced. "INFLAMMABLE" placards must not be removed.

(c) When necessary to unload tank cars from the dome, or when necessary to transfer the contents of one tank car through the outlet valve into the dome of another tank car, care should be observed to see that all of the connections are tight and that the pipe or hose, when inserted into the open manhole for pumping or filling purposes, is surrounded by wet burlap to prevent the escape of vapors and to avoid igniting them.

### INFLAMMABLE PLACARD.

1913. A placard of diamond shape, printed on strong, thin, white paper for pasting on tank cars, containing an inflammable liquid and on strong tag board for tacking to wooden cars or to wooden boards of suitable size attached for this purpose to metal box cars or tank cars, measuring  $10\frac{3}{4}$  inches on each side, and bearing in red and black letters the following inscription, must be securely attached to each outside end and to each side door of a car containing one or more packages protected by the *red* or the *yellow* diamond label:

Inflammable placard. (Reduced size.)

### IN CASE OF A WRECK.

1946. In case of a wreck involving a car containing inflammable freight it should be assumed that packages are broken and that leakage has occurred which may cause fire if lighted lanterns or other flames are taken into or near these cars. As much of the train as possible should be moved to a place of safety. A car containing inflammable freight should be opened for ventilation and packages protected by red labels

and cylinders of compressed gases should be removed to a safe place. Substances spilled from broken packages protected by yellow label should also be carefully removed. Cylinders of compressed gases may be exploded if they are exposed to fire or struck a sharp blow and the flying fragments would then be dangerous. Inflammable liquids spilled from broken packages or tank cars should be well covered with dry earth before a lighted lantern, torch, or an engine is used in the vicinity. Acids spilled in cars should be covered with dry earth and the car floors should be thoroughly swept.

#### LEAKING TANK CARS.

1951. Action in any particular case will depend upon existing conditions, and good judgment will be necessary to avoid disastrous fires on the one hand and the useless sacrifice of valuable property on the other.

Volatile (or combustible) liquids, such as gasoline, naphtha, etc., in large quantity and spread over a large surface will form vapors that will ignite at a considerable distance, depending on the kind and quantity of liquid and the direction and force of the wind. Many of the liquids, regarded as safe to carry under ordinary conditions and transported in tank cars without the inflammable placard, should still be treated as dangerous in handling a wreck.

1952. When oil cars are leaking all lights or fires near them that can possibly be dispensed with should be extinguished or removed. Incandescent electric lights or portable electric flashlights should be used when available. Whenever practicable the work of handling a wrecked oil car should be done during daylight.

1953. Lanterns necessarily used for signaling should be kept on the side from which the wind is blowing and at as high an elevation as can be obtained. The vapors will go with the wind but not against it. The ash pan and fire box of a locomotive or steam derrick, especially on the side of a wrecked or leaking tank car toward which the wind is blowing, is a source of danger. Wrecks involving oil cars should in no case be approached with lighted pipes, cigars, or cigarettes.

1954. Effort should be made to prevent the spread of oil over a large surface by collecting it in any available vessels or draining it into a hole or depression at a safe distance from the track. When necessary, trenches should be dug for this purpose.

It is not safe to drain inflammable oil in large quantities into a sewer, since vapors may thus be carried to distant points and there ignited. Care should be exercised also not to permit oil to drain into streams of water which may be used by irrigation plants or for watering stock. Dry earth spread over spilled oil will decrease the rate of evaporation and the danger. A stream of oil on the ground should be dammed and dry earth be thrown on the liquid as it collects.

1955. Sudden shocks or jars that might produce sparks or friction should be avoided. When possible, jack the wrecked cars carefully into position after removing other cars and freight that might be injured by fire. Only as a last resort, to meet an emergency, should a wrecked tank car be moved by dragging, and when this is done all persons should be kept at a safe distance.

1956. No unnecessary attempt should be made to transport a damaged tank car from which inflammable liquid is leaking. Safety in short movements may be secured by attaching a vessel under small leaks to prevent spread of inflammable liquid over tracks. Cover tracks at intervals in rear of a moving car with fresh earth to prevent fire overtaking the car. Keep engines away; also spectators who may be smoking. If wrecked or derailed, and not in a position to obstruct or endanger traffic, it should have its leak stopped as far as possible and be left under guard until another tank car or sufficient vessels can be provided for the transfer of the liquid, which should be transferred by pumping when practicable.

Even a tank that is not leaking is liable to be ruptured by use of slings, and the slipping of chain slings may produce sparks. Saving of the contents of the tank is not as important as the prevention of fire.

1957. An empty or partially empty tank car, with or without placards, is very liable to contain explosive gases, and lights must not be brought near it.

1958. *Water will not quench an oil fire.*—If the fire can not be smothered by use of earth, steam, or wet blankets, effort should be concentrated on confining it and saving other property.

Office, Washington, D. C., at 20 cents per copy.

REGULATIONS FOR THE TRANSPORTATION OF  
DANGEROUS ARTICLES OTHER THAN EX-  
PLOSIVES BY FREIGHT.

Prescribed under act of March 4, 1909, and section 15 of the act to regulate commerce, as amended June 18, 1910. Revision formulated and published July 2, 1914, effective October 1, 1914, and superseding regulations published January 1, 1912. Further revision formulated and published July 15, 1918, effective September 1, 1918, superseding the regulations published July 2, 1914.

GENERAL NOTICE.

1701. Special precautions are necessary in preparing for shipment packages of dangerous articles other than explosives, and in handling these packages during transit. Any failure of a shipper, or of a carrier, to perform the duties imposed upon him in this respect may be the actual or a contributory cause not only of destructive fires but of disastrous explosions, since large quantities of explosives are transported frequently through thickly populated districts and in trains containing cars loaded with other dangerous articles.

1702. Sections 235 and 236 of the act of March 4, 1909, require the shipper of dangerous articles to describe and mark his packages properly and to inform the agent of the carrier of the true character of their contents. Heavy penalties are provided for the shipper who knowingly solicits the transportation of dangerous articles without complying with these requirements, as well as for the carrier that knowingly transports them.

1703. To promote the uniform enforcement of law and to minimize the dangers to life and property incident to the transportation by land in interstate commerce of dangerous articles other than explosives, the following regulations are prescribed to define these articles for freight transportation purposes, to state the precautions that must be observed by the shipper in preparing them for shipment, and by the carrier in handling them while in transit. It is the duty of each such carrier and shipper to make the prescribed regulations effective and to thoroughly instruct their employees in relation thereto.

1704. These regulations apply to all shipments of dangerous articles other than explosives, including carriers' material and supplies.

1705. Specifications as to containers, methods of packing for shipment, etc., will be considered and prescribed from time to time. Orders prescribing such specifications will be given effective dates as conditions and investigations may appear to warrant.

1706. The Bureau for the Safe Transportation of Explosives and other Dangerous Articles, hereinafter called Bureau of Explosives, organized by the railways under the auspices of the American Railway Association, is an efficient bureau in charge of an expert chief inspector. This bureau will make inspections and conduct investigations and will confer with manufacturers and shippers with a view to determining what specifications and regulations will within reasonable limits afford the highest degree of safety in packing and preparing these dangerous articles for shipment and in transporting the same. The Commission will seek to avail itself of the expert knowledge thus developed and, in formulating amendments to these regulations or specifications supplemental thereto, while not bound thereby, will give due weight to such expert opinions.

#### GENERAL RULES.

1711. Carriers that are subject to the act to regulate commerce must not receive shipments of articles defined as dangerous by these regulations when the shipments are not packed, marked, labeled, described, and certified as prescribed herein. The method of manufacture and packing of articles defined as dangerous by these regulations, so far as it affects safe transportation, must be open to inspection by a duly authorized representative of the initial carrier or of the Bureau of Explosives.

1712. All shipments of articles subject to these regulations offered for transportation in interstate commerce must be properly described by the shipper in his shipping order and bill of lading under the specific or general name provided for the description of such freight by the carrier's classification and tariff governing.

The same description of contents must be marked plainly on the outside of each package. Tank cars must bear thereon a card showing proper name of contents.

In less-than-carload shipments each package must be

marked also to show plainly the name and address of the consignee. This address, the name of contents, and the required label or "no label required" marking, should be as near together as practicable.

1713. All shipments of articles defined as dangerous by these regulations, and for which detailed instructions for packing are not given herein, must be securely packed in containers strong enough to stand without rupture or leakage of contents all ordinary shocks incident to reasonably careful handling during transit. It is the duty of shippers, where leakage from their shipping containers is known to be a probable source of fire or material damage to other freight, to exercise special care in constructing shipping containers for such articles, even though their names do not appear in the list of dangerous articles, paragraph 1807.

1714. Carriers must forward shipments of dangerous articles other than explosives promptly and within 48 hours after acceptance at originating point or receipt at transfer station or at interchange point, and consignees must remove such shipments from the carrier's property within 48 hours after notice of arrival at destination, Sundays and holidays not included.

1715. (a) *Serious violations of these regulations*, such as the discovery of leaking or broken packages of dangerous articles, and accidents or fires in connection with the transportation or storage on carrier's property of dangerous articles, must be reported promptly by the carrier to the chief inspector of the Bureau of Explosives, 30 Vesey Street, New York City.

(b) Consignees should report promptly to the chief inspector, Bureau of Explosives, all instances of broken or defective containers in shipments of dangerous articles received by them.

1716. Containers that have been previously used for dangerous articles other than explosives, must have the old marks and labels removed before being used for the shipment of other articles.

## SECTION 1. INFORMATION AND DEFINITIONS.

1800. For transportation purposes dangerous articles other than explosives are divided into the following groups:

1. *Forbidden articles.*
2. *Acceptable articles.*

## GROUP 1.—FORBIDDEN ARTICLES.

1801. The following are *forbidden articles*:

(a) Outside packages containing in the same compartment interior packages, the mixture of whose contents would be liable to cause a dangerous evolution of heat, gas, or corrosive materials.

(b) Cylinders containing gases capable of combining chemically.

(c) Packages containing dangerous articles in a leaking condition or in such an insecure condition as to make leakage probable during transit.

(d) Rags or cotton waste oily with more than 5 per cent of vegetable or animal oil, or wet rags, or wet textile waste, or wet paper stock.

(e) Charcoal screenings from wet charcoal, or wet screenings, or screenings that have been wet. (See par. 1833 (c).)

(f) Dangerous articles not properly packed, marked, labeled, described, and certified.

(g) Iron sponge that has not been properly oxidized during manufacture; and spent oxide or spent iron mass except when loaded in open steel cars.

## GROUP 2—ACCEPTABLE ARTICLES.

## Definitions.

*Inflammable Liquids—Red Label*

1802. This group includes any liquid or liquid mixture that gives off inflammable vapors (as determined by flash point from Tagliabue's open-cup tester, as used for test of burning oils) at or below a temperature of 80° F.

*Inflammable Solids—Yellow Label*

1803. This group includes all substances other than those classified as explosives that are liable under conditions incident to transportation to cause fires by self-ignition through friction, through absorption of moisture, or through spontaneous chemical changes.

*Oxidizing Materials—Yellow Label*

1804. This group includes all substances, such as chlorates, permanganates, peroxides, and nitrates, that yield oxygen readily to stimulate the combustion of organic matter.

*Corrosive Liquids—White Label*

1805. This group includes the strong mineral acids (in strength greater than one-half<sup>1</sup> concentrated, i. e., 47 per cent sulphuric, 34 per cent nitric, 20 per cent hydrochloric) and other strongly corrosive liquids that are liable to cause fires when mixed with chemicals or with organic matter, or are liable in case of leakage from their shipping containers, to damage other freight materially.

*Compressed Gases—Red or Green (Gas) Label*

1806. This group includes all inflammable or noninflammable gases assembled for shipment under pressure exceeding 25 pounds per square inch, except when such gases are in cylinders or tubes not exceeding seven-eighths inch outside diameter and of not more than 4 fluid ounces water capacity.

## LIST OF PRINCIPAL DANGEROUS ARTICLES.

1807. (a) The following list shows the names of well-known articles in general use, other than explosives, that are dangerous; the kind of label required on outside packages; the quantities that may be shipped in one outside package without a label when certified and marked "No label required," and the label exemptions on account of specified packing. (See column 5 of list.)

(b) When a shipment described under a name not in the following list is defined as a dangerous one by paragraphs 1802 to 1806, inclusive, the shipper must inform the carrier of the fact by use of the proper label prescribed herein, and the shipping order must show the certificate prescribed by paragraph 1867. The maximum quantity of any such article shipped in one outside package without label, when certified and marked, "No label required," except as specified herein, must not exceed the limit prescribed by column 3 of the list for dangerous articles of similar flash point or characteristics.

(c) Inflammable liquids as defined by paragraph 1802, in securely closed glass, earthenware, or metal containers of not exceeding 1 pint capacity each (ether 1 1/10 pounds), when flash point is 20° F., or lower, and of not exceeding one quart capacity when flash point is above 20° F., packed and cushioned in fiber board or corrugated strawboard containers, wooden boxes, kegs, or barrels, complying with shipping con-

---

NOTE—Hand fire extinguishers containing non-liquefied gas for the purpose of expelling fire-extinguishing contents are excepted.

---

(1) For express transportation, greater than one-fourth concentrated.

tainer specifications that apply, may be shipped without labels when certified and marked "No label required."

(d) A shipment described under a definite and proper name not in the following list and on a shipping order with no notation as to labels applied and no shipper's certificate, will be assumed by the carrier in the absence of knowledge to the contrary, to be not dangerous under these regulations.

(e) When articles described under names in the following list marked with (\*) are not dangerous under the regulations, the shipper must, unless otherwise provided in said list, state on his shipping order, as a part of the description of such article, for less than carloads, "No label required," and for carloads, state on his shipping order "No placard required," and must also furnish the certificate prescribed by paragraph 1867 and mark the packages "No label required."

(f) When several dangerous articles are placed in one outside package without violating these regulations, labels must be applied, when the combined quantity of the articles of any one group exceeds the lowest limit prescribed by column 3 for any of the articles of that group that are included.

(g) When dangerous articles requiring the red label are shipped in the same outside package with dangerous articles requiring yellow or white labels, the outside package must be labeled with red label only.

## SECTION 2

## RULES FOR PACKING.

1821. Dangerous articles for which the yellow and white labels, respectively, are prescribed must not be packed in the same package, unless the bottle containing the corrosive liquid is cushioned by incombustible absorbent material in tightly closed metal containers, as prescribed by paragraph 1851. Cylinders of compressed gases must not be packed with other articles.

1822. (a) Barrels, drums, cylinders, boxes, cans, carboys, and other containers used hereafter for the shipment of dangerous articles other than explosives, must be made in accordance with approved specifications that apply and must be properly marked to show compliance with those specifications.

Such containers manufactured and used hereafter must be made in accordance with the specifications that apply as prescribed herein.

Such containers manufactured before the effective date of the specifications prescribed herein may be used if they were made in accordance with specifications previously approved.

Provided, that cylinders manufactured previous to the date on which specifications therefor were first made effective may be used if they comply with the requirements of paragraph 1861 of these regulations. Provided further, that carboys and metal barrels or drums manufactured and purchased prior to the date on which specifications were first made effective, may be used if they are in good condition and afford a package as secure as packages constructed under corresponding specifications.

(b) In addition to standing the tests prescribed, the design and construction of packages must be such as to prevent the occurrence in individual packages of defects that permit leakage of their contents under the ordinary conditions incident to transportation. The results of experience, gained by an examination of damaged or broken packages on arrival at destination, must be reported to and recorded by the Bureau of Explosives, to the end that further use of any particular kind of package shown by experience to be inefficient may be prohibited by the Commission.

(c) Pending approval and promulgation by the Commission of specifications for types of shipping containers other than those for which specifications are published herein, con-

tainers may be used which after investigation made by the Bureau of Explosives, or by other competent testing laboratory in the presence of a representative of the Bureau of Explosives, are shown to possess the general efficiency and the protection against leakage of contents afforded by the standard types of corresponding capacity described in the specifications published herein, provided they are labeled or marked to show compliance with this requirement.

(d) Tank cars used for the shipment of dangerous articles other than explosives must comply with Master Car Builders' specifications, and a tank car that leaks or one that has any defect which would make leakage during transit probable or that has not been tested and stenciled in compliance with Master Car Builders' specifications must not be used for the shipment of any inflammable liquid.

(e) The tanks and their fittings must be examined by the shipper to see that they are in proper condition for loading. Tanks must be examined for evidence of previous leaks; safety and outlet valves, dome covers, and outlet-valve caps must be in proper condition before loading; tanks must be loaded with outlet valve caps off; after loading, tanks must not show any dropping of liquid contents at the seams or rivets, and should such dropping appear cars must be properly repaired by calking; outlet valves must not permit more than a dropping of the liquid with valve caps off, otherwise valve must be reground and repaired. Dome covers and valve caps provided with suitable gaskets must be properly screwed in place before cars are tendered to the carrier.

(f) Loaded tank cars tendered for shipment must be inspected by the carrier to see that they are not leaking; that the air and hand brakes, journal boxes, trucks, and safety appliances are in proper condition for service; and that the car has been tested within limits prescribed by Master Car Builders' specifications.

(g) Tests of all tank cars and their safety valves, as made in compliance with Master Car Builders' specifications, must be certified by the party making the tests to the owner of the tank car and to the chief inspector, Bureau of Explosives, and this certification must show the initials and number of the tank car, the service for which it is suitable, the date of test, place of test, and by whom made.

#### *Inflammable Liquids—Red Label*

1824. (a) All inflammable liquids must be shipped in packages complying with specifications that apply, as follows:

(b) In tightly closed metal cans of not exceeding 10 gai-

lons capacity, packed in wooden boxes complying with Specification No. 2 or cushioned in wooden barrels or kegs complying with Specification No. 11.

(c) In well-stoppered glass or earthenware vessels of not exceeding 1 gallon capacity, cushioned in wooden boxes complying with Specification No. 2 or cushioned in wooden barrels or kegs complying with Specification No. 11, or in a well-stoppered glass or earthenware vessel of not exceeding 5 gallons capacity, well cushioned in a wooden box and not more than one such vessel in the box. The completed package must comply with swing and drop tests prescribed for boxed carboys by Specification No. 1.

(d) In well-stoppered glass, earthenware, or metal vessels of not exceeding 1 pint capacity when flash point is 20° F., or lower, and 1 quart capacity when flash point is above 20° F., cushioned in fiber board or corrugated strawboard containers complying with Specification No. 24.

(e) In wooden kits of not exceeding 10 gallons capacity, packed in wooden boxes complying with Specification No. 2, or cushioned in wooden barrels or kegs complying with Specification No. 11.

(f) In metal-jacketed cans of not exceeding 10 gallons capacity, complying with Specification No. 23.

(g) In well-stoppered carboys of not exceeding 13 gallons capacity, cushioned in wooden boxes complying with Specification No. 1.

(h) In wooden barrels or kegs complying with Specification No. 10 when the flash point of the liquid is not lower than 20° F., or in wooden barrels or kegs complying with Specification No. 9 when the flash point is lower than 20° F., unless otherwise provided in the tariffs under which shipment moves.

(i) In metal barrels or drums complying with Specification No. 5.

(j) In tank cars complying with Master Car Builders' specifications provided the vapor tension of the inflammable liquid corresponding to a temperature of 100° F. does not exceed 10 pounds per square inch. A tank car must not be used for shipping inflammable liquids with flash point lower than 20° F., unless it has been tested with cold-water pressure of 60 pounds per square inch and stenciled as required by Master Car Builders' specifications, and is equipped with safety valves set to operate at 25 pounds per square inch, and with mechanical arrangement for closing dome cover as specified in paragraph 1824 (k).

(k) Liquid condensates from natural gas or from casing head gas of oil wells, made either by the compression or absorption process, alone or blended with other petroleum products, must be described as Liquefied Petroleum Gas when the vapor pressure<sup>1</sup> at 100° F. (90° F. November 1 to March 1) exceeds 10 pounds per square inch.

When the liquid condensate, alone or blended with other petroleum products, has a vapor pressure not exceeding 10 pounds per square inch, it must be described and shipped as Gasoline, Casinghead Gasoline, or Casinghead Naphtha.

Liquefied petroleum gas of vapor pressure exceeding 10 pounds per square inch and not exceeding 15 pounds per square inch, from April 1 to October 1 and 20 pounds per square inch from October 1 to April 1, must be shipped in metal drums or barrels which comply with Shipping Container Specification No. 5; or in special insulated tank cars approved for this service by the Master Car Builders' Association.

Liquefied petroleum gas of vapor pressure exceeding 15 or 20 pounds per square inch as provided herein, and not exceeding 25 pounds per square inch, must be shipped only in metal drums or barrels which comply with Shipping Container Specification No. 5.

Liquefied petroleum gas of vapor pressure exceeding 25 pounds per square inch must be shipped in cylinders as prescribed for compressed gases (see pars. 1861 to 1863, inclusive).

When the liquid condensate, alone or blended with other petroleum products, has a vapor pressure not exceeding 10 pounds per square inch it must be described as Gasoline or Casinghead Gasoline or Casinghead Naphtha and must be shipped in metal drums or barrels complying with Specification No. 5; or in ordinary tank cars, 60 pounds test class equipped with mechanical arrangement for closing of dome covers as specified in Master Car Builders' specifications for tank cars.

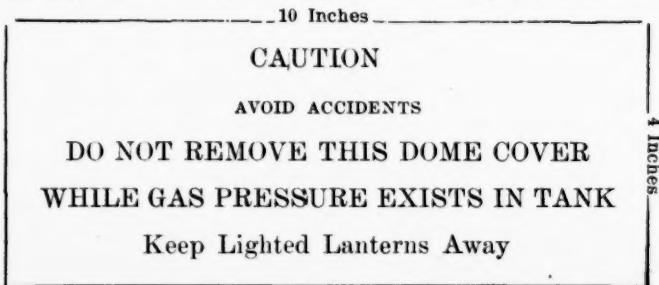

Every tank car containing liquid condensates, either blended or unblended, including liquefied petroleum gas, as defined herein, must have safety valves set to operate at 25 pounds per square inch with a tolerance of 3 pounds above or below, and the mechanical arrangements for closing the dome covers of such cars must either be such as to make it practically impossible to remove the dome cover while the interior of the car is subjected to pressure; or suitable vents that will

---

(1) In measuring the vapor pressure the container may be vented momentarily at a temperature of 70° F.

be opened automatically by starting the operation of removing the dome cover must be provided:

The shipper must attach securely and conspicuously to the dome and dome cover three special white dome placards measuring 4x10 inches, bearing the following wording:

One placard must be attached to each side of the dome and one placard must be attached to the dome cover. The presence of these special dome placards must be noted on the shipping order by the shipper and by the carrier on the billing accompanying the car. Placards must conform to samples furnished by the Chief Inspector of the Bureau of Explosives.

(1) Carbon bisulphide in interior packages of capacity greater than one-half gallon must be shipped in metal cans of not less than 28 gauge, boxed, complying with Specification No. 2; or in metal barrels or drums complying with Specification No. 5, such barrels or drums not to exceed 55 gallons capacity. Carbon bisulphide may also be shipped in tank cars complying with paragraph 1824 (j).

1825. (a) Packages containing inflammable liquids must not be entirely filled. Sufficient interior space must be left vacant to prevent leakage or distortion of containers, due to increase of temperature during transit. In all such packages this vacant space must not be less than 2 per cent of the total capacity of the container. In tank cars the vacant space must not be less than 2 per cent<sup>1</sup> of the total capacity of the tank, i. e., the shell and dome capacity, combined. If the dome of tank cars does not provide this 2 per cent, sufficient vacant space must be left in the shell of the tank to make up the difference.

(b) In packages containing alcohol, cologne spirits, high

(1) An outage of 2 per cent is frequently insufficient for light petroleum products, owing to the fact that they expand more than heavier petroleum products when the temperature increases, and this rate of expansion varies with the specific gravity of the material. It is recommended that when

wines, or other distilled spirits of 150 proof or over the vacant interior space or allowance for wantage or ullage must be the maximum permitted by the United States Internal Revenue Regulations.

1826. Interior packages containing 1 quart or more of an inflammable liquid must be packed with their filling holes up and the top of the outside package must be plainly marked "THIS SIDE UP."

1827. Wooden-jacketed cans and wooden kits must not be used for the shipment of inflammable liquids, except as inside containers as provided by Specification No. 2 or 11.

#### LABELS.

1864. (a) Unless exempted on account of quantity or method of packing (see columns 3 and 5, list, par. 1807), all packages containing dangerous articles named in the list, paragraph 1807, and similar articles defined by paragraphs 1802 to 1806, inclusive, must be conspicuously labeled by the shipper. Labels should be applied when practicable to that part of the package bearing the consignee's name and address.

(b) Labels will not be required on packages in carload shipments to be unloaded by the consignee, but the proper placards must be obtained from the carrier and applied by the shipper to the car loaded by him. When it is known, however, that subsequent shipments of these packages in less-than-carload quantities, and in the original outside packages, will probably be made by the consignee, the original manufacturing shipper should attach labels to the packages.

(c) Shippers must furnish and attach the labels prescribed for their packages. Labels must not be applied to packages containing articles which are not subject to these regulations, nor to packages which are exempt from labels on account of quantity or method of packing. (See columns 3 and 5, list, par. 1807.) Packages containing articles which are subject to these regulations and which are thus exempt from labels, must be plainly marked "NO LABEL REQUIRED."

tank cars are loaded with gasoline, casing-head gasoline or casing-head naphtha (see Par. 1824 (k)) the outage in tank shall not be less than the following.

Temperature of product when loaded.	Minimum outage required when gravity is—		
	50-60° B. Per cent.	60-70° B. Per cent.	70-80° B. Per cent.
0- 60° F.....	3.2	3.5	4.1
61- 70° F.....	2.5	2.8	3.3
71- 80° F. . . . .	2.0	2.1	2.4
81-100° F. . . . .	2.0	2.0	2.0

(d) Containers shipped as "EMPTY" (except in car-load shipments to be unloaded by consignee) must have the old red, yellow, white, or green labels removed or completely covered by a square white label measuring not less than 6 inches on each side, and bearing thereon the word "EMPTY" in letters not less than 1 inch high

1865. Labels must be of diamond shape, with each side  $\frac{4}{8}$  inches long. The color is *red* for inflammable liquids and compressed inflammable gases, *yellow* for inflammable solids and oxidizing materials, *green* for noninflammable compressed gases, and *white* for corrosive liquids. Labels must conform to standards as to size, printing, and color, and samples will be furnished, on request, by the chief inspector of the Bureau of Explosives, 30 Vesey Street, New York City.

1866. The wording must be in black letters inside of a black line border measuring  $3\frac{1}{2}$  inches on each side, and as follows:<sup>1</sup>

Red label for inflammable liquids. (Reduced size.)

(1) The carrier's name and form number, or the shipper's name and address, may be printed on the labels, in type not larger than 10 point, if placed within the black line border and in the upper or lower corner of the diamond. A combination diamond-shaped label tag of proper color, bearing on one side the shipping information and on the reverse side the wording prescribed herein, will be permitted.

Yellow label for inflammable solids and oxidizing materials. (Reduced size.)

#### SHIPPING ORDERS.

1867. (a) Any article subject to these regulations whether label is required or not, must be described on the shipping order under the specific or general name provided for the description of such freight by the carrier's classification and tariff governing

(b) The shipping order must also show opposite the entry of the article the color of label applied, or "No label required." For carload lots of such articles loaded by the shipper, the shipping order must show the kind of placard applied to the car, or "No placard required."

(c) The shipping order must also show the following certificate in the lower left-hand corner over the written or stamped facsimile signature of the shipper or of his duly authorized agent:

This is to certify that the above articles are properly described by name and are packed and marked and are

in proper condition for transportation according to the regulations prescribed by the Interstate Commerce Commission.

(d) A shipping order that does not cover the shipment of an article classified as dangerous or doubtful by these regulations must not show thereon the label notation or the certificate prescribed for dangerous articles. Unnecessary certificates and label notations on shipping-order blanks must be canceled by the shipper.

(e) Whenever orders are placed in foreign countries for the importation of dangerous articles to be forwarded from port of entry by rail, the importer must furnish with the order to the foreign shipper and also to the forwarding agent at the port of entry, full and complete information as to the necessary packing, marking, and labeling required by these regulations. The forwarding agent must file with the originating carrier a certified shipment order and must see that the packages are properly packed, marked, and labeled.

#### WAYBILLING.

1873. The revenue or other waybill prepared from the shipping order and transfer, or any other billing delivered to connecting carrier for dangerous articles in list, paragraph 1807, and for other articles not in the list but properly offered for shipment as dangerous articles, must properly describe these articles by classification or tariff name and state for less-than-carload shipments the color of label applied. For carload shipments they must show the kind of placard applied, and when the lading is not dangerous but is properly described by one of the doubtful names, distinguished by an asterisk in the list, paragraph 1807, the billing for the car must be indorsed "No placard required." The shipper's certificate must be in possession of the initial carrier when these indorsements are made on original billing.

The revenue waybill for any dangerous article requiring red or yellow or white labels must also have plainly stamped or plainly written on the face and above the center line thereof, in letters not less than three-eighths of an inch high, the words "INFLAMMABLE" or "ACID."

#### PLACARDS AND HANDLING CARS.

1901. Carriers must keep on hand an adequate supply of placards. Placards will be furnished by carriers to shippers for attachment to cars loaded by them.

1902. (a) The carrier must verify the attachment of the

proper placard by the shipper as soon as a car requiring a placard is accepted by the carrier for transportation.

(b) Special care must be taken to avoid rough treatment and unnecessary switching of placarded cars.

(c) A daily record showing the initials and numbers of all loaded cars placarded must be kept on file at originating, transfer stations and interchange points.

1903. (a) When the lading requiring the placard is removed from cars, placards must be removed, except that "IN-FLAMMABLE" placards when offered for movement or as "empty" until such cars are known to have been properly cleaned with steam or reloaded with a substance that does not require the placard. As provided in paragraph 1941 (b) acid placards which are painted or stenciled on tank cars may be allowed to remain.

(b) Many fatal accidents have resulted from using lanterns or lighted matches to examine the interior of empty tank cars or in using hot rivets to repair unsteamed tank cars, which may contain inflammable vapors even when the previous lading was not of flash point below 80° F. Only incandescent electric lights should be used for this examination.

(c) Outlet valve caps and dome covers must be securely placed in proper position on empty tank cars requiring "IN-FLAMMABLE" placards when offered for movements or when transferred to or from connecting lines in interchange.

1904. A carrier must not move from a station, yard, or siding a car known to require placards until the proper placards are attached. Placards lost in transit must be replaced by the carrier.

1905. (a) Tank cars placarded "INFLAMMABLE" must be placed in trains, if possible, at least five cars from the engine and five cars from the caboose, but must not be placed next to a car placarded "EXPLOSIVES." When length of train does not permit this they must be placed as near the middle of the train as practicable, and in all cases carriers must see that their train crews are informed of the presence and location of such cars in the train.

(b) The carrier must see that its representative in charge of a train and a yard or terminal from which a freight train starts makes a thorough check and record of the cars bearing "INFLAMMABLE" or "ACID" and "EXPLOSIVES" placards with the billing to see that all placards required are attached; that those not required are removed;

and that placarded cars are properly placed in trains, as required by these regulations.

1906. When cars protected by "INFLAMMABLE" placards are received or held in yards, particularly at night, the carrier must see that all necessary precautions are taken to prevent accidents. These precautions must include provision for quickly removing and isolating them in case of fire. When such cars are held in yards for a period longer than 12 hours, they must be placed where they will be readily accessible for prompt removal in case of fire or explosion. A separate track or tracks, when available, must be designated at terminal classification or receiving yards for such cars, and cars must be coupled at all times during such holding. The carrier's representative in charge must be informed at all times of the presence and location of such cars placarded "INFLAMMABLE."

1907. In classification yards and in switching it must be determined by inspection and trial that such a car has its brakes in first class order before a draft containing it is cut, and a tank car placarded "INFLAMMABLE" must not be started down a ladder track, incline, or hump until the preceding car has cleared the ladder. It also must clear the ladder before another car is allowed to follow.

1908. (a) Cars bearing "INFLAMMABLE" placards and cars adjacent to them must be watched with extra care to discover hot journals.

(b) All available opportunities must be utilized by noting the odor of inflammable liquids or otherwise to discover leaks in these cars and to protect leaking cars from ignition of contents by flame of inspectors' lanterns or torches, by burning fusees, by switch lights, by switch-thawing flames, by fires on side of track, by coals from locomotives passing over a roadbed strewn with leakage, or otherwise. (See par. 1956.)

1909. Whenever a tank car loaded with an inflammable liquid is discovered in transit in a leaking condition all unnecessary movement of the car must cease until the unsafe condition of the car is remedied. Every possible precaution necessary to prevent ignition of the contents must be observed, and the general precautions indicated in paragraphs 1951 to 1957, inclusive, should be followed.

NOTE.—Tank cars containing inflammable liquids that are to be offered in interchange should be inspected on the track where transfer is assembled for delivery to receiving line. If a tank car is found in leaking condition, it must not be offered

in interchange. Where actual interchange to receiving line is distant from point of delivery by delivering line, and repair facilities are provided, if such a tank car develops a leak en route to the receiving line interchange track, the receiving line should accept the car, taking every possible precaution to prevent ignition of contents and handling the car as indicated in paragraphs 1909, 1951 to 1957.

1912. In unloading tank cars the following rules should be observed:

(a) The dome cover should be unscrewed by placing a bar between the dome-cover lug and the knob; the valve-rod handle in the dome should be moved back and forth a few times to ascertain if the valve is properly seated, and if seated, the valve cap should then be removed with a suitable wrench, having a pail to catch any liquid that may be in the valve nozzle.

(b) The unloading connection should be securely attached to the valve nozzle, and valve should then be raised by working the valve-rod handle. The dome cover should be placed over the dome opening, resting on a piece of wood, to allow air to enter the tank. The dome cover should not be replaced while unloading, as this action may result in collapse of the tank. After tank is unloaded the valve should be seated, valve cap and dome cover replaced. "INFLAMMABLE" placards must not be removed.

(c) When necessary to unload tank cars from the dome, or when necessary to transfer the contents of one tank car through the outlet valve into the dome of another tank car, care should be observed to see that all of the connections are tight and that the pipe or hose, when inserted into the open manhole for pumping or filling purposes, is surrounded by wet burlap to prevent the escape of vapors and to avoid igniting them.

(d) When the "blowing" of safety valves of a car containing inflammable liquids is noted, any available means for cooling the car shell and contents, such as spraying with water, should be utilized; and if practicable the car should be moved to an isolated point, to minimize the fire risk. Covering the safety valves with wet cloth, wet blankets, or wet gunny sacks will decrease the danger of igniting vapors escaping from a "blowing" valve. The burning of these vapors at the safety valve is not liable to cause an explosion. The valves are designed to permit, in emergencies, the burning in this way of the entire contents of the car.

### INFLAMMABLE PLACARD.

1913. A placard of diamond shape, printed on strong, thin, white paper for pasting on tank cars, and on strong tag board for tacking to wooden cars or to wooden boards of suitable size attached for this purpose to metal box cars or tank cars, measuring  $10\frac{3}{4}$  inches on each side, and bearing in red and black letters the following inscription, must be securely attached to each outside end and to each side door of a box or stock car containing one or more packages protected by the *red* or the *yellow* diamond label, and to each side and end of a tank car containing an inflammable liquid:

Inflammable placard. (Reduced size.)

### IN CASE OF A WRECK.

1946. In case of a wreck involving a car containing inflammable freight it should be assumed that packages are broken and the leakage has occurred which may cause fire if lighted lanterns or other flames are taken into or near these cars. As much of the train as possible should be moved to a place of safety. A car containing inflammable freight should

be opened for ventilation and packages protected by red labels and cylinders of compressed gases should be removed to a safe place. Substances spilled from broken packages protected by yellow label should also be carefully removed. Cylinders of compressed gases may be exploded if they are exposed to fire or struck a sharp blow and the flying fragments would then be dangerous. Inflammable liquids spilled from broken packages or tank cars should be well covered with dry earth before a lighted lantern, torch, or an engine is used in the vicinity. Acids spilled in cars should be covered with dry earth and the car floor should be thoroughly swept.

#### LEAKING TANK CARS.

1951. Action in any particular case will depend upon existing conditions, and good judgment will be necessary to avoid disastrous fires on the one hand and the useless sacrifice of valuable property on the other.

Volatile (or combustible) liquids, such as gasoline, naphtha, etc., in large quantity and spread over a large surface will form vapors that will ignite at a considerable distance, depending on the kind and quantity of liquid and the direction and force of the wind. Many of the liquids, regarded as safe to carry under ordinary conditions and transported in tank cars without the inflammable placard, should still be treated as dangerous in handling a wreck.

1952. When oil cars are leaking all lights or fires near them that can possibly be dispensed with should be extinguished or removed. Incandescent electric lights or portable electric flash lights should be used when available. Whenever practicable the work of handling a wrecked oil car should be done during daylight.

1953. Lanterns necessarily used for signaling should be kept on the side from which the wind is blowing and at as high an elevation as can be obtained. The vapors will go with the wind but not against it. The ash pan and fire box of a locomotive or steam derrick, especially on the side of a wrecked or leaking tank car toward which the wind is blowing, is a source of danger. Wrecks involving oil cars should in no case be approached with lighted pipes, cigars, or cigarettes.

1954. Effort should be made to prevent the spread of oil over a large surface by collecting it in any available vessels or draining it into a hole or depression at a safe distance from the track. When necessary, trenches should be dug for this purpose.

It is not safe to drain inflammable oil in large quantities into a sewer, since vapors may thus be carried to distant points and there ignited. Care should be exercised also not to permit oil to drain into stream of water which may be used by irrigation plants or for watering stock. Dry earth spread over spilled oil will decrease the rate of evaporation and the danger. A stream of oil on the ground should be dammed and dry earth be thrown on the liquid as it collects.

1955. Sudden shocks or jars that might produce sparks or friction should be avoided. When possible, jack the wrecked cars carefully into position after removing other cars and freight that might be injured by fire. Only as a last resort, to meet an emergency, should a wrecked tank car be moved by dragging, and when this is done all persons should be kept at a safe distance.

1956. No unnecessary attempt should be made to transport a damaged tank car from which inflammable liquid is leaking. Safety in short movements may be secured by attaching a vessel under small leaks to prevent spread of inflammable liquid over tracks. Cover tracks at intervals in rear of a moving car with fresh earth to prevent fire overtaking the car. Keep engines away; also spectators who may be smoking. If wrecked or derailed, and not in a position to obstruct or endanger traffic, it should have its leak stopped as far as possible and be left under guard until another tank car or sufficient vessels can be provided for the transfer of the liquid, which should be transferred by pumping when practicable.

Even a tank that it not leaking is liable to be ruptured by use of slings, and the slipping of chain slings may produce sparks. Saving of the contents of the tank is not as important as the prevention of fire.

1957. An empty or partially empty tank car, with or without placards, is very liable to contain explosive gases, and lights must not be brought near it.

1958. *Water will not quench an oil fire.*—If the fire can not be smothered by use of earth, steam, or wet blankets, effort should be concentrated on confining it and saving other property.

**Government's Exhibit 69.**

File F-1

Dec. 29, 1915.

Mr. W. P. Donovan, Supt. Gypsy Oil Co., Kiefer, Okla.

Dear Sir: Your letter Dec. 23rd, enclosing letter from Mr. Donohue, Agent, Frisco, with reference to routing of shipments for Port Arthur, for the present until further advise, via Frisco to Ashdown, KCS beyond. In checking up I find the time is practically the same via both routes, and as both the KCS and S. P. reach our refinery at Port Arthur, it is our intention to divide this business, and when it is equalized I will advise you when to begin routing Frisco S. P.

Yours truly,

CC—Mr. W. A. Looney

(Signed) C. B. Ellis

Chas. B. Ellis, Traffic Manager

Mr. W. P. Donovan,

Supt., Gypsy Oil Company, Kiefer, Okla.

Dear Sir: Please refer to my letter of December 29th, File F-1, requesting that all shipments for Port Arthur be routed via Frisco to Ashdown—K. C. S. beyond until further orders.

This business has not yet been equalized. I would be glad to have you arrange to route two-thirds of the business via Frisco to Ashdown—K. C. S. beyond, and one-third by Frisco to Sherman—H. & T. C. to West Port Arthur. This to be continued until we have equalized the business between the two lines as it is our desire to give the Southern Pacific and Kansas City Southern an equal share of this business, both of which reach our refinery at Port Arthur.

Yours truly,

(Signed) C. B. Ellis.

**Government's Exhibit 75.**

(The A. T. & S. F. Ry. General Feb 10 '17 Agent  
Tulsa, Okla.)

**GYPSY OIL COMPANY**

Gasoline Department

W. P. Donovan, General Superintendent

Tulsa, Okla., February 9th, 1917.

Mr. P. T. McKirahan, General Agent,

A. T. & S. F. Railway Company, Tulsa, Oklahoma.

Dear Sir: In further reference to the gasoline loading rack track we intended to have constructed on your line at Drumright, Oklahoma, I now understand that your company will not permit the placing of gasoline loading racks within 400 feet of your main line. The Bureau of Explosives recommend loading racks be placed at least 100 feet from the main line, and I consider that distance ample under all ordinary conditions, and our Drumright loading rack track would not be an exception.

It seems to me that rules and regulations governing the shipment and handling of gasoline are laid down by railroads, and others, without giving the matter involved due consideration. I understand there are certain things permitted by the railroads in handling gasoline that reputable gasoline shippers would consider extremely dangerous, and on the other hand certain methods are used by gasoline shippers where the fire risk is considered by them very small and the railroads consider the risk extremely hazardous. A tank car of gasoline on fire 100 feet away from the main line would not likely endanger moving cars on that line. When gasoline is once ignited it is the easiest kind of an oil fire to control, as it is rarely ever leaves the container which holds it, whereas, a tank of crude oil on fire would boil over and probably spread the fire a great distance.

Would it not be possible for representatives of your company to meet with the Executive Committee of the Casinghead Gasoline Producers Association of America at a meeting to be held by them at Tulsa, Oklahoma, at 2 o'clock Friday afternoon, February 16th, 1917, to discuss the shipping of casinghead gasoline from all angles. I feel that nearly all of the gasoline shippers want to work in harmony with the railroads and do their part toward carrying the standard of safety to the highest point, but to ask them to build loading racks 400 feet away from a main line would be, in most cases, a physical impossibility, and in no instance, unless in a congested dis-

trict, would it add anything to the safety of the railroad company.

Very truly yours,

Gypsy Oil Company—Gasoline Dep't,

D-M

(Signed) W. P. Donovan, Gen'l Sup't.

Cy. A. J. Pfister. 811 South Boulder.

---

**Government's Exhibit 76.**

File 12-29

Tulsa, November 10th, 1916.

Drumright, Okla: Proposed Spur for Gypsy Oil Company:  
Mr. J. R. Koontz,

General Freight Agent, Topeka, Kansas.

Dear Sir: Further replying to your letter, File R-2646, November 7th, above subject.

I have succeeded in getting a very conservative estimate from the Gypsy Oil Company, Gasoline Department, on the business which this new gasoline plant at Drumright will bring us.

They estimate that there will be shipped forty carloads of gasoline, per month, which will go to their refinery at Port Arthur, Texas. Inbound they estimate thirteen or fourteen carloads of naptha, per month, which will come from Port Arthur. These cars will average about 65,000 pounds to the car. I do not have the tariff showing the freight rate, but presume you have same in your office.

There has, or will be, about seven cars of cement and twenty-eight cars of stone from Dewey, and fourteen carloads of sand from Tulsa. This business would move intra-state, and we would only secure the haul from Jennings.

There will be four carloads of compressors from Painted Post, New York, and five carloads of gas engines from Grove City, Pennsylvania. There will also be twenty-one carloads of steel tanks, set-up, which will be shipped from Kansas City.

These people are very anxious to get this track constructed without any unnecessary delay, and would appreciate it very much if you will expedite the handling, and urge our operating officials to hurry to conclusion.

Yours truly,

(Signed) P. T. McKirahan

It is stipulated by the parties that the succeeding months of this statement bear the heading "Un-refined naphtha", and that printing of the balance of the statement be dispensed with.

**Government's Exhibit 81.**

(Received May 5 1917 9 AM Gen'l Auditor's Office)

**GULF REFINING COMPANY**

George H. Tabor, Vice President

Port Arthur, Texas

Refineries:

Port Arthur, Texas; Fort Worth, Texas

A. D. Morgan,

Local Auditor

May 2, 1917.

Mr. L. S. Haskell, General Auditor,  
Gulf Refining Company, Pittsburgh, Pa.

Dear Sir: Our April Yield Statement will show, as a receipt, 146 cars of Gasoline from Kiefer, at a total of 1,098,604 gallons, against a billing from the Gypsy Oil Company—Gasoline Department—of 1,164,303 gallons, a difference of 65,699 gallons, which is accounted for by the fact that the cars arrived here with very large outages.

Attached you will find a list of the cars, showing outages, our receipts, and their billing.

Yours very truly,

P  
cc enc—Mr. Donovan.

(Signed) A. D. Morgan

Mr. M. R. Powers,

A. G. F. A., St. L. & S. F. RR., St. Louis, Mo.

Dear Sir: Referring to telephone conversation

We want to move 10 cars of gasoline from Kiefer to Port Arthur, to be handled in our own boats to our Eastern distributing stations.

I find nothing but a 37 cent rate published from Kiefer to Port Arthur. Will you kindly arrange to publish a 33 cent rate from Kiefer to Port Arthur, this rate being the same as the northbound rate from Port Arthur to Tulsa, as shown in Leland's tariff #35-I.

If this movement proves satisfactory, I am sure that there will be more of it to move. This business would route via Frisco in connection with K. C. S., or Frisco in connection with the H. & T. C.

I believe that I can induce the Kansas City Southern to participate with you in the 33 cent rate, but, as you originate the business, no doubt you can handle this feature with them.

I must have some information not later than noon tomorrow. Please be sure to call me by long distance telephone at our expense.

Yours truly,

(Signed) C. B. Ellis.

If we make shipment it will have to move immediately and could be handled in shape of reparation claim same as from Ft. Worth to Kiefer. C. B. E.

Gasoline—rates on—from points in Oklahoma to Beaumont-Port Arthur District.

Mr. C. B. Ellis, T. M.,

Gulf Refining Co., Pittsburgh, Pa.

Dear Sir: Some one has suggested cancellation of item 2546-B, Supplement 40, SWL Tariff 26-T, offering as an excuse that continuation of this figure may jeopardize rates of 27 and 39 cents respectively to Texas Common point territory.

We shall be governed by your requirements in the premises, as to the cancellation of Item 2546-B and shall thank you to fully advise by return mail.

Yours truly,

wmp-bm

Mr. W. M. Powers,

A. G. F. A., St. L. S. F. R. R. Co., St. Louis, Mo.

Dear Sir: Your letter May 29th, SWL A/L-8425-C, in which you advise that someone suggested cancellation of Item 2546-B, Supplement 40, SWL Tariff 26-T.

We do not want this rate cancelled as it is in daily use. We are now moving about eighteen cars per week on this rate.

Yours truly,

(Signed) C. B. Ellis.

Mr. J. R. Christian,  
G. F. A., Sunset Central Lines, Houston, Texas.

Mr. F. G. Reilly,  
A. F. T. M., Frisco Lines, St. Louis, Mo.

Gentlemen: This will acknowledge receipt of your favor January 19th, file A-7159-C, with reference to conversation in St. Louis relative to rates from Port Arthur to Kiefer and Kiefer to Port Arthur, as well as from North Fort Worth to Kiefer and Kiefer to North Fort Worth.

I have gone into this matter from all angles and am going to ask that you arrange for the publication of 30 cents from Port Arthur to Kiefer and 30 cents Kiefer to Port Arthur, and 25 cents from North Fort Worth to Kiefer and from Kiefer to North Fort Worth, applying on naphtha and gasoline.

The present rates between above mentioned points are unreasonable to the extent that they exceed above requested rates, and also exceed published rates from other producing points where the mileage haul and conditions are similar.

Please advise at your earliest possible convenience as to what action in the premises will be taken.

Yours truly,

(Signed) C. B. Ellis.

Rate Adjustment: Naptha—Port Arthur, Tex. to Kiefer, Okla.

Mr. C. B. Ellis, T. M.,  
Gulf Refining Co., Pittsburgh, Pa.

Dear Sir: Referring to your joint letter of Feb. 9th File 17-A, regarding publication of rate of 30 cents on naphtha Port Arthur, Tex. to Kiefer, Okla. Also the same rate in the reverse direction on gasoline and in addition a rate of 25 cents from North Ft. Worth to Kiefer.

Your application has been given careful consideration and this is to advise that in view of present conditions, that of our traffic not yielding sufficient revenue to pay cost of operation and the further fact that we are now endeavoring to increase rather than reduce rates, it will be impracticable to establish the rates at this time which you propose.

Yours truly,

wmp-bm

File 17-a-Frisco

Special Delivery.

Mr. W. M. Powers,

AGFA, St. L. &amp; S. F. RR., St. Louis, Mo.

Dear Sir: Referring to my long distance telephone conversation this morning, relative to docketing subject for the San Antonio meeting tomorrow—rate 33 cents per hundred pounds, Naphtha, from Port Arthur and West Port Arthur to Kiefer, Okla.

We are figuring on from 50 to 75 cars of naphtha per month from Port Arthur to Kiefer. I find that the present rate of 43 cents per hundred pounds is prohibitive.

I would thank you to arrange for this 33 cent rate in connection with the Kansas City Southern and Sunset Lines at the earliest possible date.

In Mr. Leland's #35-I, at the present time, there is a 33 cent rate on refined petroleum and its products—Port Arthur and West Port Arthur to Tulsa and we should have a rate not to exceed this rate to Kiefer.

This naphtha is being moved from Port Arthur to Kiefer to be further refined at that point in connection with products now at Kiefer and the outbound shipments will consist of gasoline and, for each car of naphtha moved into Kiefer, there is approximately two cars of gasoline outbound.

I hope that you will have this matter presented at the meeting at San Antonio and, if necessary, give definite notice, having rate published at the very earliest possible date as we will want to begin shipment before the middle of next month. This is absolutely new business.

Would thank you to favor me with advice at the earliest possible date if rate will be arranged for, stating on what date same will become effective.

Yours truly,

(Signed) C B. Ellis

CC-Messrs. Christian and Mitchell.

Mr. F. C. Reilly,

A. F. T. M., St. L. S. F. R. R., St. Louis, Mo.

Dear Sir: Confirming my telegram t-day requesting that you arrange for publication of seventeen cent rate applying

both north and southbound between Port Arthur, West Port Arthur and Kiefer, on same relative basis as this product is published in Item 3022 $\frac{1}{2}$ , Supplement 41, Leland's 26-T, Item 3559 in Supplement No 3 to 59-G, and in Item 3696 Leland's 44-I.

All of our products from Port Arthur and North Fort Worth is an unfinished product, and is passed through the refinery at Kiefer, and the products secured from this partial refining at Kiefer is an unfinished product and is transported to our Port Arthur refinery, and at that point further refined, and we are entitled to the unrefined rate as outlined above.

I will be glad to have you advise if you will arrange for the publication of these rates by your line between North Fort Worth and Kiefer, and Kiefer and North Fort Worth, in connection with the Southern Pacific and K. C. S. to Port Arthur. Am sending copy of this letter to Mr. Mitchell and Mr. Christian at St. Louis, asking that they participate in this rate.

It was my intention to be in St. Louis to-day, but owing to having to go East tonight, it is impossible for me to be there.

Yours truly,

(Signed) C. B. Ellis.

No. 3994

National Refining Company

v.

Missouri, Kansas & Texas Railway Company et al.

Submitted October 19, 1911, Decided May 7, 1912.

Complainant shipped from Muskogee, Okla., to Coffeyville, Kan., a number of carloads of the so-called lighter ends of petroleum oil, which had been separated from the crude oil by a process of skimming, but was useless for commercial purposes until a further process of refinement had been undergone. Defendants assessed the rates applicable to refined oil; Held, that a reasonable rate on the commodity shipped would not have exceeded by more than 2 cents per 100 pounds the rates contemporaneously applicable to crude oil, which relationship should be established for the future. Reparation awarded.

E. J. Blandin and C. D. Chamberlain for complainant.

Joseph M. Bryson, C. S. Burg, and J. W. Allen for Missouri, Kansas & Texas Railway Company.

Herbert J. Campbell for Missouri Pacific Railway Company and St. Louis, Iron Mountain & Southern Railway Company.

**REPORT OF THE COMMISSION.**

By the Commission:

The complainant is a corporation engaged in the oil business and has a refinery at Coffeyville, Kans. In its petition, filed April 5, 1911, it alleges that unreasonable rates were charged by defendants for the transportation from Muskogee, Okla., to Coffeyville of a certain distillate of petroleum oil consisting of the lighter ends of the crude oil. Reparation and the establishment of a reasonable rate are sought.

The oil in question was purchased F. O. B. cars at Muskogee from two concerns, the Merchants Oil Company and the Muskogee Refining Company, and was shipped by these concerns for complainant's account and under its instructions. Of the 77 carloads covered by freight bills filed in the record, 51 moved over the Missouri, Kansas & Texas Railway between October 8, 1909, and March 25, 1910. The weight of these shipments aggregated 2,900,159 pounds, and charges

were paid by complainant in the sum of \$3,480.02, based on a rate on 12 cents per 100 pounds.

The remaining 26 carloads moved over the Missouri, Oklahoma & Gulf Railway and the St. Louis, Iron Mountain & Southern Railway, hereinafter referred to as the Iron Mountain route, the charges being assessed at various rates. During November and December, 1909, 10 carloads, of an aggregate weight of 573,091 pounds, were shipped, and charges were collected thereon in the sum of \$859.62, at a rate of 15 cents per 100 pounds. From March 24 to April 30, 1910, 9 carloads, of an aggregate weight of 529,089 pounds, were shipped, and charges were paid in the sum of \$634.90, at a rate of 12 cents per 100 pounds. During May, 1910, 7 carloads, of an aggregate weight of 363,707 pounds, were shipped, and charges were paid thereon in the sum of \$1,309.35, at a rate of 36 cents.

The distance from Muskogee to Coffeyville over the Iron Mountain route is 98 miles. The rate of 12 cents per 100 pounds charged by the Missouri, Kansas & Texas Railway Company was the rate applicable to the transportation of crude oil during all of the period when these shipments were made. Over the Iron Mountain route a rate of 15 cents for the transportation of crude oil was in force during November and the greater part of December, 1909. Effective December 25, 1909, this rate was reduced to 12 cents, and so remained until June 30, 1910, when it was further reduced to 10 cents per 100 pounds. The rate of 36 cents charged on the 7 shipments in May, 1910, was the fifth-class rate applicable to the transportation of refined oil. On September 12, 1910, the Missouri, Kansas & Texas reduced its rate on refined oil, Muskogee to Coffeyville, from 36 to 17 cents; but the rate on refined oil, over the Iron Mountain route is still 36 cents; although to Kansas City and certain other points to which the traffic moves through Coffeyville this route maintains 17-cent rate on refined oil. At the time that the crude-oil rate was reduced to 10 cents the Iron Mountain route established a rate of 12 cents on fuel oil, which had formerly taken the same rate as crude oil. The rate on crude oil was reduced from 15 to 12 cents via the Missouri, Kansas & Texas on February 13, 1909, and via the Iron Mountain route on December 25, 1909.

Under the Western Classification petroleum oil and its products are rated fifth class. But it has been the practice of carriers in this territory to fix commodity rates lower than the class rates between points where there is any considerable movement of petroleum oil, and these commodity rates have

come to be the normal rates in comparison with which other rates for the transportation of petroleum oil and its products in this territory are to be measured.

The rates on crude oil, as named above, over both routes were commodity rates, but no commodity rate on refined oil between Muskogee and Coffeyville was published until September 12, 1910, which was subsequent to the movement of all the shipments under consideration; and, therefore, if they are to be classed as refined oil, the lawful rate on all of these shipments, under the tariffs in force, was 36 cents. It is the contention of the carriers that they should have been so charged. Complainant asserts that they should have moved under the rates applicable to the transportation of crude oil, and that in view of the reduction in the rate on crude oil to 10 cents per 100 pounds, though that reduction was made subsequently to these shipments, the charges should be based on a rate not exceeding 10 cents per 100 pounds.

Upon the arrival of the shipments at Coffeyville they were examined by an inspector of the Western Railway Weighing & Inspection Bureau, who classified the commodity as a refined, oil, and thereupon bills for the difference between the amount paid and the amount that would have been paid, based on the rate applicable to refined oil, were presented to complainant. These undercharge bills, amounting to about \$8,000, have not been paid, complainant refusing payment until the proper rate has been determined by the Commission.

The product that was shipped seems to have no distinct commercial designation or trade name; by complainant it is referred to as "crude product," one of the shippers described it in the bills of lading as "crude benzine"; the carriers classed it as refined oil. The evidence shows that the crude oil had undergone a skimming process, and that this commodity was one of the two resulting products. The Muskogee crude, as it comes from the well, has too low a fire test to be salable as fuel oil; by the skimming process the lighter ends of the oil are extracted, and the heavier residue becomes marketable as fuel oil.

This skimming process is accomplished by distillation carried just far enough to separate the lighter from the heavier oil, the former amounting to about one-fourth part of the oil. The extracted product, though not separated in accordance with any specifications, may, therefore, properly be roughly described as a light end distillate, and that designation will be used in this report. It was this product that was shipped, and complainant's testimony was to the effect that it had no commercial value except for refining purposes; that

at complainant's refinery it was kept separate from the crude oils and refined into gasoline, naphtha, turpentine substitute, and a residuum sold as fuel oil.

For refining purposes this light-end distillate commanded a higher price than the crude oil from which it was extracted. Complainant's president testified that the price of the Muskogee crude oil at the time of purchase was 2 cents per gallon; he was not certain, but thought he paid 3 cents for the light-end distillate. The information of defendants was to the effect that the price was  $3\frac{1}{4}$  cents. Complainant's president testified that, at the time of this purchase, he was in special need of material for lighter-end products, and for this reason was willing to pay a price higher than is customary for this distillate. Under ordinary circumstances it would be more profitable to use a straight crude oil.

Complainant's testimony was to the effect that this light-end distillate met a specific demand that was not met by the crude oil, and that, in view of this demand, a higher price was paid for it than would be paid for the crude oil. Whether or not that demand was a special one, existing only at that particular time so far as complainant is concerned, does not affect the essential facts.

As we have seen, the rate of 36 cents on refined oil at the times these shipments moved was the fifth class rate, and was applicable only because no commodity rate had been established between Muskogee and Coffeyville. Its unreasonableness is clearly indicated by the fact that, a few months later, one of the routes established a commodity rate of 17 cents, less than one-half of the class rate, and the other route maintains a 17-cent rate to points much more distant than Coffeyville. Moreover, this light-end distillate, while it had been increased in value by a process of manufacture, was not what is commercially understood as a refined product of petroleum oil. It was of value only as a material for further process of refinement, and its price of  $3\frac{1}{2}$  cents was materially below the prices of the articles into which it was ultimately separated. If 17 cents per 100 pounds is a reasonable rate for the transportation of gasoline, naphtha, and other products of petroleum oil, it is too high for the movement of this light-end distillate.

In determining rate to be applied to the transportation of this commodity we are assisted by the action of one of the routes in regard to fuel oil, on which it has established a rate of 2 cents in excess of the rate on crude oil. Fuel oil is produced from the Muskogee crude oil by the identical process that extracts this light-end distillate. Each has under-

gone the same degree of manufacture, and, while there is some difference between the prices of the fuel oil and the light-end distillate, the gap between them is not so great as that which separates them from the commercially refined products. The record leads us to conclude that a rate not more than 2 cents per 100 pounds in excess of the rate on crude oil would be a reasonable rate from Muskogee to Coffeyville on this distillate.

Complaint is made that the crude-oil rates of 12 and 15 cents applied to some of these shipments was unjust and unreasonable. The evidence presented in support of this contention is a reference to the subsequent reduction of the rate to 10 cents and a number of exhibits showing the rates on crude oil between various points. Upon the record we are not convinced that these rates of 12 and 15 cents were unreasonable at the times they were in force. The commission has repeatedly held that the voluntary reduction of a rate is not satisfactory proof of the unreasonableness of the prior rate.

Upon consideration of all the facts appearing of record, the Commission is of opinion and finds that a rate for the transportation from Muskogee to Coffeyville of the light-end distillate produced by the so-called skimming process that exceeded the rate contemporaneously charged for the transportation of crude oil by more than 2 cents was unjust and unreasonable, and that the carriers defendant herein should establish and maintain for a period of not less than two years this relationship between the rates on crude oil and this light-end distillate.

We further find that complainant made the shipments as described in the foregoing statement of facts; that the charges paid by complainant, in the sum of \$1,309.35, at a rate of 36 cents, on 7 carloads of this light-end distillate which moved during May, 1910, over the lines of the Missouri, Oklahoma & Gulf Railway and St. Louis, Iron Mountain & Southern Railway, as hereinbefore set forth, were unjust and unreasonable so far as they exceeded \$509.19, the charges which would have accrued at the reasonable rate of 14 cents per 100 pounds; that complainant has been damaged in the difference between said amounts; and that it is, therefore, entitled to reparation from said defendants in the sum of \$800.16, with interest from August 15, 1910.

We further find that the rate of 36 cents per 100 pounds claimed by defendants on the remaining shipments was unjust and unreasonable so far as it exceeded 14 cents per 100 pounds for the transportation over the Missouri, Kansas & Texas Railway, and so far as it exceeded 17 cents on the ship-

ments prior to December 25, 1909, over the Missouri, Oklahoma & Gulf Railway and the St. Louis, Iron Mountain & Southern Railway, and so far as it exceeded 14 cents on shipments over the latter route after December 25, 1909. The payments on these several shipments having been less than the amounts here found to be just and reasonable, the carriers should collect the amounts due thereon.

The record indicates, as noted, that there is no trade name or commercial designation for the commodity here in question; and we deem it best to leave the description of this commodity, in the first instance, to defendants, who are doubtless able to so amend their tariffs as to establish the rates above found reasonable in such language as will not lend itself to misunderstanding or afford opportunities for misbilling. If the tariffs are not amended within sixty days so as to conform to our conclusions, an order respecting the rates for the future will be entered. An award of reparation will be made at this time.

**Government's Exhibit 135.**

Confirmation of telegram forwarded from Gulf Building, Houston, Texas, via Gulf Pipe Line Company's telegraph service.

(Stamped:) Received Gasoline Dep't File .... Aug 12 1918 Copy to ..... Referred to, ..... Ansd ..... No Ans. Req'd .....

Date August 10, 1918. To W. P. Donovan At Tulsa, Okla. From C. B. Ellis At Houston, Texas.

If any of the rail lines decline to handle unrefined naphtha shipments via rail lines and junction points previously given you, hold up the cars and wire me immediately. Do not want any cars to reach Port Arthur via H&TC or T&NO but they must reach Port Arthur in connection with the Kansas City Southern. This will also apply to shipments from Electra, which should be handled by the GC&SF from Ft. Worth and Kansas City Southern from Beaumont. Have you heard anything further from the Frisco wreck and how did our tank cars and contents fare as compared with the insulated cars? Which cars stood the shock best? 10:35

**GULF REFINING COMPANY**

Petroleum and Its Products

G. R. Nutty, Vice President,

Frick Building Annex, Pittsburgh, Pa.

Sales Department: Chas. B. Ellis, Traffic Manager.

May 12th, 1917. File 17-A.

Personal

Mr. W. P. Donovan,  
Supt. Gypsy Oil Co., Tulsa, Okla.

Mr. L. M. Klein,  
T&CA. Gulf Pipe Line Co., Tulsa, Okla.

Gentlemen:

Referring to my wire today.

The K.C.S. was the line that took the initiative to insist on publication of the 19-1/2c rate Unrefined Naphtha between Port Arthur and Oklahoma points and it was my desire to favor them with this Cleveland business via MK&T to Shreveport—KCS to Port Arthur but unfortunately in the publication of Tariff #79 page 80 is so constructed that the rate will not apply from Cleveland to Port Arthur via the MK&T and KCS.

The heading at the bottom of the page—"From Midland Valley Stations—Big Heart—Glen Pool—Muskogee—Tulsa" was inserted in error.

It was the intention that these rates apply from both Midland Valley and MK&T as headed in item 454, but by including the MV stations above T&FS only it prohibits the application of the rate from MK&T points via that line, including Cleveland.

We now have up endeavoring to have this eliminated from the tariff in less than the statutory notice of 30 days. If successful, I would prefer handling via MK&T and KCS at the present time. However, we cannot do so until supplement covering has been issued. If it is possible to hold up a few days longer I will wire you just as soon as I know the date, but if necessary to move the business be sure to route MK&T to Dallas—T&NO to Port Arthur at rate of 19-1/2c per 100 lbs.

Yours truly,

CBE-RFH

---

Director General of Railroads, has taken possession and assumed control of certain transportation systems described in the Proclamation of the President, of which Proclamation and Order officers, agents and employees of said transportation systems are to take immediate and careful notice. In addition to the provisions therein contained, it is.

UNTIL FURTHER ORDER, DIRECTED THAT:

1. All officers, agents and employees of such transportation systems may continue in the performance of their present regular duties, reporting to the same officers as heretofore and on the same terms of employment.

2. Any officer, agent or employee desiring to retire from his employment shall give the usual and seasonable notice to the proper officer to the end that there may be no interruption or impairment of the transportation service required for the successful conduct of the war and the needs of general commerce.

3. All transportation systems covered by said Proclamation and Order shall be operated as a national system of transportation, the common and national needs being in all instances held paramount to any actual or supposed corporate advantage. All terminals, ports, locomotives, rolling stock and other transportation facilities are to be fully utilized to carry out this purpose without regard to ownership.

4. The designation of routes by shippers is to be disregarded when speed and efficiency of transportation service may thus be promoted.

5. Traffic agreements between carriers must not be permitted to interfere with expeditious movements.

6. Through routes which have not heretofore been established because of short hauling or other causes, are to be established and used whenever expedition and efficiency of traffic will thereby be promoted; and if difficulty is experienced in such through routing, notice thereof shall by carriers or shippers or both be given at once to the Director by wire.

7. Existing schedules of rates and outstanding orders of the Interstate Commerce Commission are to be observed, but any such schedules of rates or orders as may hereafter be found to conflict with the purposes of said Proclamation or with this order shall be brought immediately by wire to the attention of the Director.

W. G. McAdoo,  
Director General of Railroads.

Defendant's Exhibit 140.

**Defendant's Exhibit 142.**

In the District Court of the United States for the Eastern District of Texas, Texarkana Division. The Texas Company, Plaintiff, against Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads, Defendants.

The plaintiff above named by its attorneys, complaining of the defendants, shows to this Court and alleges:

**FIRST: FOR A CAUSE OF ACTION.**

1. That the plaintiff, The Texas Company, at all the times hereinafter mentioned, was and still is a domestic corporation duly created by and existing under and by virtue of the Laws of the State of Texas, having its office and principal place of business at Houston, in said State.

2. That the defendant, Texarkana & Fort Smith Railroad Company, at all the times hereinafter mentioned, was and still is a domestic corporation, duly created by and existing under and by virtue of the laws of the State of Texas, having an office in Texarkana, in said State.

3. That the defendant, Walker D. Hines, is Director General of Railroads, by virtue of appointment by the President of the United States, made under and by virtue of Section 8 of the Federal Control Act, approved March 21, 1918, and has exercised and continues to exercise supervision and control over the properties and operations of said Texarkana & Fort Smith Railroad Company, and that the said Walker D. Hines, acting in the capacity aforesaid, has issued an order directing that actions at law and suits in equity growing out of the possession, use, control or operation of any railroad or system of transportation by the Director General of Railroads, which action, suit or proceeding but for Federal Control might have been brought against the Carrier, shall be brought against the said Director General of Railroads.

4. That the amount in controversy in this action exceeds, exclusive of interest and costs, the sum of Three Thousand Dollars (\$3,000) and it is brought to enforce rights arising under the laws of the United States and more particularly under the laws of the United States regulating Commerce, to-wit: The Act to Regulate Commerce, approved February 4, 1887, and acts supplemental thereto and amendatory thereof.

5. The plaintiff in and by its charter is authorized to and is engaged in producing, refining and distributing petroleum and its products.

6. The defendants, Texarkana & Fort Smith Railroad Company, and Director General of Railroads, are common carriers for hire by railroad, and as such are engaged in the transporting of property between places in different states of the United States, and are thus subject to the provisions of said Act to Regulate Commerce, its supplements and amendments, and the property of the said defendant, Texarkana & Fort Smith Railroad Company, is now being operated in its behalf by said Director General under said Federal Control Act.

7. Defendant, Texarkana & Fort Smith Railroad Company, has heretofore established, and there has been maintained by said Railroad Company and Director General with other connecting carriers by railroad, common arrangements for the continuous carriage of property by their railroads from Kiefer, Jenks, and other points in the State of Oklahoma, to Port Arthur, in the State of Texas, and with respect thereto, through routes and joint rates have been duly published, posted and filed with the Interstate Commerce Commission, as required by said Act to Regulate Commerce.

8. That the plaintiff, the Texas Company, at certain points in the State of Oklahoma, among which are Kiefer and Jenks, has at the times hereinafter referred to, derived a liquid from natural gas by a compression process. This liquid has been blended or mixed with a product described as naphtha, until vapor tension of the mixtures was brought below 10 pounds per square inch at a temperature of 100 degrees Fahrenheit. That said Naphtha is mixed or blended with the said liquid derived from natural gas in about equal parts therewith, and the mixed and blended product has been shipped by the plaintiff, The Texas Company, in tank cars from Kiefer and Jenks, Oklahoma, to Port Arthur, in the State of Texas, and such shipments were made continuously from Jenks during the period from January 14, 1918, to April 30, 1918, and from Kiefer during the period from January 22, 1918, to November 20, 1919, and are more particularly hereinafter set forth.

9. The said shipments so made by plaintiff, The Texas Company, from Kiefer and Jenks, in the State of Oklahoma, to Port Arthur, Texas, have been made over the following railroad lines, including the lines of Texarkana & Fort Smith Railroad Company, under through routing and joint rates: Midland Valley Railroad, Kansas City Southern Railway, Texarkana & Fort Smith Railroad Company. That all of said shipments have been made with freight charges collect and all freight charges assessed against said shipments have been

paid by the plaintiff, The Texas Company. That upon all of said shipments so made, the plaintiff, the Texas Company, has been required to pay and has paid the rates specified for Gasoline, as here set forth: that the plaintiff, The Texas Company, has paid said freight charges to Texarkana & Fort Smith Railroad Company.

10. That in said tariffs are carried rates on a commodity denominated "Unrefined Naphtha." That rates on said "Unrefined Naphtha" are specified in said tariffs from Kiefer and other points in the State of Oklahoma, to Port Arthur, Texas. That the rates given in said tariffs for "Unrefined Naphtha" are as between the same points lower than the rates given on "Gasoline." That all rates on "Unrefined Naphtha" given in said tariffs from different points in Oklahoma to Port Arthur, Texas, are, and at all the times herein mentioned, have been, the same.

11. That during all the period hereinabove mentioned, a competitor of the plaintiff, the Gulf Refining Company, has made shipments as a continuous practice from Kiefer and other points in Oklahoma, to Port Arthur, Texas, of a product of the same sort and kind, belonging to the same class, and

having the same general qualities, and destined for the same use, as the said product shipped by the plaintiff, The Texas Company; and said shipments made by said competitor of The Texas Company, the plaintiff, have been made in tank cars, and the service in the transportation of such shipments has been rendered under circumstances and conditions substantially similar to the circumstances and conditions under which service in the transportation of said shipments made by the plaintiff, The Texas Company, were made; that said shipments thus made by said competitor of the plaintiff, The Texas Company, have been routed and hauled over lines of the same railroads as said shipments made by the plaintiff, The Texas Company, and also over other routings. That upon all said shipments made by said competitor of the plaintiff, The Texas Company, the rates charged thereon have been the rates specified for "Unrefined Naphtha." The said rates specified for "Unrefined Naphtha" from Kiefer to Port Arthur, are given below and as well the rates from Jenks to Port Arthur, which are the same as from Kiefer to Port Arthur; said rates being applicable on all routings specified in said tariffs.

## TO PORT ARTHUR, TEXAS:

## UNREFINED NAPHTHA, Carload.

Kiefer, Okla.	(1) 19½c	(2) 24½c	(3) 24c

## TARIFF.

(1) Item 452 p. 80,	Southwestern Lines Tariff 79, ICC No. 1186
Item 705 p. 81	Southwestern Lines Tariff 79-A ICC No. 1219
(2) Item 705 p. 81 & Sup. 4,	Southwestern Lines Tariff 79-A ICC No. 1219
(3) Item 705 p. 81 & Sup. 5,	Southwestern Lines Tariff 79-A ICC No. 1219
Item 705 p. 92	Southwestern Lines Tariff 79-B ICC No. 1263
Item 705 p. 97	Southwestern Lines Tariff 79-C ICC No. 1233

12. That there is set forth in "Exhibit 'A'" which is hereto annexed and made a part hereof, a statement showing each shipment made by the plaintiff, The Texas Company, as above alleged during said period, and the amounts paid thereon as freight charges, together with the amounts assessable as freight charges against said shipment upon basis of rates allowed to said competitor of the plaintiff.

13. That because of said difference in rates imposed for like and contemporaneous service under substantially similar circumstances and conditions, The Texas Company, the plain-

tiff, has been required to pay and has paid sums grossly in excess of the rates which it would have paid had it enjoyed the same rates as those accorded to its competitor during the period hereinabove referred to.

14. That the Gulf Refining Company has by reason of said difference in rates applied to said shipments been enabled to market certain products derived or developed from the commodities so shipped by it at an expense less than that required to be borne by the plaintiff, The Texas Company, in the marketing of similar commodities.

15. That the plaintiff, The Texas Company, markets the product derived by it from the commodity shipped as hereinabove set forth, in competition with the Gulf Refining Company in marketing its product derived from the commodity as hereinabove set forth.

16. That by reason of said unjust discrimination and because of the difference in rates hereinabove set forth as applied to the plaintiff, The Texas Company, and its competitor, the Gulf Refining Company, the plaintiff has sustained loss and been damaged in its business. That the plaintiff, The Texas Company, has been injured and damaged by the defendants' unjustly discriminatory acts and deeds forbidden, and done in violation of said Act to Regulate Commerce, its amendments and supplements, in the sum of Fifteen Thousand, One Hundred and Thirty-seven and Thirty-seven One Hundredths Dollars (\$15,137.37).

Wherefore, the plaintiff demands judgment against the defendants, and each of them, jointly and severally, for the sum of Fifteen Thousand, One Hundred Thirty-seven and Thirty-seven One Hundredths Dollars (\$15,137.37), together with interest and costs of this action.

#### SECOND: FOR A SECOND CAUSE OF ACTION.

That the plaintiff, The Texas Company, hereby incorporates, adopts, repeats and re-alleges each and every of the allegations set forth above and contained in paragraphs 1-16, inclusive, of the First Cause of Action, with the same purpose and effect as though here set out at length.

That under the tariffs herein referred to, duly posted and filed with the Interstate Commerce Commission, as required by said Act to Regulate Commerce, and effective at the times herein mentioned, the rates justly, fairly and properly applicable to the shipments herein set forth as made by the plaintiff, The Texas Company, and the only rates thus ap-

plicable are the rates charged to said competitor of the plaintiff, The Texas Company, on its shipments as above set forth, and that all freight charges against said shipments paid by the plaintiff over and above the charges which would have been made against said shipments had the same rates been accorded to the plaintiff on its shipments as were accorded to said competitor of the plaintiff on said shipments made by said competitor, were overcharges.

That the overcharges thus made by the defendants and paid by the plaintiff amount to the sum of Fifteen Thousand One Hundred Thirty-seven & Thirty-seven One Hundredths Dollars (\$15,137.37), as is set forth in "Exhibit 'A'," and the plaintiff, The Texas Company, has been injured and has suffered damage in its business by reason of said overcharges to the extent and the amount thereof.

Wherefore, the plaintiff demands judgment against the defendants, and each of them, jointly and severally, for the sum of Fifteen Thousand One Hundred Thirty-seven & Thirty-seven One Hundredths Dollars (\$15,137.37), together with interest and the costs of this action.

(Endorsed on back) No. 87. The Texas Company *vs.* Texarkana & Ft. Smith Railroad Company and Walker D. Hines, Director General of Railroads. Copy certified. Original bill of Complaint. Filed Jan'y 24, 1920. J. R. Blades, Clerk, by J. B. Furrentine, Deputy.

---

In the District Court of the United States for the Eastern District of Texas. At Texarkana, Texas.

I, J. R. Blades, Clerk of the District Court of the United States, for the Eastern District of Texas at Texarkana, in the Fifth Circuit and District aforesaid, do hereby certify the foregoing to be a true and correct copy of Original Bill of Complaint, in cause No. 87 on the Law Docket of said Court entitled: The Texas Company *vs.* Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads as the same now appears on file and of record in my office.

To Certify Which, witness my hand and the seal of said Court at Texarkana in said district, this 6th day of April, A. D. 1920.

J. R. Blades,

Clerk U. S. District Court, E. D. T.

(Seal)

By J. B. Furrentine, Deputy.

(Endorsed on back:) No. 88. U. S. District Court, Eastern District of Texas at Texarkana, Texas. The Texas Company *vs.* Texarkana & Ft. Smith Railroad and Walker D. Hines, Director General of Railroads. Certified copy of Original Bill of Complaint.

---

#### **Defendant's Exhibit 143.**

In the District Court of the United States for the Eastern District of Texas. Gulf Refining Company, Complainant, against Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads, and G. C. Weddell, Defendants.—No. 212, in Equity.

#### **BILL OF COMPLAINT.**

To the Honorable Judges of the District Court of the United States, for the Eastern District of Texas, Sitting in Equity:

The complainant, Gulf Refining Company, brings this suit in equity against Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads and G. C. Weddell, the defendants, and alleges:

## First.

The complainant, Gulf Refining Company, is a corporation duly organized and existing under the laws of the State of Texas, having its principal office and place of business at Port Arthur, in said State; and the defendant Texarkana & Fort Smith Railroad Company is a corporation organized and existing under the laws of the State of Texas, having an office at Port Arthur, in said State. Walker D. Hines is Director General of Railroads by virtue of appointment by the President of the United States, and has exercised and continues to exercise supervision and control over the properties and operations of said Texarkana & Fort Smith Railroad Company and that the said Walker D. Hines, acting in the capacity aforesaid has issued an order directing that actions at law and suits in equity growing out of the possession, use, control or operation of any railroad or system of transportation by the Director General of Railroads, which action, suit or proceedings but for Federal control might have been brought against the carrier, shall be brought against the said Director General of Railroads; and the said G. C. Weddell is agent at Port Arthur, of the said Texarkana and Fort Smith Railroad Company and of the said Walker D. Hines, Director General of Railroads, hereinafter called Director General.

## Second.

The amount in controversy in this suit exceeds, exclusive of interest and costs, the sum or value of three thousand dollars (\$3,000), and it is brought to protect and enforce rights arising under laws of the United States, and under a law of the United States regulating commerce, to-wit: The Act of Regulate Commerce, approved February 4, 1887, and acts supplemental thereto and amendatory thereof, and the act known as the Federal Control Act, approved March 21, 1918; and it is brought in equity to avoid a multiplicity of suits at law, and because immediate and irreparable loss and damages will result to complainant unless the relief prayed for herein is granted.

## Third.

1. Complainant, in and by its charter, is authorized to and, amongst other things, is engaged in refining, receiving and shipping petroleum oils, naptha and other commodities, and for those purposes owns and operates a large refinery at Port Arthur, Texas.

2. Defendants, Texarkana & Fort Smith Railroad Company and Director General, are common carriers for hire by railroad, so engaged in transporting property between places in different states of the United States and so subject to the

provisions of said Act to Regulate Commerce, its supplements and amendments; and as the property of said defendant, Texarkana & Fort Smith Railroad Company, is now being operated in its behalf by the said Director General under said Federal Control Act; the said defendants and properties aforesaid are likewise subject to the provisions of said act, including Section 10, thereof.

3. Defendants, Texarkana & Fort Smith Railroad Company and the said Director General, at all times herein mentioned, have established and maintained with other connecting carriers by railroad, common arrangements for the continuous carriage of property wholly by their railroads, from Kiefer and elsewhere in the State of Oklahoma to Port Arthur, in the State of Texas, and with respect thereto through routes and joint rates have been established and the schedules and tariffs showing said joint rates have been duly published, posted and filed with the Interstate Commerce Commission of the United States by said common carriers, including the said defendant, as required by and in conformity with said Act to Regulate Commerce.

4. Among the joint rates so published and filed as aforesaid in force and effect at all the times herein mentioned, and at the time of the filing of this bill of complaint, is a rate covering the transportation over said route from Kiefer, Oklahoma, to Port Arthur, Texas, of unrefined naphtha in tank cars in carload lots, at twenty-four (24) cents per hundred (100) pounds.

5. Complainant, in the regular course of its business, for a long time past has been, it now is, and it intends to continue indefinitely, shipping, daily, large quantities of unrefined naphtha in carload lots from Kiefer, Oklahoma, to Port Arthur, Texas, over and by said route of said common carriers.

6. On or about July 7, 1919, while said rate of twenty-four (24) cents per hundred (100) pounds, so as aforesaid lawfully published and filed, was as aforesaid still in force and effect and the only lawful rate applicable thereto, said defendants, Texarkana and Fort Smith Railroad Company and the said Director General, by and through G. C. Weddell, their agent aforesaid, notified complainant that it would refuse longer to carry and deliver to complainant at Port Arthur its said carload lots of unrefined naphtha coming from Kiefer, Oklahoma, by said route at said rate of twenty-four (24) cents, nor unless the complainant would pay defendants' charges computed at a rate of thirty-seven and one-half ( $37\frac{1}{2}$ ) cents per hundred (100) pounds, notwithstanding defendants have at none of the times herein mentioned lawfully published and

filed with the Interstate Commerce Commission any such schedule naming a rate of thirty-seven and one-half ( $37\frac{1}{2}$ ) cents for such transportation, nor any other rate than said rate of twenty-four (24) cents applicable to said traffic; and, continuously since said date, said defendants have refused to deliver to complainant its carload lots of unrefined naphtha arriving at Port Arthur, consigned to it from Kiefer, Oklahoma, until complainant paid defendants' charges thereon computed at a rate of thirty-seven and one-half ( $37\frac{1}{2}$ ) cents per hundred pounds (100).

7. Since July 7, 1919, defendants have collected from complainant, as and for freight charges, upon the dates shown below and the cars numbered as shown, each containing the quantity in pounds set opposite thereto, the sums shown as charges being at the rate shown, to-wit:

From.	Date.	Car Number.	Pounds.	Charges Collected.	Rate Per Cwt.
Kiefer	7- 9-19	GPTX 309	52939	\$130.86	$37\frac{1}{2}c$

Kiefer	7-16-19	GPTX 402	52972	130.95	$37\frac{1}{2}c$
Kiefer	7-16-19	GPTX 336	52952	130.89	$37\frac{1}{2}c$
Kiefer	7-16-19	MV 8011	66112	163.43	$37\frac{1}{2}c$
Kiefer	7-16-19	MV 8023	66099	163.40	$37\frac{1}{2}c$
Kiefer	7-16-19	MV 8093	66152	163.52	$37\frac{1}{2}c$
Kiefer	7-16-19	MV 8067	66119	163.44	$37\frac{1}{2}c$

Complainant paid the foregoing charges under protest and under the coercion of the defendants' refusal to deliver same upon the tender of charges upon the basis of the lawful rate of twenty-four (24) cents per hundred (100) pounds.

8. On July . . . , 1919, there arrived at Port Arthur, Texas, over the aforesaid railroad route from Kiefer, Oklahoma, consigned to complainant, the following cars containing the quantities of unrefined naphtha set opposite the numbers thereof, to-wit:

			Weight in Pounds.
Car	GRCX	2440	53,341
Car	GPTX	457	52,952

Upon which complainant has tendered the defendants' charges computed at the lawful rate aforesaid of twenty-four (24) cents per hundred (100) pounds, and the defendants refused and still continue to refuse to deliver the same to complainant until and unless complainant shall pay charges computed at the rate of thirty-seven and one-half ( $37\frac{1}{2}$ ) cents per hundred (100) pounds.

9. Unless the defendants are restrained by this Honorable Court from doing so, they will continue to refuse to deliver the shipments of unrefined naphtha arriving at Port Arthur, as hereinbefore set forth, excepting upon the complainant paying freight charges computed at the rate of thirty-seven and one half ( $37\frac{1}{2}$ ) cents per hundred (100) pounds, being thirteen and one-half ( $13\frac{1}{2}$ ) cents per hundred pounds in excess of the rate lawfully published and filed as aforesaid, and the only redress which complainant will have in the premises is to institute suits at law to recover said overcharges, which will result in complainant's being compelled to bring a very large number of suits at law, so long as defendants continue in their intended course of attempting to exact charges computed at the rate of thirty-seven and one-half ( $37\frac{1}{2}$ ) cents per hundred (100) pounds.

10. Complainant's aforesaid consignments of unrefined naphtha move principally in cars furnished by complainant of which complainant has a number only sufficient to care for said traffic, if kept moving uninterruptedly, and if defendants are not prevented by order of this Honorable Court from so doing they will as they have threatened to do, hold up and refuse to deliver to complainant, although complainant is willing to pay the lawful rates and charges as aforesaid thereon, said cars so, as aforesaid, to be consigned to it; and as a consequence of this course of conduct on the part of defendants in demanding an unlawful rate greatly in excess of the lawful rate and in withholding complainant's cars and refusing to deliver same,

complainant will be compelled to discontinue part of its operations at great financial loss to it, which loss cannot be admeasured and recovered at law and hence is irreparable, and such loss has already begun, due to the withholding by defendants of the cars hereinbefore mentioned and will immediately continue to grow daily in proportion as such cars are withheld, and as long as said unlawful rates are demanded by defendants.

11. The course of said defendants in so collecting the charges in excess of those named in the tariffs so lawfully published and filed with the Interstate Commerce Commission as aforesaid, and in refusing to deliver to complainant its property until and unless such overcharges shall be paid, is contrary to the provisions of the Act to Regulate Commerce, and denies to this complainant the right provided by said Act to Regulate Commerce to have its property transported at no greater cost than that named in the schedules lawfully published and filed with the Interstate Commerce Commission.

Forasmuch, therefore, as complainant is remediless by the strict rules of the common law, and to the end therefore that complainant may have the relief which it can obtain in a court of equity only, and that the defendants may answer the premises aforesaid, but not upon oath or affirmation, both of which are expressly waived by it, the complainant now prays this honorable court to grant to it an interlocutory injunction, issuing out of and under the rules and practice of said court, to be directed to said defendants, Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads, and G. C. Weddell, their agent, restraining them and each of them, their successors, agents, servants, employees and assistants, from collecting or attempting to collect charges upon shipments of unrefined naphtha consigned from Kiefer, Oklahoma, to complainant at Port Arthur, Texas, in excess of the lawful rate of twenty-four (24) cents per hundred (100) pounds, so long as the same shall remain in force and effect, as provided by the Act to Regulate Commerce, and restraining them from refusing to deliver to complainant such consignments without the payment by complainant of charges computed at any rate in excess of said lawful rate, and that at the final hearing herein such injunction be made permanent; and that complainant may have such further and other relief in the premises as under the circumstances of the case may be required.

And as in duty bound complainant will ever pray.

Dated, 21st day of July, A. D. 1919.

Jno. E. Green, Jr.,  
Solicitor for Complainant.

Of Counsel—F. C. Proctor, Houston, Texas.

Frank M. Swacker, Wilkins Building, Washington, D. C.

The State of Texas, County of Harris:

John W. Tryon, of lawful age being first duly sworn upon oath states that he is manager at Port Arthur, Texas, for the Gulf Refining Company, the complainant in the above entitled bill; that he has read said bill and knows the contents thereof, and that the matters and things stated therein as facts are true, and that the matters stated upon belief he verily believes to be true.

John W. Tryon.

In the District Court of the United States for the Eastern District of Texas. Gulf Refining Company, Complainant, against Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads, and G. C. Weddell, Defendants.—No. 212, in Equity.

#### AMENDMENT TO BILL OF COMPLAINT.

To the Honorable Judges of the District Court of the United States, for the Eastern District of Texas, sitting in equity:

Comes now the complainant, Gulf Refining Company, and, upon leave first had and obtained from this Honorable Court, files this Amendment to its Bill of Complaint herein and amends Paragraph 5 of its complaint herein filed to read as follows:

5. Complainant, in the regular course of its business for a long time past, it is now, and it intends to continue indefinitely, shipping daily large quantities of unrefined naptha in earload lots from Kiefer, Oklahoma, to Port Arthur, Texas, over and by said route of said common carrier; said shipments for more than a year last past have averaged approximately seven earloads per day, and complainant intends to ship daily an equally large number of earloads of said unrefined naptha in the future.

And in addition to the relief prayed in the original bill herein, complainant prays upon final hearing herein that the court find and decree that the shipments set forth in Paragraph 7 of the Bill of Complaint in fact consisted in unrefined naptha; that the legal rate thereon was twenty-four (24) cents per hundred pounds, and that the defendant unlawfully im-

posed upon and collected from complainant charges computed at the rate of thirty-seven and one-half ( $37\frac{1}{2}$ ) cents; and that defendants be required to repay to complainant the excess so as aforesaid collected by them from complainant with respect to said shipments; and that the court further find and decree that the two cars set forth in paragraph 8 of the Bill of Complaint contained unrefined naphtha, and that the legal rate thereon was 24 cents per hundred pounds.

And as in duty bound complainant will ever pray.

Dated this 24th day of July in the year of our Lord, 1919.

Jno. E. Green, Jr.,

Solicitor for Complainant.

Of Counsel—F. C. Proctor, Houston, Texas.

**Defendant's Exhibit 144.**

In the District Court of the United States for the Eastern District of Texas. Gulf Refining Company, Complainant, against Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads, and G. C. Weddell, Defendants.—No. 212, in Equity.

This case came on to be heard on bill and answer and motion of the complainant for an injunction pendente lite, and on motion of the defendants to dismiss the bill, and was argued by counsel, Mr. John E. Green, Jr., and Mr. Frank M.

Swacker, for complainant, and Mr. J. M. Souby and Mr. Y. D. Carroll for defendants, and upon consideration of the verified bill, the amendments thereto and the affidavit of O. E. Abel, the answer and the aforesaid motions; it is now

Ordered that the motion to dismiss be and it hereby is overruled; and it is further

Ordered that the defendants and each of them, Walker D. Hines, Director General of Railroads of the United States, Texarkana and Fort Smith Railroad Company and G. C. Weddell, their officers, agents, assistants, and employees, and all persons serving under them, be, and they are hereby enjoined until further order of this court from refusing to transport and deliver to complainant, Gulf Refining Company, shipments described by said complainant as unrefined naphtha moving from Kiefer and elsewhere in the State of Oklahoma to Port Arthur, in the State of Texas, upon the tender or payment to said defendants by said complainant of freight charges thereon at the rates lawfully published and filed with the Interstate Commerce Commission applicable to shipments of unrefined naphtha in carload lots (said rate at the present time being twenty-four (24) cents per hundred (100) pounds); and said defendants, their officers, agents, assistants and employees, and all persons serving under them, are further enjoined, until further order of this court, from attempting to collect from said complainant upon shipments in carload lots moving over the lines of railroad under their control, and those connected therewith from Kiefer and elsewhere in the State of Oklahoma to Port Arthur, in the State of Texas, described by said complainant as unrefined naphtha, charges upon rates in excess of those lawfully published and filed with the Interstate Commerce Commission of the United States as applicable to unrefined naphtha; Provided, that complainant, Gulf Refining Company give bond to defendants in the sum of Thirty Thousand (\$30,000.00) Dollars, conditioned that said complainant will abide the decision which may be made herein, and pay all sums of money and costs that may be adjudged against it, if this injunction be dissolved in whole or in part; And it is Further Ordered that defendants have leave to apply to this court at any time to increase said bond upon a showing of its insufficiency.

Ordered that a copy of this decree be served upon said defendants.

Entered this 26th day of July, A. D. 1919.

**Defendant's Exhibit 145.**

In the District Court of the United States, for the Eastern District of Texas. Gulf Refining Company, Complainant, against Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads, and G. C. Weddell, Defendants.—No. 212, in Equity.

State of Texas, County of Harris:

Overton E. Abel, of lawful age, being first duly sworn, upon oath deposes and says:

That I am, and for several years last past have been, employed by the Gulf Refining Company, the complainant in this proceeding, having been during the last three years, and am at present, Assistant Superintendent of its plant at Port Arthur, Texas; as such Assistant Superintendent I am in charge of the outside works and distillation at said plant; and it is a part of my duty to receive and examine and dispose of the cars of unrefined naphtha received by the Gulf Refining Company at Port Arthur, Texas, coming from Kiefer, Oklahoma, and other places in Oklahoma, over the line of railroad of the Texarkana & Fort Smith Railroad Company; and it is also a part of my duty to know and understand the various grades of naphtha and petroleum products; that all of the shipments billed as unrefined naphtha received at Port Arthur, Texas, for more than a year last past coming from Kiefer and elsewhere in Oklahoma over the Texarkana & Fort Smith Railroad, those mentioned in the bill of complaint in this cause, including the two cars now held by the railway company, as set forth in the petition of the complainant, described upon such shipments as containing unrefined naphtha, are, in fact, unrefined naphtha, and not gasoline or any other commodity; that said shipments of unrefined naphtha have during that time averaged seven carloads per day, and that the Gulf Refining Company intends to continue shipping daily an equally large number of carloads of said commodity in the future; that the term "unrefined naphtha" has been, is, and will be, applied as a shipping description with respect only to shipments in fact consisting of unrefined naphtha; that all of the shipments coming to the plant at Port Arthur described as unrefined naphtha

are the same commodity as that contained in the two cars described in the complaint as being held by the carrier; that the detention of the two cars by the carrier set forth in the complaint is already causing substantial interference with complainant's business in that it interferes with the regularity of the movement of unrefined naphtha resulting in financial loss to complainant, and that the continued detention by the carrier of the cars, daily arriving, consigned to complainant will ultimately compel it to shut down parts of its operations at very substantial loss to it, the exact amount of which, however, it is practically impossible to determine because of losses which will result indirectly therefrom.

Overton E. Abel.

#### **Defendant's Exhibit 146.**

In the District Court of the United States for the Eastern District of Texas. Gulf Refining Company, Complainant, vs. Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads and G. C. Weddell, Defendants—In Equity, No. 212.

#### **DEMURRER AND ANSWER.**

To the Honorable Judges of the District Court of the United States for the Eastern District of Texas, sitting in Equity:

Now come the above named defendants and demur to the bill of complaint filed by complainant in this cause, for the reason that said bill does not state facts sufficient to confer jurisdiction upon this court as a court of equity to entertain said complaint. Wherefore, defendants pray that said bill be dismissed.

Subject to the foregoing demurrer and without waiving same, for their answer to the complaint filed herein, defendants state:

I.

These defendants admit the allegations contained in the first paragraph of said complaint.

II.

These defendants deny that the amount in controversy herein, exclusive of interests and costs, equals the sum or value of \$3000.00 and likewise deny that the refusal of this court to grant the relief prayed for by complainant herein will occasion immediate and irreparable loss and damage to the complainant, or will result in a multiplicity of suits at law.

These defendants are without information as to the allegations contained in the first section of paragraph third of the complaint and ask for proof thereof.

These defendants admit the allegations contained in sections two, three and four of said paragraph third of the complaint.

These defendants deny that complainant has been in the past, is now, or intends to continue shipping unrefined naphtha in any quantities from Kiefer, Oklahoma, to Port Arthur, Texas, as alleged in section five of said paragraph third of the complaint, but on the contrary defendants allege, according to their information and belief, that such shipments referred to in said section consist of gasoline.

In answer to section six of said paragraph third of the complaint, defendants state that while there was in effect as alleged by complainant a rate of 24 cents per hundred pounds applicable between the points in question on unrefined or unfinished naphtha, there was and is concurrently in effect a rate of 37½ cents per hundred pounds applicable between said points on gasoline and that in accordance with their information and belief defendants have, since July 7, 1919, asked and demanded of complainant for the transportation of the commodity tendered by complainant for transportation in carload lots from Kiefer, Oklahoma, to Port Arthur Texas, a rate of 37½ cents per hundred pounds, which is the rate lawfully applicable to such transportation on gasoline.

Defendants are not informed as to the shipments alleged by complainant to have been made in section seven of paragraph third and, therefore, ask for proof thereof.

Defendants are informed that the two carload shipments referred to in section eight of said paragraph third contained gasoline and not unrefined naphtha and furthermore that same were transported from Glenn Pool, Okla., instead of Kiefer, Okla., as alleged in said section. Defendants admit, however,

that they did refuse to deliver the two carload shipments in question to complainant until and unless complainant should pay freight charges thereon computed at the rate lawfully applicable on gasoline moving between said points in carload lots.

In answer to the allegations contained in section nine of said paragraph third, these defendants state that so long as they continue to believe that shipments of the commodity in controversy herein made by complainant between the points in question consist of gasoline, they will continue to demand of complainant upon the delivery thereof at destination, the rate lawfully applicable on gasoline; but defendants deny that complainant does not or will not have full and adequate remedies at law for any and all damages which it may suffer as a result of defendants' actions in the premises.

Defendants allege that any holding up or delaying of cars such as is referred to in section ten of paragraph third of the complaint will be due wholly to the action of complainant in refusing to accept shipments which may be tendered it for delivery by defendants and to pay the charges assessed thereon by defendants and will not be due to any action upon the part of these defendants against which complainant is entitled to relief in equity at the hands of this court.

Defendants deny the allegations contained in section eleven of said paragraph third, but state on the contrary that they are undertaking to comply with the provisions of the Act to Regulate Commerce by assessing and collecting for the transportation of the shipments in question the rate lawfully applicable thereon.

Wherefore, having answered, these defendants pray that said complaint may be dismissed.

The President of the United States of America—Greeting.

To the defendant, Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads and G. C. Weddell:

You are hereby commanded to appear before the Honorable J. C. Hutcheson, Jr., the duly designated and acting United States District Judge for the Eastern District of Texas, at the Federal Building, at Houston, Texas, on the 24th day of July, A. D. 1919, at 10 o'clock A. M., and show cause, if any there be, why a preliminary injunction should not issue

restraining the Texarkana and Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads, and G. C. Weddell, agent of said Railroad and of said Director General from attempting to collect upon shipments of unrefined naphtha consigned from Kiefer, Oklahoma, to the Gulf Refining Company at Port Arthur, Texas, charges in excess of the lawful rate of twenty-four (24) cents per hundred (100) pounds, and from refusing to deliver said Gulf Refining Company's cars when the lawful rate of twenty-four (24) cents is tendered.

Witness the Honorable J. C. Hutcheson, Jr., District Judge of said Court this the 21st day of July, in the year of our Lord One Thousand Nine Hundred and Nineteen, and of our Independence, One Hundred and Forty-three.

**Defendant's Exhibit 148.**

In the District Court of the United States for the Eastern District of Texas. Gulf Refining Company, Complainant, against Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads, and G. C. Weddell, Defendants.—No. 212, in Equity.

Whereas, the Gulf Refining Company plaintiff, in the above styled cause pending in the said court, has this day sued out in said court an injunction to restrain Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads, and G. C. Weddell, defendants in said suit, from refusing to transport and deliver certain shipments at freight rates lawfully applicable thereto and from attempting to collect charges thereon in excess of those lawfully applicable as described in the petition for injunction.

Now therefore, know all men by these presents, that we, the Gulf Refining Company, as PRINCIPAL, and American Surety Company of New York, as SURETY, do hereby acknowledge ourselves bound to pay to Texarkana & Fort Smith Railroad Company, and Walker D. Hines, Director General of Railroads, and G. C. Weddell the sum of Thirty Thousand (\$30,000) Dollars, conditioned that the Gulf Refining Company, plaintiff in said suit, will abide the decision which may be made therein, and pay all sums of money and costs that may be adjudged against it, if the injunction granted in said suit be dissolved in whole or in part.

Witness our hands this the 26 day of July, A. D. 1919.

Gulf Refining Company Principal.

American Surety Company of New York,  
Surety.

By J. W. Tucker, Attorney in fact.

Countersigned By Sterling Myer, Atty.

July 26, 19.

Approved and ordered filed.

Jos. C. Hutcheson, Jr., Judge.

(Endorsed) Eq. No. 212. Gulf Refining Co. vs. Texarkana & Ft. Smith Railroad Co. et al. Bond of Gulf Refining Co. Filed Jul. 26, 1919, J. R. Blades, Clerk, by H. C. Blades, Deputy.

---

United States of America, Fifth Circuit, Eastern District of Texas—ss.

I, J. R. Blades, Clerk of the District Court of the United States for the Eastern District of Texas, do hereby certify

the foregoing to be a true and correct copy of the Bond of Gulf Refining Company, in cause No. 212, on the Equity Docket of said Court, entitled Gulf Refining Company vs. Texarkana & Fort Smith Railroad Company and Walker D. Hines, Director General of Railroads, and G. C. Weddell, as fully as the same now appears on file in my office at Beaumont.

To certify which, witness my official hand and the seal of said court at Beaumont, in said District this the 5th day of April, A. D. 1920.

(Seal)

J. R. Blades,  
Clerk U. S. District Court, E. D. T.

United States of America, Eastern District of Texas.

I, W. L. Estes, United States District Judge for the Eastern District of Texas, do hereby certify that J. R. Blades whose genuine signature appears signed to the foregoing certificate was, at the time of signing same, and is now, Clerk of the District Court of the United States for the Eastern District of Texas and that his official acts as such are entitled to full faith and credit.

I further certify that said alteration is in due form.

Given under my hand at Beaumont Texas, this 5th day of April, A. D. 1920.

(Signed)

W. L. Estes,  
U. S. District Judge for the E. D. T.

United States District Court Eastern District of Texas.

I, J. R. Blades, Clerk of the District Court of the United States for the Eastern District of Texas do hereby certify, that the Honorable W. L. Estes whose name appears signed to the foregoing certificate, was at the time of signing same, and is now, the Judge of the United States District Court for the Eastern District of Texas, and that his said signature is genuine.

To certify which, witness my hand and seal of the said Court at Beaumont, Texas, this 5th day of April, A. D. 1920.

(Seal)

(Signed) J. R. Blades,  
Clerk U. S. District Court, Eastern District of Texas.

# RECOVERY OF GASOLINE FROM NATURAL GAS BY COMPRESSION AND REFRIGERATION

BY

W. P. DYKEMA

WASHINGTON  
GOVERNMENT PRINTING OFFICE  
1918

The Bureau of Mines, in carrying out one of the provisions of its organic act—to disseminate information concerning investigations made—prints a limited free edition of each of its publications.

When this edition is exhausted, copies may be obtained at cost price only through the Superintendent of Documents, Government Printing Office, Washington, D. C.

The Superintendent of Documents *is not an official of the Bureau of Mines*. His is an entirely separate office and he should be addressed:

SUPERINTENDENT OF DOCUMENTS,  
*Government Printing Office,  
Washington, D. C.*

The general law under which publications are distributed prohibits the giving of more than one copy of a publication to one person. The price of this publication is 25 cents.

II

*First edition. April, 1918.*

# RECOVERY OF GASOLINE FROM NATURAL GAS BY COMPRESSION AND REFRIGERATION.

---

By W. P. DYKEMA.

---

## INTRODUCTION.

In investigating the general problems that relate to the petroleum industry in the United States, the Bureau of Mines has given considerable attention to the recovery of motor fuel from natural gas. Recent developments in gasoline power units and their increasing use have made it imperative that all fractions of petroleum suitable for fuel in this type of engine be conserved. The bureau has issued a number of publications on this subject. Among these are Technical Paper 10, "Liquefield products of natural gas, their properties and uses"; Bulletin 42, "The sampling and examination of mine gases and natural gas"; Technical Paper 87, "Methods of testing natural gas for gasoline content"; Bulletin 120, "Extraction of gasoline from natural gas by the absorption method"; and Bulletin 88, "The condensation of gasoline from natural gas."

This report treats of the compression and refrigeration process for the recovery of gasoline from natural gas from the viewpoint of the practical engineer and business man. Conditions of actual operation and the equipment in use are cited and described so that operators, and others interested, can compare the variations in methods of treating natural gas for its gasoline content in the different fields and also the conditions encountered and the features that control the methods used.

## ACKNOWLEDGMENTS.

The writer heartily acknowledges the valuable assistance and cooperation of the many plant operators and gasoline producers who have cheerfully furnished data on their plants and granted the privilege of plant inspection.

Particular thanks are due to Messrs. W. R. Hamilton, G. L. Goodwin, and D. L. Newton for the many courtesies extended the writer and for much of the information regarding cooling by expanded gas as practiced in the California fields.

Thanks are also due Messrs. W. P. Donovan, Thomas Chestnut, J. C. Gillespie, A. W. Peake, and R. E. Downing for valuable information on practices in the Mid-Continent fields.

## HISTORY OF THE INDUSTRY.

The early history of the manufacture of natural-gas gasoline has been published by the Bureau of Mines <sup>a</sup> in previous papers on the subject. The present practice is the result of the advance developed by a study of the needs of the industry, by improvements in machinery and equipment, and by a better understanding of the thermodynamic and other physical principles involved. A very small proportion of the plants erected have been commercial failures, and most of those which have failed lacked capital to carry them over a period of low prices for gasoline. Many of these plants are still operating the company having been reorganized or bought up by larger corporations, and under present market conditions they show satisfactory returns.

The following table shows the distribution of casing-head gasoline plants and the amount and value of the gasoline produced in the United States in 1915:

## **FACTORS TO BE CONSIDERED IN EXAMINING FIELD FROM WHICH GAS IS TO BE TAKEN.**

Before a compression plant can be properly designed to treat natural gas from any given area, a thorough study of the history of the field in general and especially of the sand from which the gas is to be taken should be made, also complete testing to determine the volume and gasoline content of the gas from the area under consideration should be made. This precaution is particularly necessary for a field in which there are no plants in operation that can be studied and used as a precedent.

A knowledge of the history of the field is important in determining the probable life of the wells and the decline in volume of gas produced from year to year. A plant built in California to treat 2,000,000 cubic feet per day has been able to get only half that amount because of the decline in gas production from the wells after the initial rock pressure was relieved, and new wells drilled for oil on the same lease have not thus far brought the quantity of gas up to the plant capacity. Gas from adjoining leases could not be obtained for treatment, and the plant at the time of the writer's visit was running at half capacity, as stated.

In all gas and oil fields in the United States it is found that as the pressure in the wells decreases the gas becomes richer in gasoline content. It is doubtful, however, if the actual total quantity of gasoline vapor from a given well increases, but it seems to be a fact that the amount of gasoline vapors produced declines much less rapidly than either the oil or gas production from a given well or area. This has been found to be practically true of West Virginia and California wells as long as the wells produce oil either under rock pressure or vacuum. In Pennsylvania a small compression plant is treating gas from wells that have long ceased to produce oil and are pumping salt water under vacuums of 26 inches of mercury.

New oil wells producing many million feet of gas under high rock pressure, such as are often brought in, in the Mid-Continent and California fields, are not considered, because gas produced under these conditions of pressure and volume practically never finds its way to compression plants. The gas produced under rock pressures of 400 to 1,500 pounds per square inch contains only comparatively small proportions of the heavier gasoline fractions and comparatively large quantities of the lighter or "wild" fractions, as would be expected from the condition under which the gas is held while in contact with the oil from which it must receive its charge of condensable vapors.

### **CHARACTER OF THE SAND.**

A knowledge of the sand from which the gas is to be produced is a valuable factor in designing a plant; the thickness, texture, or degree of cementation bear directly on the future of the field as a

gas and gasoline producer. Thick sand of close texture indicates long life as an oil producer, and consequently a long life for gasoline production. Loose, uncemented sands, such as are found in California, will not withstand the suction of vacuum pumps, which causes the sand to come in and stop or injure the pumps. This inflow of sand reduces the production of oil and increases the expense of cleaning the wells, so that companies treating their own gas do not permit the vacuums held on walls to exceed 1 to 2 inches of mercury at the casing head. This limitation of vacuums may react in such a way as to make compression plants unprofitable when the oil production has become small and the rock pressure has been completely relieved.

#### CHARACTER OF THE OIL.

Casing-head gas produced with high-gravity oil is almost universally rich in gasoline vapors, except when the gas is produced under extremely high pressures. However, the fact that an oil is of low gravity can not always be depended on to indicate small gasoline content, as has been shown by compression practice in California. As a rule, in California, casing-head gas produced with oil having a gravity of less than 22° B. does not yield enough gasoline for profitable compression. However, in the Salt Lake field, the oil has a gravity of 15° to 17° B. and still the casing-head gas is commercially valuable for its gasoline content. Analyses by the Bureau of Mines<sup>a</sup> of oil from this field shows that it carries exceptionally high proportions of asphaltum (55.3 per cent), but also carries lighter products, ranging up to fractions distilling over at 150° to 200° C., to which are due the gasoline vapors in the gas. The Kern River field, yielding oil with an average gravity of 14° B. has not, so far, produced any gas that is being treated for gasoline.

#### WATER SUPPLY.

Water being essential in all plants making gasoline by compression methods, the supply and the quality of water available should be carefully determined. The cooling coils and the compressor jackets of a plant treating 1,000,000 cubic feet of gas daily at a pressure of 250 pounds per square inch will use 100 to 300 barrels of water a day, depending on the design of the water-cooling system and the temperatures obtained. The loss is accounted for by the evaporation and, in plants where towers or sprays over ponds are used, by water being carried away by the wind. In the oil fields much of the water is so heavily charged with mineral salts as to be almost useless for boilers, gas-engine jackets, and compressor jackets. Such water to be made fit for boiler use must be treated with a so-called "boiler

<sup>a</sup> Allen, I. C., Crossfield, A. S., Jacobs, W. A., and Matthews, R. R., Physical and chemical properties of the petroleum of California: Tech. Paper 74, Bureau of Mines, 1914, p. 13.

compound." For cooling jackets of machines the water must be condensed, otherwise it forms a scale, which interrupts the circulation of water and is dangerous both to machinery and to the operators, and also cuts down the efficiency of the engine and compressor by permitting overheating of the cylinders and of the gas being treated.

#### TRANSPORTATION FACILITIES.

The matter of transportation is of importance, as on it depends, in part, the questions of blending, size and weight of units, plant location, and length of pipe lines. Before a plant is designed, the most economical product should be determined, as it may be that producing the maximum quantity of condensate possible from a given gas will be as profitable as a smaller quantity of a less volatile product. Producing the maximum quantity of condensate from a gas requires high pressures and blending with naphtha as soon as possible after the condensate is precipitated. This requires machines to produce the high pressure, which adds to the cost of installation, and a continual supply of naphtha for blending. If the cost of freight on the naphtha coming to the plant and on the percentage of naphtha in the blended product going back to market, plus the cost of mixing and of losses in blending and handling, is greater than the value of the condensate produced in excess of the quantity that could be produced at a lower pressure without blending, it would be more profitable to produce less condensate of lower vapor tension capable of being shipped as made. For example, a plant in the Mid-Continent field, situated an excessive distance from the nearest refinery from which it could obtain naphtha for blending, finds that using a pressure of 80 pounds from single-stage compressors, and producing 1.8 gallons of condensate with a gravity of 75° to 80° B. and a vapor tension of 5 to 6 pounds, is more profitable than producing 3 gallons of condensate having a gravity of 94° to 98° B. and blending it at or near the plant.

The distance from a railroad will also have a bearing on the cost of erecting a plant. Pipe lines are usually built from the plant to loading racks or blending stations on the railroad. More recent practice seems to favor blending at the compression plant, which necessitates pumping the naphtha to the plant and pumping the blended product back to the loading station through pipe lines. The greatest expense from being at a distance from a railroad, however, is that of hauling equipment and repairs. Machines built in parts too large to handle on the wagons or trucks usually found in oil fields are much more expensive to place than machines shipped in smaller parts. Roads, distances, and the weights of large parts of machines should be considered when a plant is being designed or an estimate of cost figured.

Plate I, A (p. 24), shows two single castings weighing 31,000 pounds each, which were placed in a plant that could be reached only by narrow, steep roads. The trouble and expense of hauling such parts is a factor in plant construction.

The general topography at one compression plant is shown in Plate II, A (p. 24).

#### DISTRIBUTION OF WELLS.

If the wells from which gas is to be taken are distributed over a wide area, it is well to consider the construction of two or more smaller plants rather than one larger plant. One plant visited by the writer treats gas collected over an area of approximately 32 square miles. The extensive pipe-line system required to bring the gas to the plant and return it to the various leases, with the booster stations and equipment necessary to maintain them, makes this plant, in the opinion of the management, more expensive and less efficient than two or three smaller plants would have been.

#### CONDITION OF WELLS.

Before erecting a compression plant in an old field the condition of the casings in the wells from which gas is to be taken should be ascertained. In an old field in Pennsylvania it was found that the casings were badly rusted and allowed excessive quantities of air to enter the lines as soon as a vacuum of more than 1 or 2 inches was placed on them. The wells made an average production of only 1,000 cubic feet of gas a day, so that the expense of recasing would not seem to be warranted.

J. O. Lewis, petroleum technologist of the Bureau of Mines, states that air is often admitted to wells in which the casing has not been properly placed, the air entering through porous strata from other wells which are not being held under vacuums.

#### TESTING NATURAL GAS.

The testing, measuring, and sampling of natural gas for its gasoline content has been described in Bureau of Mines publications<sup>a</sup> by G. A. Burrell and his associates, and will only be taken up briefly by the writer.

Many compression plants are successfully treating gas about which few facts were known before the plant was erected. Much time and expense could have been saved, however, if more had been learned of the physical and chemical characteristics of the gas before the plans

<sup>a</sup> Burrell, G. A., and Jones, G. W., Methods of testing natural gas for gasoline content: Tech. Paper 87, 1916, 23 pp. Burrell, G. A., Seibert, F. M., and Robertson, I. W.: Analysis of natural gas and illuminating gas by fractional distillation at low temperatures and pressures: Tech. Paper 104, 1915, 41 pp. Burrell, G. A., Seibert, F. M., and Oberfell, G. G., The condensation of gasoline from natural gas: Bull. 80, 1915, 106 pp.

of the plant were made and the machinery installed. The investment in a compression plant is large enough to warrant the expense of having all necessary tests, analyses, and measurements of gas made and checked before the plans and details of construction are taken up.

#### SPECIFIC GRAVITY TEST.

Natural gas having a specific gravity of 0.78 (air = 1) and higher is being successfully treated in compression plants. The specific gravity test is useful as an indicator, but the possibility of misleading variations through the presence of other gases, such as air, carbon dioxide, nitrogen and sulphur compounds, in the sample makes this test unreliable if used alone. If an analysis is made of the gas and the specific gravity of the hydrocarbon contents computed, the results are more dependable, but even then are not reliable enough to be used as a basis for final decisions regarding plant construction.

#### SOLUBILITY TEST.

The solubility test described by Burrell and Jones<sup>a</sup> is useful as an arbitrary test, because it is known that gases of a solubility of less than 30 per cent have not been successfully treated in compression plants.

In regard to the following table they state that "in all cases the yield represents the actual amount of gasoline sold after weathering."

*Yield of gasoline from casing-head natural gas by compression method, corresponding to absorption and specific-gravity tests.<sup>a</sup>*

Absorption by oil.	Specific gravity (air=1).	Yield of gasoline, gallons per 1,000 cubic feet of gas.	Absorption by oil.	Specific gravity (air=1).	Yield of gasoline, gallons per 1,000 cubic feet of gas.

<sup>a</sup> Burrell, G. A., and Jones, G. W., work cited, p. 10.

It should be stated that both the specific-gravity test and the oil-absorption test fail when applied to residual gas from a gasoline plant because, although the results obtained will indicate high specific gravity and oil absorption, principally because of the presence of large percentages of the hydrocarbon gases, ethane and propane, yet the plant will have extracted the vapors of the liquid paraffins that constitute gasoline.

<sup>a</sup> Burrell, G. A., and Jones, G. W., *Methods of testing natural gas for gasoline content*: Tech. Paper 87, Bureau of Mines, 1916, pp. 7-10.

## FRACTIONAL DISTILLATION.

The Bureau of Mines<sup>a</sup> has developed a technical laboratory test based on a method of freezing out the propane and higher hydrocarbon fractions, which accurately determines the percentage of condensable hydrocarbons, including propane and all other higher members of the hydrocarbon series. This test can be made only in a well-equipped laboratory by experienced gas analysts.

Another method, based on the principle of low temperatures, that was originated by the Smith Emery Co., of Los Angeles, Cal., is essentially as follows: Gas from the casing-head of the well is led through a service meter (see fig. 1) under a pressure of 12 inches of water (devised so as to blow out if that pressure is exceeded) to a copper tube three-fourths of an inch in diameter and 15 feet long, coiled so as to fit into an asbestos insulated container 18 inches deep and 12 inches square. The container is filled with acetone (product of wood distillation) to within 2 or 3 inches of the top. Carbon dioxide snow from steel bottles of carbon dioxide in the liquid state is added to the acetone until a saturated solution is obtained. Complete saturation of the solution is shown when a portion of the snow remains, as snow, on the bottom of the container. The temperature of the acetone is held constant at 70° F. below zero by the carbon dioxide used in this way. Gas is passed through the copper coil, submerged in the acetone bath, until 500 or 1,000 cubic feet, as shown by the meter, has been treated; the coil is then drained into a flask, the quantity of condensate measured, and the gravity tested. If the condensate obtained in this manner is higher in gravity and vapor tension than would be desirable as a plant product, the condensate can be weathered down to the desired product, thus indicating the quantity of condensate of desired gravity which the gas contains. One series of tests made in this manner produced a condensate having a gravity of 90° B., and an absorption plant treating the gas reports a production approximately equal to the results obtained in the original tests of the gas. It requires 2 or 3 bottles of carbon dioxide to conduct this method of testing for one day, and the gas from 6 to 10 wells can be tested in that length of time.

## PORTABLE COMPRESSOR TEST.

It has become the practice, in testing natural gas for its gasoline content to determine its suitability for use in a compression plant, to make actual physical tests with a small portable plant consisting of a compressor, meter, and cooling coils mounted on a wagon or

<sup>a</sup> Burrell, G. A., Seibert, F. M., and Robertson, I. W., Analysis of natural gas and illuminating gas by fractional distillation in a vacuum at low temperatures and pressures: Tech. Paper 104, Bureau of Mines, 1915, 41 pp.

truck. Each well is tested by moving the compressor outfit to a point where gas can be taken from the casing head or from the gas line leading from the well.

The reason for testing each well separately is that even in the same field gas from different wells has widely varying contents of gasoline vapor, and if comparatively dry gas is mixed with gas of greater vapor content, the yield of condensate will be decreased or greater pressure and a lower temperature will be required to precipitate an equal quantity. This point was proved in practice by a plant in California, which, by turning out of its lines the gas from a well making about one-half million cubic feet per day, increased the plant production, no change being made in the pressure or the cooling system.

A portable testing outfit observed in operation by the writer consisted of a tank 12 by 36 inches used as a gas receiver, a 4-horsepower gas engine belted to a 3 by 3½ inch single-acting compressor with a capacity of 3 cubic feet per minute, a single coil of 1-inch pipe of the continuous, return-bend type cooled by submerging in a wooden trough of water and ice, and a double coil, 12 feet long, of 1-inch pipe inside a 2-inch pipe, cooled by expanding the compressed gas through a valve connection between the outside and inside pipes.

FIGURE 1.—Apparatus for testing natural gas by the acetone and carbon-dioxide method.

The gas was brought from the well line through a  $\frac{1}{2}$ -inch pipe fitted with a water gage for regulating the pressure on the intake receiver; this receiver also served as a trap for heavy oil and dirt. From the receiver the gas was compressed and delivered to the water-cooled coil at a pressure of 250 pounds, the water being cooled with ice. Ice was used because it gave lower and easily regulated temperatures, was more convenient to obtain than a large or continuous supply of fresh cold water, and permitted tests to be run at nearly the same temperature and under more uniform conditions. The gas from the water-cooled coil discharged into the chamber between the outer and the inner pipe of the double coil. At the discharge end of the outer or 2-inch pipe was suspended a 1-inch drip pipe to collect the condensate. Gas from the 2-inch pipe was expanded through the valve into the inner pipe to refrigerate the high-pressure gas flowing through the outside pipe and discharged through a service meter to the atmosphere. Records were kept of temperatures, pressures, and amounts and gravity of condensate produced. The tests were made at night to aid cooling. From time to time specific-gravity tests of gas from individual wells were made and recorded. When the gas from any well dropped noticeably in gravity, a compression test was run on it, and, if found too low in gasoline content for profitable recovery, was turned into the fuel lines of the lease and was not treated.

#### SOURCES OF ERROR IN PORTABLE COMPRESSOR TESTS.

The greatest source of error in making tests with portable outfits is the meters. Service or domestic meters become inaccurate if operated at pressures above those for which they were made, and should be tested before use even at normal pressures, and during use should be protected from excessive pressures by a water or mercury pressure gage placed on the pipe ahead of the meter intake. Pressures of 8 to 12 inches of water are usually used with meters of this type. Some operators use two meters, one on the intake and one on the discharge of the portable tester, the indicated amounts of gas being averaged in calculating the production.

Results are apt to be misleading when gas being treated in the testing machine is not cooled to the same temperature as under plant conditions or compressed to the pressure used in the plant. Small portable testing compressors can be adjusted and operated under conditions so nearly simulating actual plant conditions as to give reliable data on which to base estimates of pressures, temperatures, and recovery.

## MEASURING THE FLOW OF NATURAL GAS.

The following description of the orifice-meter method of gas measurement is from Technical Paper 87<sup>a</sup> of the Bureau of Mines:

## ORIFICE METER.

An instrument known as the orifice meter, for testing small flows of natural gas, is shown in figure 2. This instrument is simple in construction, consisting of a short 2-inch nipple, *b*, with pipe thread on one end and a thin plate disk on the other. The disk carried a 1-inch orifice, *a*, and a hose connection, *c*, for taking the pressure. The meter is especially intended for testing small gas wells and "casing-head" gas from oil wells. As a rule the flow of gas from an oil well is rather small, and it is not advisable to test the flow with a Pitot tube such as is used in testing large gas wells. In using the orifice tester it is necessary to know the specific gravity of the gas in order to obtain the flow.

Before the orifice well tester is attached to the casing head the well should be permitted to blow into the atmosphere until the head of the gas is reduced and the flow has become normal. Then the tester is attached by simply screwing it into the end of a 3-foot length of 2-inch pipe and the pressure is read in inches of water on the siphon gage, *d*. In the table<sup>b</sup> the flow of the well, with values for gas of different gravities, is opposite the gage reading. The orifice in the instrument should be kept dry and uninjured; otherwise the gage reading will not be correct.

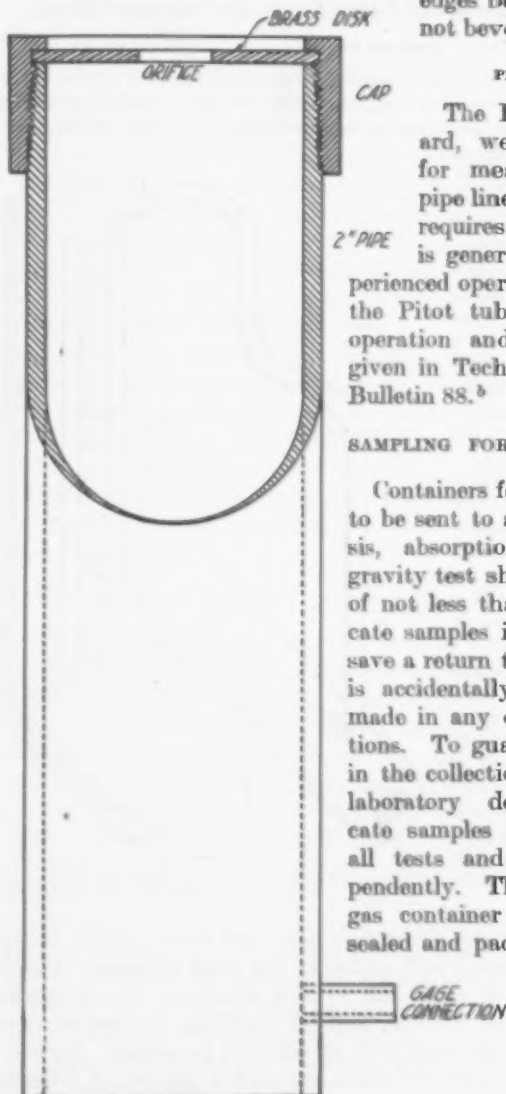

FIGURE 2.—Orifice meter for testing small flows of natural gas.

Beside the thin 1-inch orifice plate described above, orifice meters of this type are equipped with plates of the same thickness ( $\frac{1}{8}$  inch) and with orifices of  $\frac{3}{8}$ ,  $\frac{1}{2}$ ,  $\frac{3}{4}$ , and  $1\frac{1}{4}$  inch diameters for measuring flows of greater or less volume, and for checking, by two or more tests, the flow from the same well at different pressures. Figure 3 shows the design of meters in which are used a number of different sized orifice plates. The brass disks containing the orifices are carefully machined to a thickness of  $\frac{1}{8}$  inch and are made to fit perfectly

<sup>a</sup> Burrell, G. A., and Jones, G. W., Methods of testing natural gas for gasoline content: Bureau of Mines, 1916, pp. 18-20.

<sup>b</sup> See Table 15, p. 115.

between the cap which holds the disk in place and the end of the 2-inch pipe. The orifice in the disk is accurately drilled to size, the edges being made square and not beveled.

#### PITOT-TUBE METHOD.

The Pitot tube is a standard, well-known instrument for measuring gas flows in pipe lines and at gas wells; it requires careful attention and is generally used only by experienced operators. Descriptions of the Pitot tube and its method of operation and tables of flow are given in Technical Paper 87<sup>a</sup> and Bulletin 88.<sup>b</sup>

#### SAMPLING FOR LABORATORY TESTS.

Containers for natural-gas samples to be sent to a laboratory for analysis, absorption test, and specific gravity test should have a capacity of not less than 1 pint, and duplicate samples in two containers may save a return to the field if a sample is accidentally lost or an error is made in any one of the determinations. To guard against errors both in the collection of samples and in laboratory determinations, duplicate samples are often taken and all tests and analyses run independently. The bottle or other gas container should be carefully sealed and packed to avoid leakage from poor stoppers and expansion and contraction of the gas from wide changes in temperature.

FIGURE 3.—Orifice meter in which different sized orifice plates may be used.

<sup>a</sup> Burrell, G. A., and Jones, G. W., Methods of testing natural gas for gasoline content: Bureau of Mines, 1916, pp. 21-34.

<sup>b</sup> Burrell, G. A., Seibert, F. M., and Oberfell, T. G., The condensation of gasoline from natural gas: Bureau of Mines, 1915, pp. 27-46.

## COLLECTING A SAMPLE BY AIR DISPLACEMENT.

Filling a bottle or other container by air displacement is a rapid and convenient method, often used in the field. A small hose is placed over a pet cock in the gas line, the other end being inserted inside of the container. A gentle stream of gas is then allowed to flow into the container for four or five minutes, displacing the air. If the gas is known to be lighter than air it is best to invert the bottle, thus allowing the light gas to displace the heavier air; if the gas is heavier than air, the reverse method is preferable. The bottle is then quickly corked, and sealed by covering the stopper with a coating of warm paraffin. The difficulty with this method is the uncertainty whether all of the air has been displaced by the gas.

## COLLECTING A SAMPLE BY WATER OR MERCURY DISPLACEMENT.

A more accurate method of obtaining a gas sample is by the displacement of water. In this method the bottle is filled with water and inverted beneath the surface of water in a bucket or other convenient receptacle, the hose from the gas line is allowed to discharge below the mouth of the inverted bottle until the water in it has been entirely displaced by the gas. The bottle is then closed or corked while still beneath the surface, and after drying and sealing with paraffin, can be transported without danger of contamination of the contents.

Mercury may be used in the same manner as water, but requires that considerable volumes of this liquid be kept with the sampling apparatus, which adds to its bulk and weight. Displacement of mercury is, however, the most accurate method of filling a container with the gas to be tested, and insures the least possible contamination.

## SAMPLING AND TESTING IN GENERAL.

All tests, measurements, and determinations of natural gas to be used for gasoline manufacture should be checked and proved. Duplicate tests, analyses, and measurements should be made by different persons, if possible. If the duplicate results show variations large enough to be of importance in determining plant capacity, methods, or equipment, a third test should be carried out to determine which results can be trusted and can be used in plant design. Too much importance can not be placed on accurate testing and measuring of gas to be treated for gasoline content, for although during the treatment in a commercial plant many problems arise that can not be foretold, many characteristics of the gas can be determined which have a direct bearing on the pressures and temperatures necessary and the gravity and vapor tension of the condensates produced.

### METHODS OF NATURAL-GAS GASOLINE MANUFACTURE.

Plants treating natural gas for its gasoline content fall under one of three mechanical and physical subdivisions—compression, refrigeration, and absorption, or a combination of these methods. Each division varies widely in mechanical details of both equipment and operation. Gasoline recovery by compression and refrigeration will be discussed in the following pages. Recovery by absorption methods has been described in Bulletin 120.<sup>a</sup>

#### THEORY OF PRECIPITATION.

##### CONDENSATION BY COOLING.

The theory of the precipitation of vapors from natural gas is in a way comparable to that of the precipitation of water vapor from the atmosphere. Water vapor is known to exist in the air at all times in varying proportions, but is invisible unless condensed by cooling. Cooling to a temperature below that at which the air is saturated with the water vapor, it contains causes precipitation in the form of snow, hail, frost, rain, fog, or dew. This fact is also illustrated by beads of water collecting on the outside of a pitcher of ice water, and by the formation of frost on the refrigeration pipes of expansion units, as shown in Plates V, C, VI, and VII (pp. 34 and 36). The air coming in contact with the cold surface of the pitcher or pipes is cooled below its dew point and the moisture which it can no longer hold as vapor condenses as water or frost on the surface. By further cooling of the air more moisture would be condensed, and if cooling were carried far enough practically all of the water vapor could be precipitated without the aid of pressures higher than atmospheric.

##### CONDENSATION BY COMPRESSION.

In plants compressing air it is found that air, after having been made more dense by increase of the pressure and decrease of the volume, deposits moisture at atmospheric temperature, and as the pressure is increased larger percentages of the contained water vapor are precipitated. Hence either high pressures or low temperatures increase the condensation of the water vapor.

In the exceedingly dry atmosphere of the Arizona and Nevada deserts, operating air compressors at a pressure of 100 pounds and cooling the compressed air only to atmospheric temperature always causes precipitation of water, and of lubricating oils from the cylinders, in the air receiver. That all of the moisture in the air is not deposited in the receiver is shown by the fact that in pumps driven by compressed air some moisture freezes in the cylinders and also forms frost on the exhaust outlet.

<sup>a</sup> Burrell, G. A., Biddison, P. M., and Oberfell, G. G., Extraction of gasoline from natural gas by absorption methods: Bull. 120, Bureau of Mines, 1917, 71 pp.

The condensable fractions in natural gas, like those in air, are not visible under ordinary conditions, but at times the sudden release into the atmosphere of gas from confinement under pressure will cause vapors of hydrocarbons to form a mist resembling fog or steam.

In the treatment of natural gas for gasoline recovery the result desired could be accomplished either by compression or refrigeration, but the complex mixture of gases and vapors complicates the problem. Without an exact knowledge of the various members and the proportion of each to the whole, an attempt to calculate the most suitable pressures and temperatures becomes little better than a guess, and the most practical solution is by tests and experiments. According to the law of partial pressures,<sup>a</sup> if gas contains 10 per cent of condensable vapor and is under a pressure of 200 pounds, the condensable 10 per cent has acting upon it a partial pressure of 20 pounds, or 10 per cent of the total pressure. As the proportion of different condensable vapors in the gas becomes smaller through their partial condensation, the partial pressure acting on them also becomes less. The percentage of the gage pressure acting on any one of the gas or vapor constituents varies in proportion to the percentage of volume occupied by that constituent. If the constituent is condensable, condensation will lower its proportion to the volume of uncondensed gas to a point at which the partial pressure acting on it is too small to cause further condensation, leaving a portion of the vapor uncondensed throughout the entire treatment. As the acting pressure becomes lower, condensation tends to cease, but lowering the temperature will cause further condensation. Under constant gage pressures and decreasing temperatures, the largest percentage of the heavier hydrocarbons contained in the gas is recovered, and the losses are confined to the lighter members.

Although all of the condensable vapor and even the true gases can be liquefied by increasing the pressure or reducing the temperature sufficiently, the application of these processes in treating natural gas for gasoline is limited by the commercial considerations. Extremes of either pressure or temperature would yield condensates too volatile for commercial use, also the machinery and other equipment required would be expensive to install and difficult to operate and maintain.

To recover the valuable hydrocarbon fractions that are held as vapors in natural gas, only such pressures and temperatures are necessary as can be obtained by the use of machines and fittings of standard construction and capacities. As the power used to compress the gas heats it, developing power by expanding the compressed gas cools it. By using the cooled gas as a refrigerant, the

<sup>a</sup> Locke, C. E., *Engineering thermodynamics*, 1912, p. 481.

temperature necessary, in conjunction with the pressures obtained, to extract the maximum of commercial condensate can be developed.

The temperature and the pressure that will yield the most profitable results are those that together will recover the largest possible amount of condensates of low vapor tensions and as much of the lighter parts as can be so blended or handled as to conform with legal standards of safety and make a good motor fuel

#### **ABSORPTION THEORY.**

The absorption process for recovering condensate from natural gas is based on an entirely different physical property, that of the solubility of vapors in liquids. In this process the gas is brought into intimate contact with a liquid which dissolves or absorbs the vapors; these vapors are later distilled from the absorbing medium and condensed.

#### **USE OF COMBINATION COMPRESSION AND REFRIGERATION PROCESS.**

As shown above, the fundamental principles of the compression process are compression and cooling of the natural gas to pressures and temperatures at which certain hydrocarbons condense.

Plants of this character are erected to treat casing-head gas from oil sands or from sands closely associated with oil, the gas being brought to the surface either between the casing and tubing of an oil well or with the oil in the tubing. The quantity of gas from each well is usually comparatively small and in some installations as many as 500 or 600 wells are connected with one compression plant of not more than the average capacity.

The dry (treated) gas is, at most plants, used on the oil leases to drive the gas engines of the compression plant, and also for gas and steam engines in pumping and drilling wells. A few compression plants sell the treated gas for commercial use in cities or for manufacturing purposes. The cost of pipe lines and equipment necessary to deliver the small quantities of gas to market would, in general, be excessive. There is seldom much gas left after the quantity necessary for furnishing power has been used.

The value of the gas for heating, power, and lighting is not impaired appreciably by removing the gasoline content. If this gas were not treated, the gasoline would, at most leases, be burned with the gas used for power purposes and practically be wasted as far as serving any useful purpose is concerned.

#### **GAS LEASES.**

Until 1914 practically all the gas being treated for its gasoline content was sold or leased under varying conditions to gasoline producing and marketing companies independent of the companies pro-

ducing the oil. Since that time the oil producing companies, realizing the profits to be made, have constructed compression plants to treat the gas produced with the oil on their leases, and in many instances are now purchasers or lessors of gas from surrounding properties.

Before 1914 gas leases were made mostly on a flat rate, which varied from 2 to 5 cents per 1,000 cubic feet. Often the contract stipulated the vacuum to be held on the oil wells, and specified that any treated gas not used to run the compression plant was to be returned to the lease from which it was taken, the return gas lines to be paid for and laid by the purchasing party. Other leases required that a certain percentage of the gas delivered to the compression plant should be returned, this figure in some instances being as high as 80 per cent.

#### SLIDING-SCALE LEASE.

One lease in Pennsylvania required that 7 cents per 1,000 cubic feet of gas be paid the lessor when the price received by the lessee for gasoline in tank car lots during the preceding month averaged 10 cents per gallon or less, and an advance of 1 cent per 1,000 cubic feet for each advance of 2 cents in the monthly average price of gasoline. The gasoline company had made arrangements to sell the treated gas at 12 cents per 1,000 feet to a company which supplies gas to near-by towns. This was one of the few plants found by the writer that made such disposal of the dry gas.

Such a form of contract, known as the sliding-scale lease, is being used almost entirely at present in the Mid-Continent fields, except that usually the contract stipulates that gas after treatment shall be returned to the lease from which it was originally taken. It also provides that all gas necessary for power to operate gas and water pumps as well as the compressor plant, shall be taken from the treated-gas lines at no cost to the lessor.

At the present time (December, 1916) leases in Oklahoma are being made on what is known as the 4-10 or the 5-10 basis, meaning that the price paid for the privilege of removing and selling the gasoline from the gas is to be 4 cents or 5 cents per 1,000 cubic feet when the price received for the product is 10 cents per gallon, with an increase of 1 cent per 1,000 feet of gas for each additional 2 cents per gallon, as in the Pennsylvania lease previously mentioned. On the 4-10 scale, with gasoline selling at 18 cents per gallon f. o. b. the plant, the price paid for gas would be 8 cents per 1,000 feet.

#### WEAK POINTS OF LEASE.

There seems to be two very weak points in such a form of contract; one is that no account is taken of the present or future quan-

tity of condensate in the gas, and the other is that as the wells and field grow older the percentage of gas returned to the original owner will become progressively less and eventually will become nil. In the Glenn pool, Oklahoma, this point has been reached at some plants.

In one plant, to the knowledge of the writer, the volume of treated gas discharged is at times insufficient to furnish fuel for the engines running the pumps and compressors. This condition is quite usual in older districts such as Sistersville, W. Va., where dry gas is bought to operate the compression plants, or, as at one plant, electric power is purchased and is used to drive the compressors.

As the quantity of gas decreases, the owner will receive less for the gas and have less treated gas returned to him, being forced eventually to buy gas for lease power while the plant operator will, for a long time at least, make the same or a slightly decreased quantity of marketable condensate. It would seem that these conditions should be taken into account in the gas contract.

#### ROYALTY LEASES.

Royalty leases are made and held in some fields, particularly in California, but do not seem to have been generally used throughout the United States.

Before the compression process and its results became well known and understood, gas could commonly be obtained on a royalty of one-eighth of the value of the product marketed, but as the gas producers learned of the treatment and profits, royalties have increased. In California, as much as one-third of the value of the product for gas containing less than 2 gallons of gasoline per 1,000 cubic feet is being paid. The writer is reliably informed of a contract in Oklahoma under which a royalty of one-half is being paid, the gas producing between 4 and 5 gallons of gasoline per 1,000 cubic feet.

#### FACTORS CONTROLLING ROYALTIES AND LEASES.

The royalties and prices that can be paid for gas under lease for gasoline recovery depend on the following conditions:

Wells scattered over a wide area will necessitate an expensive gathering system, including pipe lines and pumps or booster stations, and the cost of operation and upkeep. The quantity of condensate in the gas is vital because the cost of a plant and of plant operation is practically the same for rich or lean gas. If the gas is to be returned to the original owner for use on the lease, the cost, upkeep, and operation of the return or "dry gas" line are to be considered. The distance from a railroad station and the length of pipe lines required to bring the blending naphtha to the plant and transport the product to the station, also the distance from a market, and the source of naphtha supply will have a bearing on production and marketing costs.

The time the lease or contract is to run is also a factor which directly affects the price that is to be paid for gas, as the total cost of installation must be paid out of net receipts by the time the contract expires.

In general, all the factors entering into any manufacturing enterprise must be taken into consideration when the price to be paid for gas leases or royalties is being set.

### **METHODS OF COLLECTING NATURAL GAS.**

The term "casing-head gas," when strictly applied, means gas coming from an oil sand between the casing and the tubing through which the oil is pumped. This term, however, as used in connection with compression plants, has been broadened so as to apply to any gas rising with oil in the tubing, or from flow lines, and to vapors coming from oil in traps or flow tanks.

In eastern practice it is usual to collect only the gas coming up between the casing and tubing in wells which are usually held under high (20 to 26 inches of mercury) vacuums, no attempt being made to collect the gas coming up with the oil in the tubing or the light fractions given off in flow or storage tanks. Oklahoma operators collect gas at the casing head, and in some instances from flow lines and flow tanks. In California an entirely different practice has developed, because of the soft running oil sand in most California fields. The oil and gas from one or more pumping or flowing wells is led into a specially built tank, called a trap. Traps of different designs are so constructed and operated as to permit the separation of the oil and the gas at pressures either above or below atmospheric, as circumstances may require.

#### **USE OF TRAPS.**

Originally traps were invented and designed to work under pressure with the object in view of separating, collecting, and saving the gas and also the oil atomized and mechanically carried with the gas into pipe lines or into the atmosphere; also to hold in the oil the gasoline fractions that would otherwise be volatilized when the pressure on the oil was released; and, further, to allow the oil to absorb as much of the condensable fractions from the gas as possible, thus raising the gravity of the oil and in a measure saving the most desirable fractions of the crude product. As an instance of the use of a trap and its effect on the oil produced, F. B. Tough, of the Bureau of Mines, cites the use of one at a gusher in the Midway, California, field. This well when flowing through a trap produced oil having a gravity of 32.5° B., and when flowing uncontrolled under considerable rock pressure into a collecting sump produced oil, as collected in the sump, with a gravity of 26° B., a gain of over 6° B. resulting from the use of the trap.

Traps are of interest to the casing-head industry principally as separators of oil and gas, or, as developed and used by at least one company, for holding a vacuum on the oil to separate from it such fractions as will distill off at the normal temperature and under a vacuum of 5 to 15 inches of mercury, thus reversing the usual effect and method of trap operation.

#### TRAPS HELD UNDER VACUUMS.

This company has found that the crude oil during transportation and storage and in transfer to the stills of the refinery lost a part of the lighter fractions; also, the temperature used in cooling the still vapors permitted further losses of the lighter fractions, which could be collected as vapor and saved by treating in a compression plant with the gas and vapors produced at the wells.

The method adopted is to relieve the crude oil of its lighter gasoline fractions by holding a vacuum on the trap, as oil is sprayed or flows into it with the casing-head and tubing gases, and treating all the gas and vapors thus obtained in the compression plant. The condensate, which has a gravity of 86° B., is held under a pressure of 10 to 15 pounds and kept cool by shading or insulating the storage tanks until the product is blended with naphtha.

This company has three different production conditions to

meet in the use of traps as follows: (1) Shallow pumping wells which have little or no gas pressure, (2) deep pumping wells with varying pressures of gas, and (3) deep flowing wells which have more or less pressure

FIGURE 4.—Trap used with shallow pumping wells.  
a, gas outlet; b, gas and oil inlet; c, oil outlet;  
d, manhole; e, clean out; f, holes for gage glass.

on both gas and oil at all times and flow by head. Each condition is met by the use of traps of somewhat different design and operation.

Oil and gas from the shallow pumping wells is carried through flow lines, each controlled by a check valve, to a manifold, from which all the oil and gas goes through one line to a simple trap (fig. 4), the gas drawn out at the top at 5 to 15 inches vacuum to the scrubbers and vacuum pump, the oil being drawn off at a point near the trap bottom, to storage.

Production from deepwells flowing or pumping by "heads," which often builds up pressure in traps and lines by rushes of oil and gas too large for the normal capacity of simple traps and vacuum pumps, is handled by traps of special design, shown in figure 5. Two lines are laid from the well; one from the well tubing carries oil and gas pumped, or flowing together, the other line carries gas from between the casing and tubing. These lines are joined a few feet back of the trap intake, thus forcing all the gas and the oil to flow together into the trap at a point near the top; the gas separates from the oil and flows out at the top of the trap to the vacuum pump. The oil flows out near the trap bottom through a Crane balanced globe valve. The stem of the valve is rigidly connected to a counterbalanced float tank, which rises as the oil in the trap becomes low, closing the valve; fills and pulls the valve open when the flow increases and the oil rises in the trap. The float tank is connected both to the top and the bottom of the trap, as shown in figure 5, by swinging

FIGURE 5.—Trap used on flow lines under pressure. *a*, gas outlet; *b*, gas and oil inlet; *c*, ball counter balance; *d*, float tank; *e*, 3-inch Crane balance globe valve; *f*, oil outlet; *g*, holes for gage glass; *h*, chamber; *i*, swinging pipe connections.

pipe connections. As the oil rises and falls in the trap oil flows in and out of the float tank through the bottom pipe connection. The top pipe connects the float tank and the top of the trap and acts only as a pressure equalizer. This trap is of standard design and is marketed by supply companies. The trap shown in figure 6 was

FIGURE 6.—Trap used with flowing wells.

designed by the company using this system of holding vacuums on traps. It is used, particularly with flowing wells, in much the same way as the trap shown in figure 5 and operates automatically.

When the oil level rises above a certain point the gas discharge shuts off entirely. This permits pressure to build up on both intake and discharge oil lines, causing a back pressure on the intake and a greater flow from the discharge; the trap thus clears itself and

returns to normal operation. It is set, as shown in figure 6, above both the well head and the storage tanks, so that when the oil and gas flow is small and a vacuum is built up in the trap the 20-foot drop and the horizontal check valve in the discharge line keep the oil from backing up into the trap, and permitting air to enter the trap and the gas lines.

As an example of loss of the light fractions of oil in storage, a 55,000-barrel storage tank filled with Cushing crude oil is reported by A. N. Kerr, of the Riverside Western Gasoline Co., to have lost by evaporation 9 inches, or 2.5 per cent of its total content, in one year. The loss, without doubt, consisted entirely of the light fractions that make up the gasoline content of the crude oil as it comes from the wells. Much of this loss might have been saved by using vacuum traps or by covering the tank and connecting it to the intake line of a compression plant.

#### FIELDS IN WHICH TRAPS ARE USED.

Traps are used more universally in the California fields than in other fields throughout the United States, because in California oil is sold on a gravity basis, making it desirable and profitable to retain as large a proportion of the light fractions as possible in the oil in order to keep the gravity at a maximum. The general practice, with the exception of the company using vacuum traps, previously mentioned, is to hold pressure on traps to save the light or gasoline fractions.

Plate I, *B*, shows a view of the Starke trap, designed and patented by Dr. Eric A. Starke, of the Standard Oil Co. of California, and used by that company.

Plate I, *C*, shows the McLaughlin compound trap, capacity 800 barrels of oil and 7,000,000 cubic feet of gas per day at 300 pounds pressure, patented by A. C. McLaughlin, of the Kern Trading & Oil Co., on the left, and the McLaughlin single-chamber trap, on the right. Plate III, *A* shows the cone chamber, McLaughlin trap.

Simple cylindrical traps used in the Fullerton field in conjunction with a casing-head gasoline plant are shown in Plate IV, *A*.

#### GATHERING LINES.

Gas from casing heads, tubing, traps, or flow tanks to be treated by compression is led through small (usually 2-inch) lines to a gas main that carries it directly to the plant or to a vacuum or pumping station.

At plants where the gas comes from near-by wells and the gathering lines are short, and it is not desirable to hold a high vacuum on the wells, the vacuum needed to carry the gas through the lines is

often developed in the low-pressure cylinder of the compression plant. By this method a vacuum pump is at many plants unnecessary, and the plant is simplified by requiring one less unit. From this condition the practice varies to plants at which gas is gathered from areas as large as 32 square miles, with 6 and 8 inch mains 7 to 10 miles long, and as many as 30 substations or gas pumps forcing gas through the pipe lines to the compression plant and holding the desired vacuum on the wells. In order to hold high vacuums on the wells from which gas is being drawn it is necessary to have the vacuum pump close to the wells, as it is impossible to maintain a minimum pressure through pipe lines of great length.

In designing a plant or plants to treat gas coming from a large area the number of plants, the number of vacuum and booster stations, the situation of the plant or plants, and the size and length of the pipe lines require careful mathematical calculations to determine the most economical installation. Many plants visited by the writer showed that little or no consideration had been given to these features. Such conditions may be due partly to the use of gas lines laid before the treatment of gas was considered and the reversal of the direction of flow in parts of such lines in order to bring the gas to the plant. The fall in pressure as the gas flows through the pipe lines and the increase in volume caused by the lowered pressure and the increased number of lead lines from wells as the gathering progresses toward the plant, make it essential to use pipes of progressively increasing diameter as the gas approaches the plant.

If vacuum pumps and booster stations are placed at points in the gathering lines to reduce the volume and increase the pressure of the gas, the lines leading from such plants may be smaller than those transmitting the gas under lower pressures.

In practice the sizes of gas mains have been determined usually by rule of thumb and bear little relation to the actual volumes, gravities, and pressures of the gas.

#### FLOW OF GAS IN PIPE LINES.

In designing gathering systems of compression plants to treat or pump gas, the determination of the proper size of pipe to use in lines for carrying a given quantity of gas at known pressures is so essential that the writer believes the formulas covering these points will be of value and interest to those engaged in compressing gas. Formulas and tables on the flow of gas in pipes have been developed by T. R. Weymouth, of Oil City, Pa., and discussed by him in a paper<sup>a</sup> written for and published by the American Society of Mechanical Engineers. These formulas, with that part of the paper that treats of the flow of gas in pipe lines, are given on pages 107 to 112.

**DRIPS AND SCRUBBERS.**

Particles of crude oil are often carried into gas lines from flow lines, flow tanks, and traps; these, with fractions of heavy vapors condensed by changes in temperature and pressure of the gas in the transmission lines would, if not removed, cause trouble in the pipes, damage machines and meters, and discolor the condensate produced in the first-stage accumulators.

**DRIPS.**

Drips are placed at the low points in gas pipe lines to collect and remove condensed moisture and naphtha vapors and crude oil carried into the line, which if permitted to accumulate would restrict the passage and might do considerable damage by being forced through the line as a slug, forming a powerful hammer. The type of drip usually found is constructed of one or two lengths of 6 or 8 inch pipe capped at both ends and connected by a 1 or 2 inch pipe and valve, placed at the lowest point of a downward curve in the gas main. The liquids settling to this point drain into the drip and are either blown out and wasted, or, if the quantity and quality warrant saving, are collected in tanks and, after being distilled or filtered, are used for blending or are sold.

Officials of a plant visited by the writer gave the following data on "line distillates" collected by tank wagons from the gas-line drips:

*Data on distillate collected from gas-line drips.*

	Volume collected, gallons.
August, 1915.....	7,000
November, 1915.....	14,625
January, 1916.....	19,142
March, 1916.....	11,549

Average gravity for an entire year, 55° B.

The figures represent the total quantity of condensate collected during the month named and show the direct effect of atmospheric temperature on the quantity precipitated. The product as collected was discolored, but as all the condensate produced was shipped to the refinery with the crude oil in pipe lines, the color of the line distillate was of no importance.

**SCRUBBERS.**

The term "scrubber," as used in the casing-head gasoline industry, is restricted in its meaning to tanks for settling liquids out of the gas or to tanks fitted with baffles or some form of filter for removing liquids or dust from the gas, and is not used, as in the coke-oven or the artificial gas industries, to designate equipment in which certain constituents are removed by chemical action or absorption in liquids.

The usual form of scrubber is a vertical tank (see Plate IV, B) varying from 3 by 6 feet to 6 by 20 feet in size, with a gas inlet in

the side and near the bottom, the end of the inlet pipe being turned downward or fitted with a baffle, so that the gas discharges toward the bottom. The gas rises through the tank slowly, thus permitting particles of liquid or dust to settle.

Scrubbers of the filter type are of the same size and form as the settling tank, but have perforated horizontal partitions on which are various filtering mediums such as moss, hay, or sponge. When the filtering medium becomes saturated or dirty it is removed and burned, if moss or hay, or is cleaned and replaced, if sponge is used. Scrubbers are always put in pipe lines ahead of compression machines, meters, and the pump. They also serve as intake receivers for the gas pump or the compressor, one tank, 3 by 6 feet in size, being used on the intake of each machine, or a tank of corresponding larger capacity for the entire plant intake.

#### VACUUM STATIONS.

The number and the situation of vacuum pumps and booster stations on a gas-gathering system depend on the vacuum to be held on the wells, and the length and size of the pipe lines through which the gas is to be forced. When it is desired to hold the vacuum on the wells at the maximum, as is usual in the eastern fields, the vacuum pump must be placed near the wells, because friction, and often pipeline leakage, reduces the suction on the well. The most common vacuum-pump installation consists of a gas engine of 35 to 70 horsepower belted to a duplex pump having cylinders varying between 10 by 17 inches and 20 by 20 inches. Intake pressures vary between 14 and 26 inch vacuums, and discharge pressures between a vacuum of 5 inches and a gas pressure of 5 pounds.

The "booster," if used, is to be placed in the same building as the vacuum pump. Power is developed by a 25 to 70 horsepower gas engine, either belted or direct connected to a compressor used to increase the pressure and force the gas through field lines either to another pump and booster or to the main compression plant. Compressors used in this way take gas directly from the discharge of the vacuum pump, usually holding a light (zero to 5-inch) vacuum at the intake, thus relieving the pump from working against high discharge pressures. Gas pumps are built too light to pump gas against pressures exceeding 10 pounds and usually discharge at nearly zero gage pressure. Compressors used as boosters deliver gas to the lines at pressures of 20 to 40 pounds and at any temperature incident to the compression.

Keeping gas under positive pressure through as much of the gathering system as possible tends to prevent air being drawn in and contaminating the gas, although any pressure high enough to keep air from leaking in also permits some gas, charged with condensable

C. "MAKE" AND STORAGE TANKS, SHOWING PIPING AND PRESSURE VALVES.

vapors, to escape. Air in gas cuts down the volume of gas treated, necessitates the use of higher pressures to precipitate the condensate, and carries varying proportions of water vapor which condense with the gasoline. Another advantage of transmitting gas under pressure is that pipe-line capacities are increased, making possible the use of pipe of smaller diameter in the gathering system.

There is a decided tendency at the present time in favor of welded joints in pipe lines to carry gas either at vacuums or positive pressures. It is claimed that lines with such joints cost less in upkeep and repairs and can be maintained practically gas tight.

#### SITUATION OF PLANT.

Factors entering into the problem of the best situation for a compression plant to treat gas from a given area are so numerous and varied that no rules which would apply even in a general way to all conditions found in oil fields can be given.

The most important factors and those which will have the greatest weight in determining the most practicable situation for a plant are: Water supply, transportation facilities, and the length of gathering lines and return dry-gas lines necessary. In eastern fields an ample water supply can usually be easily obtained from a creek, river, or well, and causes little concern to plant operators, but in the Mid-Continent and the western gas-producing areas the question of water supply often becomes of major importance.

In the California fields some plants pay as high as  $3\frac{1}{2}$  cents per barrel for water, which has to be treated or condensed before it is fit for use in boilers or jackets. Other plants pump their water for distances of several miles, and at these the cost of installation, operation, and upkeep of the pumps and the pipe lines make the cost of water an important item. One California plant is using water separated from the oil in a dehydration plant on the cooling coils, and is distilling and condensing water for jacket use, all other sources of water having practically failed.

It is obvious that the nearer the plant is to the center of gas production the smaller will be the size of the pipe lines and the amount of power required to conduct the gas to the plant. However, other factors, such as water-supply and transportation facilities may affect the choice of a site. The plant should be so situated as to suit best all conditions, each being considered in regard to the others. Compression plants are often built on a hillside, advantage being taken of the natural slope to install a gravity system of handling the water and the condensate. The water, being drained from all points of use to one pond or basin, requires only one pumping unit to return it to the top of the towers or the storage tank above the plant, from which it is drawn for all purposes. Plates II, B, and III, B,

show plants using a gravity system for handling water and condensate. In this system the condensate can be run by gravity from accumulators and "make" tanks to storage and blending tanks. The accumulators do not have to be set in pits or cellars; this is a decided advantage, because gasoline vapor may collect in such pits, unless they are thoroughly ventilated, in sufficient quantity to form an explosive or asphyxiating atmosphere and endanger the safety of the plant and the men. At plants visited by the writer three men have lost their lives by suffocation in pits filled with gasoline fumes. Some plants have a rule that a man before going into a cellar containing accumulator tanks shall notify another workman, or, if there is known danger from leaks, men shall work only in pairs or within calling distance of each other. Plants are often built on a hill or rise because of the better ventilation and the cooling effect on water towers and coils.

#### DATA ON PLANT PRACTICE.

A number of tables compiled from data taken at each of the plants listed in Table 2 or given to the writer by owners or by officials of the various companies are presented herein.

In Table 2, column 1 shows the field in which each of the plants is situated. Each plant is given a number, shown in column 2, which it retains throughout all tables and discussions following. Capacity and production data of these plants are shown in columns 3 to 5. Column 3 shows the quantity of gas treated, in thousands of cubic feet, as estimated by plant operators, or computed from meter readings, or from the compressor displacement and the number of revolutions, or the pipe-line capacities at measured pressures. Column 4 represents the production, after weathering, of unblended gasoline, and is approximately the quantity of condensate sent to market. Tank-car outage (or loss in transit) has not been deducted, as that factor varies widely with the distance traveled by the cars and the temperatures encountered during the shipment. Column 5 shows the number of gallons of condensate produced from each thousand cubic feet of gas treated, based on the plant capacity and the total product sold, as indicated in column 4. The gravity in degrees Baumé, as given in column 6, is determined from the plant product as a whole, before blending, or computed from the gravity of the blend, the quantity and the gravity of the blending stock used being known.

<sup>a</sup> Volume of gas estimated from product at 4 gallons per 1,000 cubic feet, a conservative estimate for gas from wells in the Glenn pool.

<sup>b</sup> 50 per cent of this product was from low-pressure cylinder and 50 per cent from high-pressure cylinder and expansion coil.

In the following pages the writer has endeavored to describe as nearly as possible the treatment of natural gas in the recovery of gasoline by the compression process, and the mechanical units used.

The controlling functions of low and high pressure compression units of the plants studied by the writer are shown in Table 3.

Plant 2 is described in detail in pages 63 to 65. Plant 5 is a gas-pumping station, the condensate collected in cooling the gas before transmission is noted as production in Table 2 (p. 29). This gas after transmission through the pipe lines is treated in an absorption plant. Plant 10 uses three-stage compression. Plant 25 uses one-stage compression, compressing to a pressure of 150 pounds. Plant 80 is a refinery at which uncondensed still vapors are treated by compression; this plant is described in detail in later paragraphs.

#### PLANT INTAKE.

Table 3 shows that the temperature and the pressure at the plant intakes vary widely. The pressures tabulated as pressure at plant intake represent the pressure shown at the suction of the first-stage compression cylinder. Vacuum pumps, even if installed at the plant, are considered as part of the gathering system, and vacuum at plants where the compression cylinders are used to hold vacuum on the gathering system is taken as part of the compression operation and not as a part of the gathering system to which it rightly belongs. The intake pressures used vary from 18-inch vacuum to 5-pound pressure, and the temperatures from 60° to 125° F., the average

pressure being approximately that of the atmosphere, and the average temperature 80° F. The temperature of 60° F. noted above was recorded at plant 1, where the gas is cooled in coils placed in a water tower before it is compressed, and the temperature of 125° F. at a plant where a vacuum-pump discharge is used as the first-stage suction without cooling.

#### PRECOOLING.

Cooling the gas before it enters the first stage of compression, although not generally practiced, has distinct advantages. Reducing the temperature of the gas decreases the volume, the intake pressure remaining the same, so that more gas is taken into the compressor cylinder at each stroke, thus increasing the efficiency.

In warm climates plants having gathering lines, traps, and scrubbers exposed to the sun, which may heat the incoming gas to temperatures higher than 110° F., or having gas pumps and "booster" compressors in the gathering systems with no cooling coils after such units and before the plant intake, can by installing coils or other cooling apparatus increase both the plant efficiency and the carrying capacity of the pipe lines. Cooling the intake gas 30° or 60° F. will increase the quantity treated by a compression unit 5 to 10 per cent and lower proportionally the temperature of the gas discharged from the compressor.. (See Table 11, p. 112.)

A plant in California lowered the temperature of the gas about 40° F. by passing it through a water-cooled coil ahead of the low-pressure intake. On the day of the writer's visit 1,250,000 cubic feet of gas was handled and the temperature lowered from 114° to 74° F. The coil used consisted of twelve 3-inch pipes 25 feet long, in 10-inch headers, placed horizontally in the cooling tower below the high and the low pressure gas coils.

A plant in Louisiana uses water cooling ahead of the vacuum pump and the first-stage compression intakes. In gas transmission gas piped to market is always cooled before being permitted to enter the mains, in order to increase the capacity of the line and to precipitate as much condensate and water vapor as possible.

*c* Low-pressure cylinder; three stages used.

*d* Intermediate cylinder.

*e* 0.920, low compression; 0.480, intermediate compression.

**FIRST-STAGE PRESSURES AND TEMPERATURES USED.**

In plants using two-stage compression, the average pressure developed by the first stage is between 40 and 50 pounds per square inch; the temperature rises to between 200° and 250° F., depending on the temperature of the gas at the compressor intake and the number of compressions developed.

The increase in temperature of the gas from compression is a function of the power used to raise the pressure to the desired point. The power used depends on the number of compressions through which the gas is forced between its initial and final volume. As the amount of power actually expended, and not the initial and the final pressure, determines the rise in temperature the temperature increase due to a given number of compressions should be the same. If the intake temperatures of the high and the low stage compressor cylinders are equal, the final, or discharge, temperature of both cylinders of a two-stage compressor or of two single-stage machines acting as a high and a low stage unit should be the same, provided they are of equal horsepower and working properly and under uniform conditions. This is found to be approximately true in plant practice, as is shown by the temperatures of the compressor discharges given in Table 3.

The line carrying the compressed gas from either the high or the low stage cylinder is usually fitted with safety valves set to pop at pressures of 5 to 20 pounds above the desired pressure in order to protect the machine in case a valve farther along in the system may have been left closed or a pipe in the coils or other units in the gas circuit should become stopped or clogged, thus causing pressure to build up throughout the system. In plants using expansion engines this condition may occur at any time through the engine valves freezing, thus stopping the usual discharge.

**ATMOSPHERIC COOLING.**

The compressed gas discharged from the compressor is carried through an oil separator, placed just ahead of the cooling coils, which traps any lubricating oil vaporized in the cylinders or carried mechanically with the gas, the oil being condensed by the time the gas reaches the trap. Cooling to this point is effected by radiation to the atmosphere surrounding the gas discharge pipe and to the jacket water around the compressor cylinder. Some operators are employing air cooling extensively in order to save water, the practice being to use a much larger pipe, exposed as far as possible to the atmosphere, for conveying the hot gas from the compressor discharge to the water coils, thereby reducing the speed of flow and so increasing the time of transmission that the temperature of the gas is materially lowered. One plant with a daily capacity of 1,250,000 feet and using 6-inch pipe to carry both high and low

A. COOLING TOWERS, MANIFOLD INTAKE, AND DISCHARGE LINES AND HEADERS.

B. HIGH AND LOW PRESSURE COILS WITH INTAKES ALTERNATING.

pressure gas to the coils, reduces the temperature between the compressor discharge and the coil intake  $80^{\circ}$  ( $240^{\circ}$  to  $160^{\circ}$  F.) even in warm weather. In cold weather the reduction is greater.

Methods of air cooling are being rapidly developed and installed in districts where water is scarce and expensive, or the supply uncertain.

#### COOLING COILS.

In the eastern fields the cooling coils are generally of the continuous, submerged type, consisting of a 2-inch pipe 20 feet long, submerged in a tank of water. The total length of the coil varies between 300 and 500 feet, and the radiating area is 0.6 to 0.7 square feet per 1,000 cubic feet of plant capacity, and 2 to 5 square feet per horsepower used in compression. A continuous flow of water through the tank cools the gas to approximately the same temperature as the water.

In western and Mid-Continent practice a different method has been developed. Because of the difficulty of obtaining a continuous supply of cool water, it is necessary to use the same water over and over again in a closed circuit, the water being cooled in towers or in sprays over the principal storage pond or basin.

#### COOLING WATER BY EVAPORATION AND RADIATION.

Water exposed to air cools in two ways—by radiation, as long as the water is warmer than the air, and by evaporation.<sup>a</sup> To obtain the greatest cooling effect the water must be so exposed to the air as to present the greatest possible surface. At some plants the water is cooled in towers (Pl. V, A) by means of sprays, or by permitting the water to fall in small streams on wire netting or screens, usually placed above the coils, thus atomizing the water and presenting a large surface to the air. The falling spray is often collected by V-shaped troughs that are placed a few inches above the top pipe of the coil and direct the flow of cooled water over the entire series of pipes. The water, dripping from the lowest pipe of the coil, is collected in a shallow basin beneath the coil and the tower, pumped to the top of the tower, and used again.

Plates VI and VII show views of a compression plant and the general arrangement of towers, compressor building, and storage tanks.

Some plants use a spray over a pond. The water is collected beneath the coils and conducted to a cistern from which it is pumped through upward sprayers placed over the storage pond, thence it is again pumped over the coils. The finely divided particles of water in the spray are cooled by radiation and evaporation while falling into the main body of water below. This system, although producing

<sup>a</sup> Hausbrand, E., *Evaporating, condensing, and cooling apparatus*, 1903, 400 pp.

satisfactory temperatures, wastes more water than the tower installations, more being carried away mechanically by the wind; there is also a waste due to seepage, if the pond is of earth. The surface of the water in the pond is often exposed to the heat of the sun, which warms the body of water after cooling and before use over the coils. The sun has a decided effect in raising the temperature of the water in regions where the weather is warm during a large part of the year, as in Oklahoma and southern California.

#### WATER COOLING IN TOWERS.

In towers, during hot dry weather, temperatures  $10^{\circ}$  to  $40^{\circ}$  F. below that of the atmosphere are at times obtained with minimum losses of water. Many plant operators who have not experimented to find the amount of water that gives the lowest temperature to the gas being treated, use far more than is needed or gives the best results. Water falling in excessive quantities in a tower does not acquire the lowest possible temperature from radiation or evaporation, and the large bulk of water flowing over the coils can not cool the gas as efficiently as a smaller amount does, for the same reason. The best results are obtained when minimum quantities of water are circulated and finely divided while passing downward through the tower. Only enough of the cooled water should be directed onto the pipe coils to keep all parts thoroughly wet, thus giving the water the greatest possible opportunity to evaporate.

The use of auxiliary cooling agents such as ammonia or ammonia and brine is discussed later in connection with the descriptions of plants using such methods.

It may be of interest and use to operators to note here the latent heats of vapors being treated in the cooling coils. Burrell<sup>a</sup> gives the following values for the latent heats of some petroleum distillates:

*Specific gravities and latent heats of four distillates.*

	Specific gravity, °B.	Latent heat, B. t. u. per pound.
Kerosene.....	43	105
Naphtha.....	56	103.5
Gasoline.....	65	100.6
Gasoline.....	89	100.2

In gasoline computations it is customary to use as the latent heat 100 B. t. u. per pound. Kent gives the specific heat of liquid gasoline of specific gravity 0.68 to 0.70 as 0.53 to 0.55, and Lucke<sup>b</sup> quotes Regnault as stating that methane gas has a specific heat of 0.5929 at constant pressure and 0.4505 at constant volume.

VIEW OF 2,500,000-FOOT PLANT SHOWING ARRANGEMENT OF COMPRESSOR BUILDINGS, TOWERS, AND STORAGE TANKS.

ANOTHER VIEW OF PLANT SHOWN IN PLATE VI.

**TYPES OF COILS AND CONNECTIONS USED.**

Two systems of pipe connections are used between compressor discharges and cooling coils. In one system all low-stage compressors, and likewise all high-stage compressors, discharge the compressed gas into a common pipe or manifold, from which it is distributed by a manifold to the different sets of coils being used to cool the hot gas. (See figure 9, page 50.) The other system is to lead the gas discharged from each cylinder through a separate coil which cools only the gas from that compressor, the gas treated by each unit being kept separate throughout its entire circuit. The first method has the advantage of permitting one coil to be shut down or cut out for repairs while the compressor is running, the discharge from that machine being cooled in the coils still in use, or conversely, the coil may remain in use while the compressor is idle, and treat gas from other units. In the second method of connection if any coil or machine is out of commission the entire unit of which it is a part must be stopped, causing more of the plant to be idle.

Throughout the districts making natural-gas gasoline the 2-inch pipe in cooling coils is standard, and only a few plants using other sizes were found by the writer.

Systems and methods of connection vary widely, ranging from continuous return-bend coils in which all of the gas passes through the entire coil, to coils which divide first into two or more headers, and then into numerous separate pipes. In the multiple-header system each portion of gas passes through short lengths (20 to 80 feet) of the coil, and is again collected by headers before going to the accumulator tank and to the next stage of treatment. In the continuous system the gas passes rapidly through the total length of pipe, its temperature being reduced during the whole time of travel from end to end of the coil. In the multiple method the rate of flow in each pipe is reduced in proportion to the number of pipes used, so that the gas is sufficiently cooled while traveling through such a short length of coil.

There is much difference of opinion among operators as to which method gives the more satisfactory results. Many of the newest plants combine the two methods, as follows: Each coil unit is divided at the intake by a header into 3 to 12 sets of 2-inch continuous return-bend coils, each being 4 to 16 pipes high, and generally 20 feet long, depending on the cooling area desired. The intake header is placed horizontally at the top of the coil so as to allow the gas to travel downward in the same direction as the condensate. At the lower end of each set of return-bend coils the gas and condensate are again collected in a header before passing to the accumulator tank. Coils of this type and of the single-pipe continuous type have

the great disadvantage of being "hard to get at" in case any length of pipe in the coil needs replacement, whereas in multiple-header coils in which the ends of each pipe are packed in a gland, any member can be removed or replaced without taking down any other part of the coil.

#### DIRECTION OF FLOW OF GAS AND CONDENSATE.

It is universally conceded that the direction of flow of gas and condensate should be parallel and not countercurrent. As the liquid will drain toward the lowest point in the coil, the gas must enter at the top in order to flow with the condensate. As an illustration of the effect of counter flow, a plant in the Caddo field using a countercurrent flow of gas and condensate in the water-cooled coils produces no condensate whatever in the accumulator tank at the end of these coils. The gas yields 11.8 gallons of condensate per 1,000 cubic feet treated, but this condensate is all precipitated in double-pipe condensers cooled by expanded gas to a temperature of 38° F., in which the flow of gas and liquid are parallel. Undoubtedly some condensate would be precipitated in the water-cooled coil if the direction of gas flow was reversed. Other plants have obtained similar results under like conditions; one example being a California plant, in which the coil discharge pipe sloped upward to the accumulator tank, permitting condensate to gather in the bottom coils and discharge pipe and be constantly in contact with flowing gas. The accumulator tank was lowered so as to allow a drop in grade from the coils, with the result that the yield of condensate at that point increased noticeably. It seems that the condensate on long and intimate contact with the gas as above described, is again taken up by the gas as a vapor, even at high pressures, and carried to some point more conducive to precipitation and separation.

That condensate vaporizes in accumulator tanks has also been proved and has given rise to the practice of trapping off the liquid as soon as collected. Because of the facts stated, it appears to be the best and most productive practice to separate the gas and condensate as soon as possible after all the condensable fractions have been precipitated and always to allow the gas and condensate to flow in the same direction. If the above arguments hold true under all conditions, it would seem to be advisable to divide the gas to be cooled into a number of coils or pipes that will retain it only long enough to obtain the maximum cooling effect from the water used, and to separate the gas and condensate as soon as possible.

In order to divide the gas from a header equally in each of the coils or pipes of a coil, an orifice disk is sometimes placed in the intake from the header; the constriction causes a slight back pressure, forcing the gas to enter each coil in approximately equal quantities. The

size of the orifice is arbitrarily determined by making the sum of the areas of the orifice openings equal to the cross-sectional area of the pipe leading the gas to the header from the compressor discharge or the discharge manifold, as the case may be.

#### **RADIATING AREA OF LOW-PRESSURE COILS.**

In Table 3 the total surface areas of coils used in cooling gas from low-stage cylinders of various plants visited by the writer are tabulated, with the area per 1,000 cubic feet of gas treated per day; also, the area per horsepower used in compression. The average area of coil is between 0.6 and 0.7 square feet per 1,000 cubic feet of gas treated daily and nearly 3.5 square feet per horsepower used in compression. The latter factor is more useful for plant design, as the heat developed in compressing gas is a function of the power used in compression and not of the volume of gas being treated. A cooling area of 4 square feet per horsepower is usually used at gas-pumping plants and has proved satisfactory in most fields.

Column 10, Table 3, gives the temperature of the gas leaving the low-stage water-cooled coils at plants where such data was recorded and available. Minimum temperature should be maintained to precipitate the maximum percentage of condensate and benefit high-stage compression, as explained in previous paragraphs.

From these coils the gas passes to the low-stage accumulator tanks. Each coil may be provided with a separate tank or all the coils may be manifolded to one tank. Plate III, *C* (p. 26), shows the alternate arrangement of accumulator tanks of high and low pressure coils, each coil having a separate tank. The tanks are usually 3 to 4 feet in diameter by 6 to 10 feet high. The gas is led in at the side of the tank and near the top through a pipe turned or baffled downward inside of the tank, discharging at a point about midway between the top and bottom. The condensate settles to the bottom; the gas discharges at the top to the intake line of the high-pressure cylinder if each unit is independent or to the high-pressure intake manifold if that system is used.

High and low pressure coils, with intakes alternating, used at one plant are shown in Plate V, *B* (p. 34).

#### **PRODUCTION FROM LOW-PRESSURE TREATMENT.**

The proportion of condensate collected in the low-stage accumulator tanks averages 15 to 30 per cent of the total yield and varies between nothing and 40 per cent, depending on the content of condensable fractions in the gas and on the temperature and the pressure used. Some operators permit condensate to accumulate in the tanks until the entering gas is forced to pass through it, or to accumulate for a given time, and then run it into the storage tank through a hand valve.

The general practice, however, based on the theory that to separate gas and condensate as soon as possible produces the best results, is to remove the condensate from the accumulator tanks continuously with a small automatic trap that dumps often and with but little agitation keeps the tank practically empty at all times.

#### HIGH-PRESSURE TREATMENT.

From the low-pressure accumulator tanks the gas passes into the high-pressure cylinder of the compressor, and the cycle is repeated except that the higher pressure causes the lighter hydrocarbons to condense.

#### RADIATING AREA OF HIGH-PRESSURE COILS.

Table 3, which gives the average surface areas of both high and low pressure cooling coils at the plants visited, shows that a somewhat larger cooling area is used for the high-pressure gas. The area of high-pressure coils per 1,000 cubic feet of gas cooled daily was between 0.7 and 0.8 square feet and about 4.5 square feet per horsepower used in compression, whereas that of the low-pressure coils averaged between 0.6 and 0.7 square feet per 1,000 feet of gas and 3.5 square feet per horsepower. If the same amount of power is used by each cylinder of the compressor, there seems to be no reason why one cooling area should be larger than the other, unless the gas was not cooled in the low-stage coils to the temperature later obtained in the high-pressure coils.

The experience of A. W. Peake,<sup>a</sup> engineer in charge of gasoline production of the Mid West Oil Co., causes him to "believe that the coil area of the intercooler should be larger than the area of the aftercooler coils, as it permits condensation of more gasoline in the intercooler and reduces the chance of carrying condensate over into the high pressure cylinders, causing trouble by cutting the lubricating oil and thus wearing out the cylinders in a short time. This trouble has been experienced in quite a few plants. Increasing the intercooler area has been known to help overcome this, as also has been the placing of a steam or oil trap or some similar arrangement in the gas line, between low-pressure accumulators and high-pressure cylinder intake."

#### PERFECT COOLING.

Perfect cooling between low and high stage compression implies cooling the gas before it enters the high-pressure cylinder to the same temperature that it had on entering the low-stage unit. Such cooling is necessary if the two stages are to use the same amount of power in compressing equal quantities of gas an equal number of compressions. As shown in Table 3, the temperature of the gas

<sup>a</sup> Peake, A. W., Personal communication.

at the low-stage intake is usually higher than at the high-stage intake. Such a condition would, if the number of compressions were equal in each stage, cause an unbalancing of power in the high and the low pressure cylinders. In compression plants with imperfect cooling between stages the work in the cylinders is allowed to take care of itself in such a way that the number of compressions in the two stages is not exactly equal. As stated in previous paragraphs, it would be better practice to cool the gas at the plant intake to as low a temperature as practicable in water-cooled coils and to use the same temperature between compression stages and in the high-pressure coils. In general, to keep the gas at the lowest practicable temperature at all times during treatment is the best practice. From the high-pressure coils and accumulators the gas passes to the field fuel lines or, if expanded gas is used to reduce the temperature still lower, it is led to the high-pressure coils cooled by expanded gas.

#### USE OF EXPANDED GAS FOR COOLING.

#### METHODS OF EXPANSION.

At many plants the gas after treatment in high-pressure water-cooled coils and accumulator tanks is further cooled, still at maximum pressure, in heat interchangers or double-pipe condensers by expanded gas. Two methods are used to obtain low temperatures

by the expansion of gas, (1) expanding the gas through a small opening or valve to a lower pressure, thus producing the absorption of heat, and (2) expanding the gas adiabatically in the power cylinders of a steam power unit, such as a compressor, pump, or drilling engine. Table 4 gives methods of expansion used at plants visited, also temperatures and pressures of the gas at the different stages of expansion and cooling.

#### EXPANSION THROUGH AN ORIFICE OR VALVE.

In the first method the high-pressure gas carrying some gasoline not removed by previous treatment is passed through either the inside or outside pipe of a double-pipe heat interchanger, and the dry gas is expanded through a small opening, such as a  $\frac{1}{2}$ -inch valve, between the pipes, thus cooling the high-pressure gas and causing further condensation of gasoline. The high pressure gas and the condensate are led to an accumulator tank, where the condensate is collected and removed. From the accumulator tank the gas passes through the expansion valve of the heat exchanger and the pressure is lowered to 10 or 15 pounds, or the pressure desired or necessary to carry the gas through the field lines. The refrigerating effect obtained by this method is surprisingly small, and although many coils using this principle for cooling have been installed, few of them lower the temperature of the high-pressure gas enough to be of material benefit. In certain standard installations one coil of this type is installed with each high-pressure unit, the inside pipe of the coil having a diameter of 3 or 4 inches, and the outside 6 or 8 inches. The length is usually approximately 80 feet, and either the straight-line or return-bend type is used. After leaving this coil the gas is returned to the field for use on the lease, or sold to commercial gas companies.

#### COILS USED IN CONJUNCTION WITH EXPANSION ENGINES.

A study of Table 5 will give the reader an idea of the great variety of types and sizes of coils used as heat exchangers or refrigerators in conjunction with expansion engines and valve expanders. The principle is the same in all types. The cold expanded gas passes through one of the pipe members of a double pipe-interchanger while the high-pressure gas from the water-cooled coils passes through the other member. At the end of the coil in which the high-pressure gas is treated, an accumulator tank or drip collects the condensed vapor as in the water-cooled coils.

Of the plants listed in Table 5, No. 6 used the smallest size of pipe to form the double-pipe coil, 2-inch pipes inside of 3-inch.<sup>a</sup> The cooling effect in this coil is rapid, but a small quantity of moisture in the gas will tend to freeze the coil and stop the flow, necessitating

<sup>a</sup> The 1 $\frac{1}{2}$ -inch in 2-inch coil mentioned in Table 5 as being part of plant 11 has been abandoned in favor of a larger double coil.

continual watchfulness and more or less thawing to do. This particular coil is protected to some extent from water vapor by first passing the gas through two other double coils, 4-inch pipe in 6-inch, which are cooled by the expanded gas from the small 2-inch in 3-inch coil. In the larger coils the gas is cooled only to such a temperature that the greater part of the liquid condensed is water. The cooling area varies between 0.15 square foot and 3.70 square feet per 1,000 cubic feet of gas treated, and averages 0.563 square foot.

79.....	do.....	1	1	4	6	80	80	84	.330

From the 2-inch in 3-inch coil the sizes range through nearly all possible combinations up to 12½-inch inside of 24-inch. As the pipe sizes become larger, cooling is slower. The cooling effect in the last-mentioned coil is so sluggish that it is doubtful whether the coil can be considered efficient. The tubular type of heat interchangers, such as are used in plants 19, 20, and 21, either horizontal or vertical, are built in the form of a tubular boiler, the cold gas being either in the main drum shell or in the tubes. This type of interchanger has not been as satisfactory as some of the double-pipe coils.

It seems that the length of time and the necessary intimate contact between the gas and the tube surfaces is not obtained, and radiation is incomplete, the high-pressure gas being discharged at too high and the expanded gas at too low a temperature. Both the high pressure and the expanded gas is thought to follow channels through the drum

and tubes and form eddies or dead spaces, leaving some parts of the tubes and shell inactive. In this type of interchanger a series of baffles in both the tubes and shell might give the desired result, as has been done in refinery practice. This type of cooler is used at a number of plants as a water condenser and as a unit in conjunction with double-pipe coils of smaller size.

The coil used at plant 7 (see Table 5 and fig. 7) is of special straight-line construction, consisting of five  $2\frac{1}{2}$ -inch pipes inside of a  $12\frac{1}{2}$ -inch casing 100 feet long. This type of interchanger is not uncommon in refinery practice, being used for the interchange of heat between oil coming from and going to stills, but in the compression-plant industry its adaptation is unique. There are 14 units of this type in the entire battery. The high-pressure gas from the water-cooled coils is divided by a header and passes in parallel through the

FIGURE 7.—Sections of special straight-line double coil.

$2\frac{1}{2}$ -inch pipes of four of the units, at the end of which it is collected by a header, and again divided in the same way, passing in parallel through the  $2\frac{1}{2}$ -inch pipes of the remaining 10 units of the battery of 14. At the end of each unit a drip (see fig. 7) collects the condensate formed.

From the discharge header at the end of the group of 10 exchangers the gas goes directly to the expansion engine. The engine exhaust, or low-pressure cold gas, is returned to the 10 interchangers, passing through them in parallel in the  $12\frac{1}{2}$ -inch shell or outside pipe countercurrent to the high-pressure gas. After passing through the 10 units the gas is collected in one main or header and is again divided and passes in parallel through the outside casings of the other four units, again countercurrent to the high-pressure gas.

By using the 14 interchangers in two sets or batteries the gas is cooled in two stages, and by the counterflow system the coldest expanded gas is brought into contact with the coldest high-pressure

gas, thus making a gradual and complete interchange of heat. The expanded gas, on leaving the battery of four coils, has been raised to approximately the temperature of the high-pressure gas from the water-cooled coils, and the high-pressure gas traversing the inside pipes is brought to the lowest possible temperature by being circulated in contact with the coldest expanded gas after it has radiated a considerable portion of its heat to the partly warmed, expanded gas in the unit of four interchangers. Of the total plant production 10.4 per cent is credited to this system of cooling. These coils are not protected by a building, but are set well above the ground and housed in wooden boxes filled with sawdust, which covers the outer pipe fully 12 inches on all sides.

Plates VIII, A, and IX show views of the coils and expansion sets taken at a plant which the writer was fortunate enough to visit shortly after the installation of the expansion engine and before the cork insulation of the pipes had been completed.

#### INCREASE IN PRODUCTION DUE TO COOLING BY EXPANSION.

In Table 6 are recorded the percentages of total production and the gravities, in °B., of the fractions of condensate collected at the different stages in accumulator tanks in plants using expansion engines and keeping records of such data. The table shows that the percentage of condensate credited to expansion units varies between 10 and 50 per cent, except at plant 76, at which all of the condensate is collected in the accumulator tank after the cooling by expanded gas is completed. This case was cited before, and is undoubtedly due to the fact that the gas is forced to travel upward through the water-cooled coils, whereas the natural flow of any condensate formed would be downward. Apparently the condensate is absorbed by the gas and precipitated later in the double-pipe interchangers cooled by expanded gas.

## FIELDS IN WHICH EXPANSION UNITS ARE USED.

In the eastern fields, where much of the gas treated contains little or no fixed or true gases, being almost entirely composed of vapors of the higher hydrocarbons, the use of extremely low temperatures is of little or no benefit, and expansion engines and coils have not, in any plant known to the writer, been installed.

Mid-Continent practice, taken as a whole, does not include expansion engines as a part of the usual installation; expansion sets are, however, being adopted by some operators building new plants at the present time as a part of the original plant design. Two plants (Nos. 32 and 33) visited by the writer in Oklahoma had expansion engines and coils in service, both being in the Glenn pool. The operators of these plants stated that of the total production 10 to 25 per cent was directly due to cooling by gas expanded in engine cylinders, as shown in Table 6. The cooling area of the double-pipe heat interchangers used in the two plants averages 0.22 square foot per 1,000 cubic feet of gas treated, which is less than one-half the average area used in California practice.

In the Caddo, Louisiana, field one company operating three compression plants uses expansion units and coils in each plant.

## EXPANSION ENGINES IN CALIFORNIA FIELDS.

The widest range of development in the installation of heat interchangers and the use of expansion engines is in California practice. At plants 3, 4, 6, 7, 9, 11, and 17 in the various California fields, 7 to 50 per cent of the total production is from expansion units, as shown in Table 6. It is generally figured in these fields that 25 per cent of the production is due to the expansion treatment. A plant in the Fullerton field treating 2,500,000 cubic feet of gas daily produced 3,000 to 3,200 gallons of condensate with a gravity of 72° B. before the expansion unit was put into operation. The expansion unit increased the daily production to between 4,000 and 4,300 gallons of condensate with a gravity of 80° to 84° B., or about 25 per cent of the total yield. The radiating areas in the heat exchangers used in California plants (see Table 6, plants 1 to 21) vary from 0.20 to 1.05 square feet per 1,000 cubic feet of gas treated daily. A radiating area large enough to warm the cold or expanded gas to the temperature, as nearly as practicable, of the high-pressure gas from the water-cooled coils is all that is necessary, because any further increase in cooling surface, the two gases being brought to approximately the same temperature, has no effect. The proper area for each 1,000 cubic feet of gas to be treated daily is a factor that can be obtained only by experiment at each plant, unless the designer has had experience in the particular field and with the particular gas

to be treated, or has data on the area used and the efficiency obtained at another plant already at work in the same field and treating the same gas.

#### TEMPERATURES OBTAINED FROM GAS EXPANSION.

The temperatures produced by heat exchange on high-pressure gas vary in practice from  $-17^{\circ}$  to  $+65^{\circ}$  F., or between  $75^{\circ}$  below and  $20^{\circ}$  F. below atmospheric temperature, as shown in Table 4 (p. 41). The best temperature to use in a given plant depends, as does the ultimate high pressure used, on the characteristics of the gas and the product desired, also on the efficiency of extraction and temperature previously obtained in the water-cooled coils. As the condensation of vapors depends on both temperature and pressure, in accordance with the physical laws of gases, at a given pressure there is some critical temperature below which it is useless to cool the gas, as Burrell<sup>a</sup> has demonstrated in the laboratory method of determining the quantity of condensable vapors in any given gas. The method of laboratory test uses only atmospheric (14.4 pounds at an elevation of 600 feet) pressure, and the extremely low temperature of  $115^{\circ}$  C. below zero, which is equal to  $175^{\circ}$  F. below zero.

At this temperature all of the propane and the butane are liquefied, which in compression practice is neither practicable nor desirable, because these two hydrocarbons are so volatile at atmospheric temperatures and pressures as cause them to weather out of plant products to a large extent, if not entirely. As a portion of each condensable hydrocarbon is precipitated and taken out of the gas, the pressure necessary to condense the remaining portion at a constant temperature rises, in accordance with the law of partial pressures. Or, with the pressure remaining constant, the temperature must be reduced to precipitate the remaining portion of that particular vapor fraction. Conversely, if at a given pressure any condensable constituent would be entirely precipitated when the gas reached the critical temperature of that fraction, the composition of the gas would be simplified and the precipitation of the other condensable fractions more complete at the same pressure. This has been demonstrated in practice in a plant using a maximum pressure of 250 pounds, and a temperature as low as  $10^{\circ}$  F. below zero at the discharge of the high-pressure coil, which was cooled by expanded gas. (See Pl. IX, A.) The condensate collected in the tank at the end of the coil contained more than 1 per cent of water; a small percentage of water was also found with the lightest condensate precipitated at the exhaust of the second stage of the expansion engine. (See Pl. VIII, B.) If water vapor is retained through all of the steps of compression and

<sup>a</sup> Burrell, G. A., and Jones, G. W., Methods of testing natural gas for gasoline content: Tech. Paper, 87, Bureau of Mines, 1916, p. 26.

cooling, as demonstrated in the plant just cited, it is probable that portions of all the hydrocarbon fractions are also. The points to be determined in any plant are the quantity of such vapors being lost and the temperature necessary to condense them as well as the value of the product and the cost of an installation to obtain the required results.

The value of the condensate obtained will depend on the quantity that can be marketed, and if excessive pressures are used, the product may be so light and volatile as to be of little value. A proper relation between pressure and temperature will in all instances yield the maximum marketable condensate from any given gas, and this relation can be found only by trials and tests made at each plant. In the plant cited above, the product obtained in the accumulator at the expansion engine exhaust had a gravity of 105° B., and probably consisted principally of butane, with small proportions of the other higher hydrocarbons and of water. The gas in this accumulator had a temperature of 40° F. below zero and a pressure of 10 pounds, as the result of the two stages of expansion. It was found that in the expansion cylinder of the engine, the gas had reached a temperature lower than 100° F. below zero before being exhausted. The quick rise in the temperature of the gas between the cylinder and the tank, which was connected to the exhaust by a short insulated pipe, is probably due to two factors, radiation from the cylinder walls and the latent heat of vapors given out on condensation.

In a plant in Oklahoma, in experimenting with expansion units, it was found that the desired low temperatures could not be obtained. So little vapor was precipitated in the coils ahead of the expansion unit that in expanding the gas the latent heat given up by the condensing vapors immediately reheated the expanding gas to 20° F. The remedy for a condition of this kind would necessarily have to be found either in the pressure or water cooling to which the gas was being subjected.

#### TEMPERATURE AND PRESSURE CHANGES IN A COMPRESSION PLANT.

Figure 8 shows diagrammatically the changes in both pressure and temperature to which gas is subjected in average compression-plant practice. The vertical coordinates show temperatures in degrees Fahrenheit for the solid line or temperature curve, and pressures in pounds per square inch for the dotted or pressure curve. The horizontal coordinates represent the different stages of treatment at which the changes of pressure and temperature occur.

#### FLOW SHEET OF A COMPRESSION PLANT.

Figure 9 shows the gas flow diagram of a 2-stage compression plant using single-stage expansion, connected with two sets of expanded-gas cooled coils in series. The gas intakes and discharges of the com-

pressors and the water-cooled coils are shown connected in manifold, this system of connections being the most flexible. With valves properly placed, any unit, part of a unit, or coil may be cut out for

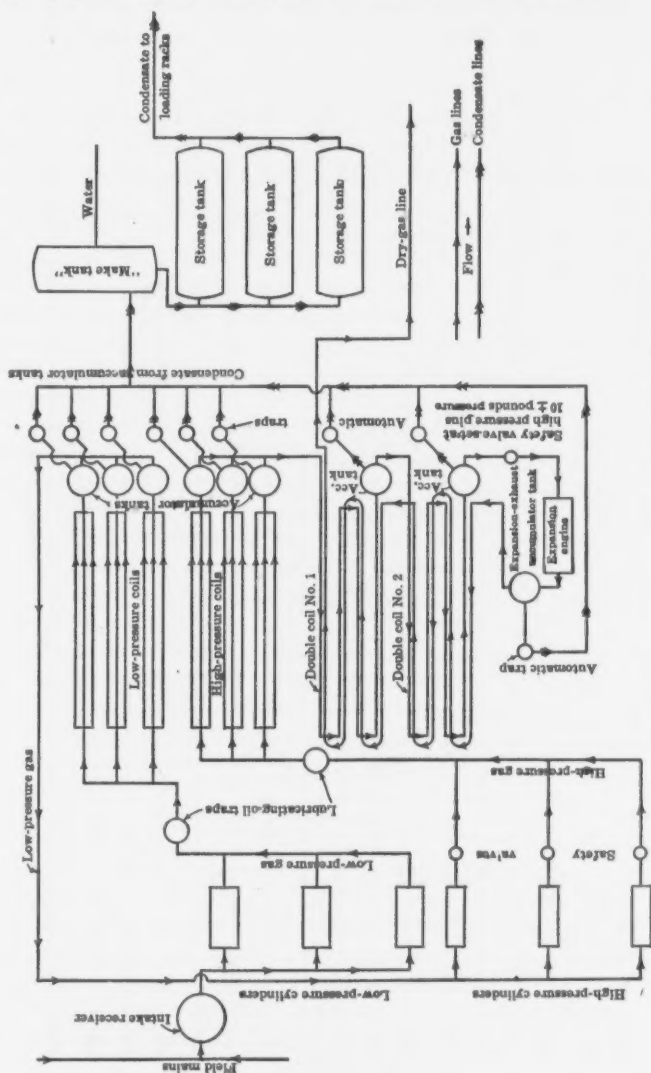

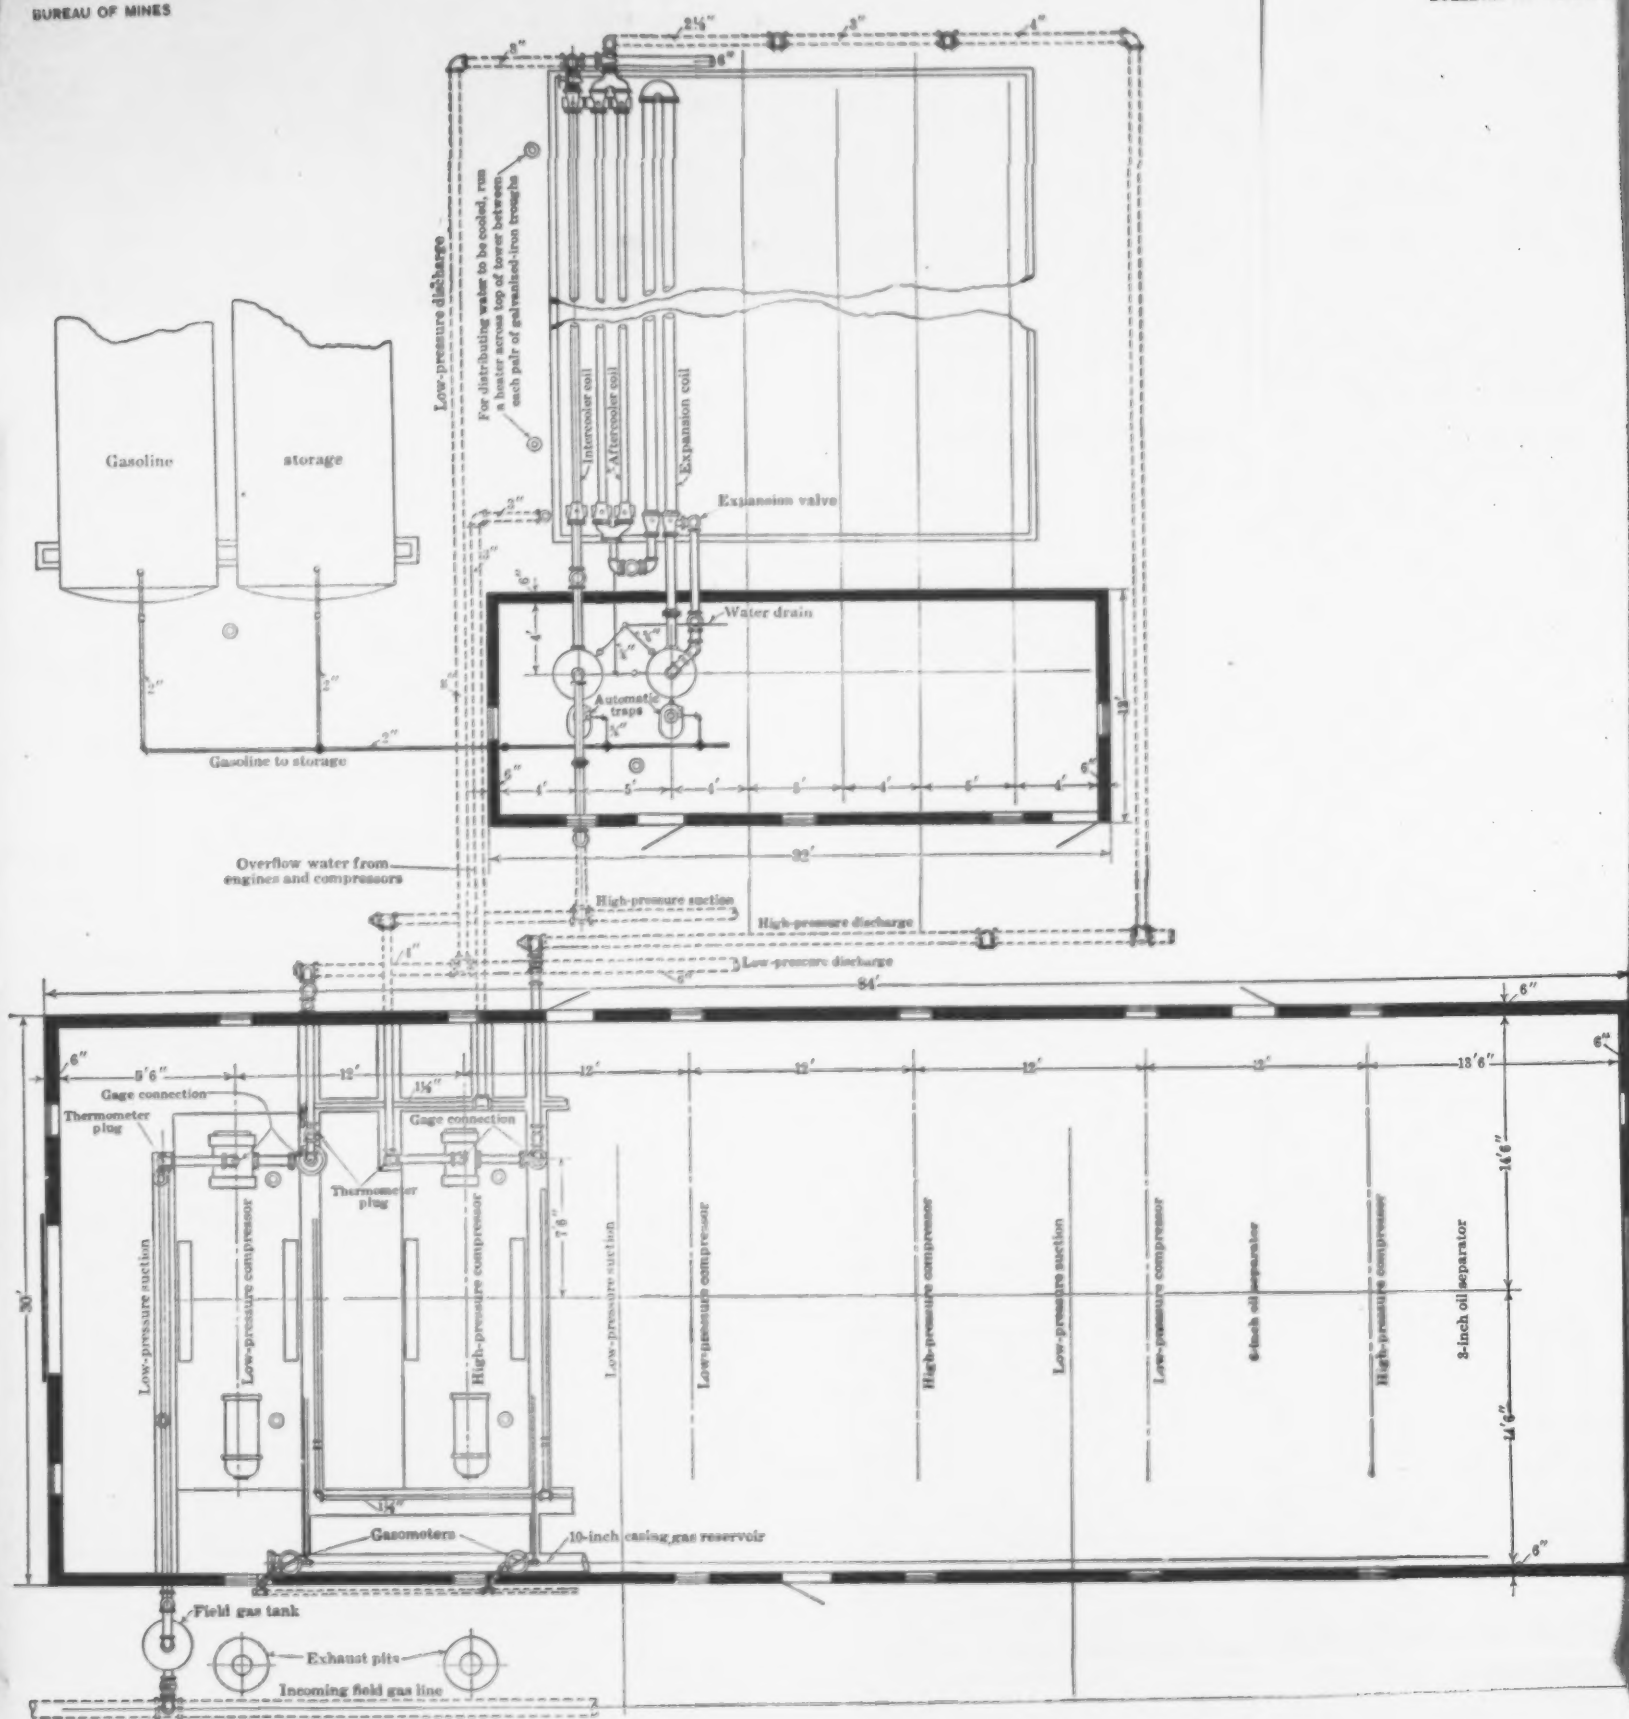

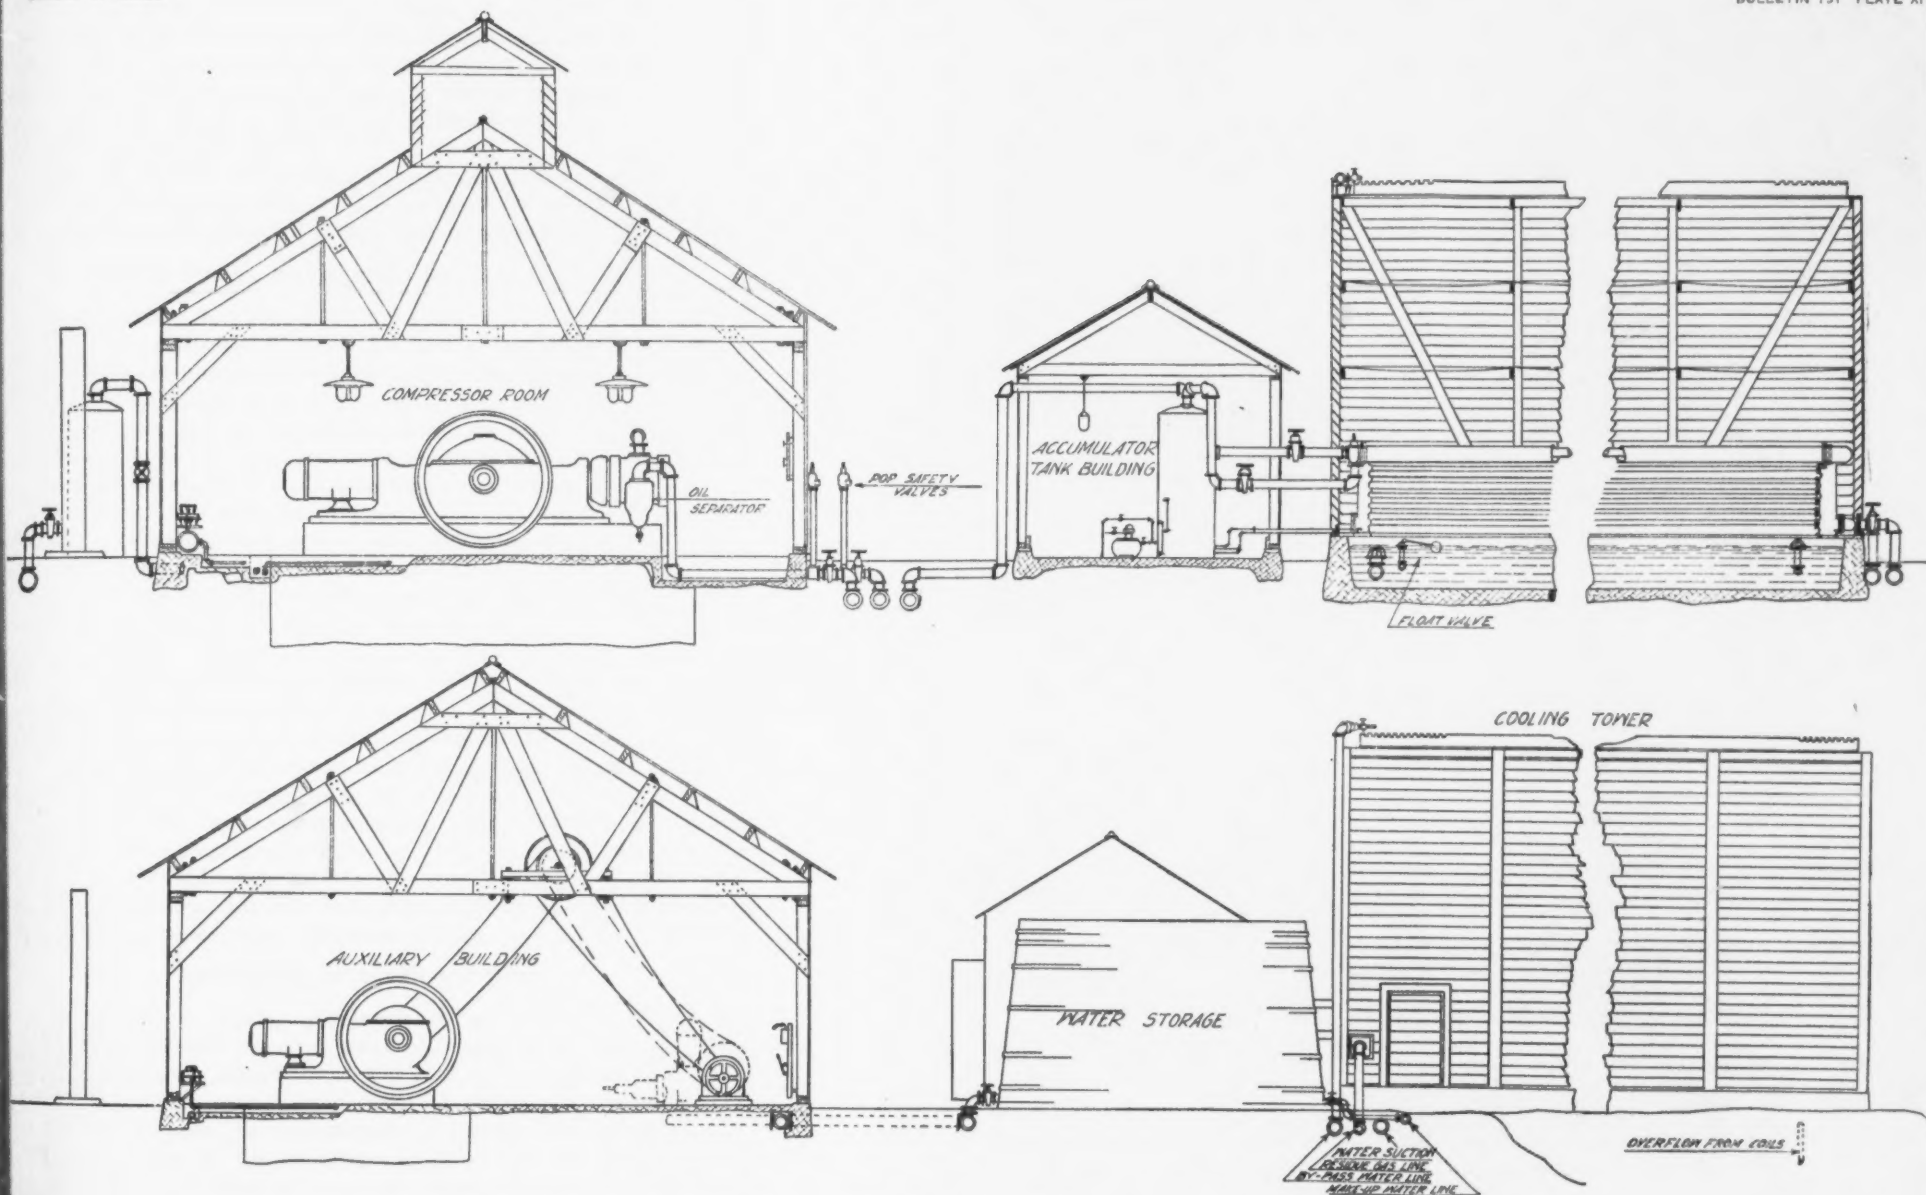

FIGURE 9.—Flow sheet of compression plant using 2-stage compression and single-stage expansion.

inspection or repairs without shutting down any other part or stopping plant operations, the work of the inactive unit being taken up by a small overload on the other units.

ELEVATION OF COMPRESSOR, AUXILIARY BUILDINGS, AND COOLING TOWER OF PLANT SHOWN IN PLATE X.

A single-stage expansion engine is shown connected with two double-pipe coils in series; if two stages of expansion were being used each of the double-pipe coils would use the gas expanded in one stage and be so connected that the gas from coil No. 1, using first-stage expanded gas, would return to the second-stage expansion cylinder, from which it would be returned to coil No. 2 to further cool the high-pressure gas.

Plates X and XI show plans and elevations of a typical direct-connected compressor plant. The low-pressure and the high-pressure cylinders are operated independently by separate gas engines.

#### USE OF POWER DEVELOPED BY GAS EXPANSION.

At all plants where expansion units are used, the development of power by the expansion of the gas has been a secondary consideration. In a number of plants power is developed only to give resistance to the expanding gas, as in a plant using a pump under a back pressure of 150 pounds, and in another plant compressing air to 40-pound pressure, only to release it to the atmosphere through a small valve set to hold the required back pressure on the natural gas.

In plant 17 the compressor end of the expansion unit holds a vacuum on the double-pipe coil and on the exhaust of the power cylinder, and delivers the gas at a pressure sufficient to return it to the lease. (See Pl. XII, A.) This use of the power developed is not uncommon, although usually the compressor suction is above atmospheric pressure. At plant 76 the power developed from expanding the gas in two single-stage cylinders working in duplex is used to compress air in two stages to a pressure of 85 pounds, to be used in air lifts in pumping oil wells. Other plants use the power generated by single-stage expansion units, as in the tandem compressor, or by two-stage expansion units, as in the cross-compound machines, to drive one of the two-stage compressor units connected in parallel with the other compression cylinders, both at the intake and the discharge. A compressor used in this way may, as at plants 6 and 14, take gas from and deliver it to the manifolds used for the intake and discharge of the other compression units.

#### EFFICIENCY OF EXPANSION UNITS.

The amount of power developed in an expansion engine as compared with the amount used in compression is very low, probably not more than 5 or 10 per cent in average plants. This condition is to be expected because of the energy loss through dissipation of heat, the consumption of power in operating the piston and valve in the expansion cylinder, and the reduction in pressure through losses of gas and vapor by condensation and leakage during transmission through pipes and cooling systems.

An exceptional instance of power developed in an expansion unit was noted at a California plant. Tests showed that between 25 and 35 per cent of the power used to compress the gas was developed by the expansion engine, which used in its power cylinders all of the gas compressed in two stages of expansion, with heating between the two expansion cylinders. The plant compressed 1,900 cubic feet of gas per minute, of which 690 cubic feet was compressed in the compressor end of the expansion engine.

The gas entering the high-pressure cylinder of the expansion engine at a pressure of 250 pounds had a temperature of 5° F. below zero; the discharge pressure was 50 pounds. The gas was then passed through double-pipe coils and heated to 50° F. before it entered the low-pressure power cylinder. From this cylinder it was exhausted at a pressure of 10 pounds and a temperature of 40° F. below zero. The gas from the second expansion exhaust was used for cooling the high-pressure gas, and was then discharged from the plant at 57° F. A measurement of the temperature in the low-pressure expansion cylinder indicated a temperature of 140° F. below zero.

If a more efficient return of power were made an object, more power could be developed by heating the high-pressure gas, after it leaves the double-pipe interchanger, in an interchanger with the hot gas from the high and the low pressure compression cylinders. If desirable the gas could be further heated in a double-pipe interchanger by the exhaust from the power cylinder of the gas engine, or in a tubular interchanger such as is used for preheating boiler water with exhaust gases.

Heating the compressed gas before it enters the valve chest of the expansion cylinder would also tend to reduce freezing at that point, thus reducing the power used in moving the valve mechanism.

To obtain as low temperatures of the expanded gas, with preheating as without preheating, more power would have to be developed and used by the expansion unit. This could be accomplished by added expansion units, by increasing the load, or by running the compressor faster at the same pressure, thus increasing the total volume of gas compressed in a given unit of time.

#### EXPANSION FOR POWER ALONE.

In expanding compressed gas for power purposes only, and not for refrigeration, as is contemplated in an eastern plant, preheating the gases by either the hot compressed gas or the engine exhaust would be necessary in order to make the installation a commercial success. Using a relatively small quantity of gas at a low temperature (60° F.) would hardly pay in power delivered, as compared with a gas engine using gas worth 15 cents or less per 1,000 cubic feet.

C. COMPRESSION PLANT, SHOWING HORIZONTAL TYPE OF "MAKE" TANKS IN MIDDLE FOREGROUND, AND OF ACCUMULATOR TANKS, AT RIGHT.

**USES MADE OF TREATED GAS.**

With the passage of the gas through the coils of the expansion unit, the treatment for recovery of gasoline is finished.

Gas used for power to run the compression plant, either in gas engines or under boilers, is universally taken from the treated gas, the rest being returned to the lease or pumped into the lines of a commercial gas company. The lease or contract usually stipulates that gas used for power in the compression plant is to be taken from the treated gas at no cost to the lessee.

**GAS USED PER HORSEPOWER IN COMPRESSION UNITS.**

The quantity of gas necessary to operate a gas engine will vary from 9 to 18 cubic feet per horsepower-hour, depending on the size, type, and age of the engine and the care given it. Boilers in a steam plant require 40 to 120 feet per horsepower hour. A plant having six 80-horsepower, direct-connected, horizontal, 2-cycle gas engines used between 12 and 14 feet. The engines had been in service two years and had been well cared for. The large 450 to 1,100 horsepower, horizontal, direct-connected, tandem, double-acting, 4-cycle units will use as little as 9 feet and the 150 to 200 horsepower, vertical, 4-cylinder, 4-cycle, belted units will use 10 to 14 feet per horsepower hour.

Oliphant<sup>a</sup> gives the following table showing the average amount of natural gas required to operate gas engines or to supply a steam-engine plant using natural gas as fuel under the boilers in cubic feet per indicated horsepower hour:

*Cubic feet of natural gas required per horsepower-hour to drive a gas engine or steam plant.*

	Cu. ft.
Large gas engine, highest type.....	9
Ordinary gas engine.....	13
Triple-expansion condensing steam engine.....	16
Double-expansion condensing steam engine.....	20
Single-cylinder steam engine with cut-off.....	40
Ordinary high-pressure steam engine without cut-off.....	80
Ordinary oil-well pumping steam engine.....	130

From 10 to 12 cubic feet of air is necessary for the complete combustion of 1 cubic foot of natural gas.

**PERCENTAGE OF GAS RETURNED AFTER CONDENSATE AND GAS USED FOR POWER IS DEDUCTED.**

The reduction in the volume of the gas from treatment by the compression process is unaccountably large. As has been stated, in treating gas from old wells that have been gas-pumped for years and are held at high vacuums, practically all of the gas disappears in one stage or another of the treatment, often not enough being left to run the engines.

<sup>a</sup> Oliphant, F. H., Catalogue of metric metal works, 1914, p. 42.

Gas produced under natural pressure in the newer fields contained a much higher percentage of fixed gases, hence the quantity of residual gas, after condensate and gas used for power have been deducted, reaches 70, or, in some plants, it is claimed, 80 per cent of the total wet gas entering the plant. Exact figures on the quantities of residual gas are seldom kept in compression plants, it being a matter of little importance in most fields. It appears, however, from the figures that the writer was able to obtain that in plants treating gas yielding  $1\frac{1}{2}$  to 2 gallons of condensate per 1,000 cubic feet the net amount of gas left after treatment and deducting gas used as fuel, would average approximately 66 per cent of the total amount entering the plant. As the gas being treated increased in gasoline content the quantity of residual gas became less and less until it was not sufficient to furnish power for compression.

#### GAS USED FOR POWER AND TO FORM CONDENSATE.

Between 10 and 15 per cent of the total quantity of gas treated is required for power purposes, depending on the type and the efficiency of the engines driving the compressors. Burrell<sup>a</sup> states that it takes, on an average, 35 cubic feet of vapor to produce 1 gallon of condensate, or 3.5 per cent for each gallon produced from 1,000 cubic feet of gas, or if 3 gallons of unweathered product is made it will account for 10.5 per cent of the total gas entering the plant. The condensation of water vapor during the treatment will also account for a certain percentage of the total volume. The gas and vapor unaccounted for in the ways noted must be lost by leakage in pipes and machines during the various stages of plant operation, and by weathering of light fractions.

#### FOREIGN CONSTITUENTS IN NATURAL GAS.

##### AIR.

Besides water vapor, a number of gases not of the hydrocarbon groups are often found in natural gas. Air, if present, may be a constituent of gas from wells under high vacuums, but is usually due to inward leakage, either in the well casing or in lines transmitting the gas to the plant. At a plant visited in the Shallow pool of Oklahoma, the writer was informed that the gas being treated contained 30 per cent air. The area from which the gas was being drawn covered 12 square miles, making the use of long gathering lines and many vacuum pumps necessary, which probably accounts for the extremely high air content.

<sup>a</sup> Burrell, G. A., Seibert, F. M., and Oberfell, G. G., The condensation of gasoline from natural gas. Bull. 88, Bureau of Mines, 1915, p. 60.

**WATER VAPOR.**

Air always carries more or less water vapor with it, and this fact may account for part of the water precipitated with condensate. As most oils carry some water with them from the oil-bearing formations, it is natural to believe that some water vapor from this source would be carried into the gas, especially when the wells are being gas-pumped and low pressures maintained. The temperature of the oil and water under ground would also tend to allow water vapor to form and be held in the gas. In one instance, the oil coming from a certain well also producing gas had a temperature of 150° F. in the flow lines.

A California plant treating 2,500,000 cubic feet of gas daily produced water with the condensate at various points as follows:

*Gallons of water drained from various points at California plant in 24 hours.*

	Gallons.
From low-pressure accumulator.....	200
From high-pressure accumulator.....	50
From final double-pipe coil.....	25
From storage tank.....	65
Total.....	340

This quantity of water was equal to between 5 and 6 per cent of the condensate produced.

**CARBON DIOXIDE.**

The proportion of carbon dioxide in natural gas used in compression plants varies widely. As much as 30 per cent has been found in both the Mid-Continent and California fields. So large a proportion is unusual, but percentages up to 10 are not uncommon in California fields, and in some districts in Oklahoma.

Nitrogen is found in the natural gas in some districts, as noted by Burrell,<sup>a</sup> but was not found in gas fields visited and sampled by the writer, except as introduced into the gas with air.

**SULPHUR COMPOUNDS.**

Hydrogen sulphide or other gaseous sulphur compounds, usually called "sulphur gas," is found in many of the fields producing casing-head gas. However, only the gas from small areas of these fields contains sulphur in such quantities as to be a decidedly detrimental factor in treatment of gas for its gasoline content.

Plants in the southern Illinois field are troubled by sulphur compounds more generally than those in any other district as a whole. A plant in the Santa Maria and one in the Salt Lake field in California report sulphur trouble, but such contamination is local and is not characteristic of those fields as a whole.

<sup>a</sup> Burrell, G. A., Selbert, F. M., and Oberfell, G. G., The condensation of gasoline from natural gas: Bull. 88, Bureau of Mines, 1915, pp. 21-22.

**GENERAL EFFECTS ON COMPRESSION TREATMENT.**

The gases named, with the exception of hydrogen sulphide, are inert chemically through all the stages of the compression process. Physically they affect plant practice in two ways. They cut down the volume of productive gas treated or absorb power for which no return is possible; they complicate the problem of partial pressures by requiring higher pressures for the gas as a whole in order to bring any one of the condensable fractions to its critical pressure, thus again necessitating more power.

**EFFECTS OF SULPHUR AND METHODS OF REMOVAL.**

In the Lawrenceville district of southern Illinois the proportion of sulphur in the natural gas is so large as to be a decided detriment to treatment by compression. Beside destroying the pipes in cooling coils, so much of the hydrogen sulphide is dissolved in the condensate, either as a gas or as a liquid, that resort is had to steam distilling in order to free the condensate from this objectionable content. The odor of even small proportions is noticeable, making the product unsalable, and such gasoline, if used in motors, will attack the pistons and cylinders, causing pitting and roughness. By use of the steam stills in that district between one-third and one-half of the total plant product is lost as noncondensable vapor passing through the cooling coils after the stills.

The two California plants, mentioned previously, report no trouble with sulphur in the condensate, but do have trouble from the sulphur gas attacking and eating out cooling coils. At the plant in the Salt Lake field 2-inch steel pipes will often be eaten through, particularly at a low point in the coil, in 3 or 4 months. The plant in the Santa Maria field found that 2-inch steel pipe, costing 12 cents per foot (May, 1916), in the cooling towers lasted 6 months, and that wrought-iron pipes, costing 19 cents per foot at that time, lasted 13 months or more.

No compressor or engine trouble traceable to hydrogen sulphide gas was reported at any of the above plants, possibly because of the film of lubricating oil constantly protecting the pistons and cylinders.

The elimination of sulphur gas has long been a part of the treatment for purifying manufactured or artificial gas. The artificial gas made from coal or oil is passed through a scrubber containing iron oxide (common hematite iron ore). A chemical reaction takes place, the sulphur uniting with the iron to form iron sulphide, which is a solid at normal temperatures, thus removing the sulphur from the gas. When the iron becomes slow in its action, or so largely converted to the sulphide as to be inefficient in removing the sulphur, it is discharged and a fresh charge placed in the scrubber. The scrubbers are generally operated in pairs to allow one to be cut out

during periods of cleaning and charging. The discharged iron ore is thrown out on the ground, where it is oxidized by the action of the sun and the atmosphere, and again used as a fresh charge for the scrubbers.

The sulphur compounds originating in gas act chemically as an acid in much the same way as the acid fumes that are carried in still vapors in oil refining.

An eastern refinery which compresses the uncondensed still vapors and gases to further remove condensable fractions uses a series of water and caustic washes in scrubbing tanks to remove acid impurities, as described on page 68.

To overcome the action of sulphur gas which was eating out the high-pressure coils of a compression plant, Mr. D. L. Newton, general superintendent of the Hurley Smith Gasoline Co., of Los Angeles, Cal., designed and successfully operated a scrubber and cooler combined which removed the objectionable gases and also took the place of the high-pressure water-cooled coils.

Figure 10 shows the general design and method of operation of the scrubber. After this treatment the gas was refrigerated in double-pipe coils of usual construction without causing their destruction or forming incrustations of sulphur compounds.

The following data, regarding the operation of the scrubber, was also kindly furnished by Mr. Newton:

*Data on scrubber for removing sulphur.*

Capacity, 300,000 cubic feet per day at a pressure of 250 pounds.

Temperature of gas entering scrubber, 190° F.

Temperature of gas leaving scrubber, 78° F.

Temperature of water entering scrubber, 72° F.

Temperature of water leaving scrubber, 78° F.

Volume of water used per 24 hours, 15,000 gallons.

The water used in the scrubber, after being automatically trapped from the separator, was returned to the top of the cooling tower for cooling in the usual way. Owing to aeration and the lowered pressure, the greater part of the sulphur gas passed off into the air, the cooled water being returned to the scrubber by a pump at a pressure slightly higher than that at which the gas entered the scrubber.

### CONDENSATE.

#### LINE DRIP.

The first condensate produced in treating gas by compression is the small quantity of rather heavy and often discolored naphtha accumulating in the pipe-line drips. After this condensate has been collected and cleaned by filtering or distilling it is mixed with the balance of the plant product, giving the mixture a lower gravity and vapor tension and helping to stabilize the "wild" condensate from other parts of the plant.

FIGURE 10.—Scrubber used to cool gas and remove sulphur compounds.

**CONDENSATE FROM LOW-PRESSURE COILS.**

The second condensate is that collected in the low-pressure accumulator tanks; its proportion to the whole product varies between nothing and 50 per cent, and in average plant practice between 10 and 30 per cent. The gravity varies around 60° B. and the vapor tension between 1 and 3 pounds. Such condensate makes an ideal motor fuel just as it comes from the coils, but is usually mixed before leaving the plant with the other products either in "make tanks" or in storage tanks, having the same tendency as the line drip to improve the product as a whole.

The following distillation represents approximately an average first-stage condensate as produced in California practice:

*Results of fractional distillation of first-compression naphtha (condensate).*

[Analyst, Paul W. Fritzman.]

4.....	50	218	63.1	10
5.....	50	228	60.8	10
6.....	50	241	58.4	10
7.....	50	254	56.5	10
8.....	50	272	54.8	10
9.....	50	312	51.4	10
.....	16	352	.....	.....

Total amount distilled off and collected, 466 c. c.; final temperature, 352° F. Loss, 8 per cent.

Eastern or Mid-Continent products with these end points would have a specific gravity between 5° and 9° B. higher, but the sample distilled is fairly representative of the first-stage product of two-stage plants.

**CONDENSATE FROM HIGH-PRESSURE COILS.**

Next in the series of condensates collected is that obtained from the gas under the maximum pressure used in any given plant and at temperatures developed by water cooling.

In average plant practice the condensate precipitated and collected at this point represents the principal bulk of the total recovery, seldom being less than 30 per cent of the total product even in plants using expansion units, and at times reaching 100 per cent, as in all single-stage practice and in some two-stage installations. At plant 22, which compressed the gas to 300 pounds in two stages and cooled it to 60° F. in the high-pressure coils, all the condensate was produced at this point, the product having a gravity of 96° B.

The specific gravity of the high-stage condensate is between 65° B. and 100° B., averaging in eastern fields approximately 85° B., in Oklahoma 78° B., and in California 72° B.

As formed in the accumulator tank this condensate is "wild," owing to the absence of low-gravity fractions, to dissolved gas, and to hydrocarbons that can be held as liquids only under high pressure at the temperatures attained in the water-cooled coils. As the pressure is reduced by the automatic traps or in the transfer from accumulators to the "make" or storage tanks, the lighter fractions and dissolved gases immediately start coming off and build up pressure in the tank containing them or escape to the atmosphere. For these reasons the condensate from high-pressure accumulators is usually discharged to tanks containing the heavier fractions precipitated in other coils and is often blended in there, or before it reaches the storage tanks.

#### CONDENSATE FROM EXPANSION COIL.

Table 6 (p. 45) gives the gravity and percentage of this condensate as obtained in plants using expansion units. The condensate has much the same physical characteristics as the condensate from high-pressure water-cooled coils and is handled and treated in the same way.

#### CONDENSATE FROM EXPANSION EXHAUST.

As stated and discussed under expansion units, plant 6 collects a high-gravity (105° B.) condensate in an accumulator close-connected to the exhaust of the second-stage expansion cylinder. This condensate is stored separately and held under pressure until blended with large quantities of 48° B. naphtha.

At the plant shown in Plates VIII, A (p. 46), and IX, A (p. 47), the condensate collected in the expansion-exhaust accumulator tank is mixed with the balance of the plant product and the mixture is shipped, without blending, by auto trucks.

#### CONDENSABLE HYDROCARBON FRACTIONS IN NATURAL GAS.

From these data and from points previously brought out, it appears that different natural gas from different fields containing the same quantity of condensable vapors seldom contains the same percentages of the various hydrocarbon fractions entering into the composition of gasoline.

This, in part at least, explains the wide variation in the gravity and amount of product obtained under similar conditions of temperature and pressure in different plants treating gas from different parts of the same field or from different fields.

From the study made by the writer of the conditions as found in fields throughout the United States, the explanation seems to lie in

any one, or a combination, of three conditions—the fractional composition of the gasoline content of the oil from which the gas comes, the temperature of the oil, and the pressure on the oil at the time of releasing the vapors to the gas.

Under the first condition, as demonstrated by refinery results and fractionations, it has been shown that distillates of the same gravity and the same or different end points vary widely in the content of the different fractions obtained between the same temperature limits. The oil containing only certain fractions of the light hydrocarbons can give up only these fractions to the gas, regardless of the temperature or pressure.

As the temperature of the oil varies in different fields and at different localities and depths in the same field, the factor of temperature must bear directly on the fractions of distillates contained in the gas. At constant pressures and temperatures only certain of the fractions will vaporize and be carried into the gas, leaving other fractions as liquids with the oil.

In any oil field, rock pressures decline as the supply of gas and oil is reduced. As the boiling or vaporizing temperatures of liquids are lowered by reduced pressures, this condition of lower pressures allows the less volatile, heavier fractions to vaporize if the temperature remains constant, thus adding to the gasoline content of the gas. As the rock pressure becomes low and the rate of decline so slow as to be practically stationary, and vapors no longer distill naturally from the oil left in the ground, resort is had to vacuum pumps to increase the flow of oil and gas, thus permitting the vapors to distill from the oil in the sands. Under this method is produced the gas of which the greatest proportion is condensable, as in eastern compression practice.

The widely varying conditions under which casing-head gas obtains its charge of condensable vapors, the variable content of lighter hydrocarbons in the oil in the ground, and the direct effects of the law of partial pressures on the products precipitated at the different stages in plant practice will to no small extent account for the great differences in plant practice as to pressures and temperatures used, and also for the variations in the percentage and gravity of the condensates of successive plant stages and the gravity and vapor tensions of the product of plants in different fields.

#### VARIATIONS IN PLANT PRODUCT.

The quantity and the gravity of condensates from different plants is shown in Table 2 (p. 29). These figures represent the average quantity and the average gravity, but both vary considerably from day to day and month to month. Many theories have been advanced to account for these variations, but none of them is satisfactory in analyzing the variations as they actually occur in plant production.

From the known effects of temperature on gas containing condensable vapors, it is reasonable to believe that atmospheric conditions, changing as they do with the seasons, explain in part the differences noticed from time to time in the yields from the different stages and in the total plant output. Many operators state that a larger proportion of condensate of higher gravity is collected in the low-stage accumulator tanks in cold weather. This same result is noticed also in the quantity and gravity of "line distillate" precipitated in gathering systems and collected in the line drips. In many plants the total production increases in winter, but this is not always true, as in plants using low temperatures, produced by expansion engines. It is often found that cold weather condenses some vapor in the gathering lines, and unless this is collected and added to the total an actual decrease in plant production results. It has been shown by several records of plant production that the yield decreases on a cold day and increases to a point well above the average on the first warm day after a period of cold weather. A plant in a hot climate on keeping records of the variations in production and attempting to determine the factors concerned, found that in general the production usually varied from day to day with the temperature, but at times varied in the opposite direction. The operators believed that the cause was to be found in a combination of atmospheric conditions, including temperature, barometric pressure, and humidity, which undoubtedly would affect evaporation and cooling of water used either in towers or sprays. To what extent these conditions control the production or account for the variations in it, it is not possible to say.

Another plant that had been treating the same quantity of gas daily from the same wells for nearly three years suddenly increased its production from 5,200 to 5,900 gallons per day, averaged over a period of one month, no changes having been made in plant practice. The operators believed that the increase was due to some change in underground conditions that permitted the gas to be enriched. Exceedingly careful records have been kept at this plant, and these show that the daily production usually varied between 100 and 300 gallons. The sudden increase of 700 gallons daily over a period of one month has not been satisfactorily accounted for. The gravity of the condensate remained constant.

Usually the gravity of the total plant product increases in cold weather, owing to the separation of part of the heavy fractions in the gathering lines and to the condensation of lighter fractions in the water-cooled coils.

It appears that a satisfactory explanation of the causes of variation in production will not be arrived at until complete records of the variations in yield and gravity of the condensate, in the tem-

peratures and pressures used, and in atmospheric conditions are kept at different plants so these data can be studied with reference to each other and a comparison made of the results obtained at a number of plants in different fields and under different climatic conditions.

## THE USE OF AMMONIA AS AN AUXILIARY COOLING AGENT.

### DESCRIPTION OF PLANT IN FULLERTON FIELD.

A detailed description of plant 2, which is situated in the Fullerton, California, field follows: The casing-head gas being treated in the plant is brought from 20 oil wells through 3,500 feet of 2, 4, and 6 inch lines, 2-inch lead lines from the different wells being connected with the main gathering lines of 4 and 6 inches diameter.

The 6-inch main discharges the gas at the plant into a 6-foot by 10-foot steel receiver which also acts as a scrubber and accumulating tank for "line distillate," removing from the gas the crude oil, the condensate formed in the pipe lines, and dirt. The receiver is connected to a single-stage, 40-horsepower, noncondensing, direct-connected air compressor with 12 by 16 by 12 inch cylinders. The compressor is steam driven, rate 200 revolutions per minute, and takes steam at a pressure of 110 pounds. The compressor holds on the intake receiver a 10-inch vacuum that brings the gas through the pipe lines from the well, but is practically dissipated by friction and leakage, leaving the pressure at the wells at or near zero.

### REFRIGERATION "STILLS."

Seven "stills," or coil heat interchangers are used in cooling the gas. (See fig. 11.) Each still consists of 1,260 feet of 1½-inch, extra heavy pipe coiled, with return bends, inside of a 12-inch tube 80 feet long laid at a slope of 1 inch in 10 feet, or 8 inches in all, to collect the condensate at one point, thence it is drained into storage or "make" tanks. The seven stills are parallel with one another, all draining in the same direction. Four of the stills, in which ammonia is used as the refrigerant, are insulated by about 1 foot of sawdust contained in a wooden housing about the tube; the other three coils, which treat the hot gas from the compressor, are not insulated and are exposed to the air, the hot gas flowing in the 12-inch tube and the cold gas in the 1½-inch coils.

The compressor discharges the gas at a pressure of 37 pounds and a temperature of 150° F. into stills 1 and 2, connected in parallel. These stills discharge into the outer tube of still 3, the gas from this still flowing through the outer tube of each of the other stills in succession. The dry, cold gas from still 7, in which the lowest temperature, approximately 10° F., and the final precipitation of condensate are obtained, is discharged into a pipe which returns it to the 1½-inch

coils of stills 1, 2, and 3. The gas is divided equally between the three coils of these stills, flowing through them in parallel, thence it discharges into a header connected with the field, or "dry-gas," lines carrying it back to the various leases.

## TEMPERATURES OBTAINED.

The following table gives the average temperature of the gas as it enters each of the stills; also the average gravity of the condensate discharged at the low end of each still. The gravity of the mixture of the entire product from all the stills averages 76° B.

FIGURE 11.—Flow sheet of compression plant in Fullerton, California, field.

*Temperature of gas and gravity of condensate from each of the seven stills.*

	Temperature of gas in each still, °F.	Gravity of condensate, °B.
Stills 1 and 2.....	150	62
Still 3.....	75	65
Still 4.....	50	73
Still 5.....	40	78
Still 6.....	30	85
Still 7.....	10	95

#### COOLING SURFACE.

In each still the 1,260 feet of 1½-inch pipe exposes a radiating surface of 412 square feet to the wet gas being refrigerated in the 12-inch tube, or 2,884 square feet in the entire set of seven stills. Of the 2,884 square feet of surface area, 1,648 feet are cooled by ammonia in stills 4, 5, 6, and 7, and 1,236 feet by cold, dry gas in stills 1, 2, and 3 that has passed through the entire set of refrigerating tubes, giving a total of 8.24 square feet of cooling surface for each 1,000 cubic feet of gas treated per day.

#### COLLECTING CONDENSATE.

The condensate from each still is drawn off continually from the bottom at the low end through a 1-inch pipe manifold to a cone-bottom settling tank in which the gasoline and the water separate by gravity, the water being drawn off at the bottom and the condensate flowing to the storage tanks. The 1-inch manifold and the bottom of each still are connected by a ½-inch gage glass through which the condensate precipitated in that still flows, allowing the operator to see at all times the flow of condensate before it is mixed with that of other stills. By this arrangement he can note, without stopping the plant, whether any discolored condensate is being discharged, or whether any one of the stills is not working properly.

#### AMMONIA CIRCUIT.

The ammonia used in refrigeration is compressed in the duplex compression cylinders of a 30-ton Stevens ice machine, direct-connected to a 125-horsepower, tandem-compound, steam-driven Corliss engine, with 10 by 20 by 12 inch cylinders taking steam at 110 pounds and operating at 80 revolutions per minute.

From the compression cylinders the ammonia gas is discharged at a pressure of 150 pounds to the inside 1½-inch pipe of a double-pipe water-cooled coil, the water circulating through the outside 2-inch pipe. This coil unit consists of three sets of double-pipe return-bend coils eight pipes high and 20 feet long. Water circulated by a centrifugal pump flows from the coils over a cooling tower, collects in the tower basin and is returned to the coils by the pump at a temperature somewhat below that of the atmosphere. From the inside coils the ammonia flows through a ½-inch pipe to a receiver or storage tank,

made of 8-inch casing 15 feet long, thence through an expansion valve to the four stills, connected in parallel as described above, at a pressure of 15 pounds and a temperature of 10° F. The ammonia is discharged from the four stills into a pipe manifold leading to the ammonia compressor, to be returned through the circuit. Ammonia lost in the pipes and stills by leaks and breaks is replaced from time to time from a steel bottle of compressed ammonia connected to the ammonia circuit as indicated in figure 11.

#### DESCRIPTION OF PLANT IN SANTA MARIA FIELD.

Plant 10 uses ammonia as an auxiliary cooling agent in addition to water cooling and expansion cooling. At this plant the gas passes through water-cooled coils after each of the three stages of compression, then through a coil cooled with brine refrigerated by ammonia from an ice-making machine, and then through double-pipe coils cooled by expanding gas.

The gas, after being cooled in the high-pressure (250 pounds) water-cooled coils, is led through a continuous coil of 4-inch pipe 450 feet in length, inclosed in a wooden tank or basin built with double walls and bottoms, 9 inches apart, the space between the walls being packed with sawdust. This coil is cooled with brine. The tank bottom has enough slope to drain the brine toward one end, whence it is pumped for recirculation through the unit. The brine (calcium-chloride solution) is brought in contact with the expanded ammonia by the use of coils in an iron tank, reducing the temperature of the brine to about 32° F. From this cooling tank the brine is circulated by a centrifugal pump to the gas-cooling coils, where it is discharged in such a way as to drip over the coil and collect at the low end of the basin, to be discharged again to the ammonia-cooled brine tank.

The gas discharged from the brine-cooled coils has a temperature of 32° to 34° F. The advantage claimed for this system is that the temperature produced by the brine cooling precipitates all the water vapor in the gas, thus preventing freezing of the double-pipe coils cooled by gas from the expansion engine. This is without doubt an advantage to be desired, but it could probably be obtained in this plant, as in other plants, by a more thorough use of expanded gas in coils of greater length and smaller diameter, or by using the expanded gas in two sets of coils and cooling the high-pressure gas in two stages, the first stage using the expanded gas from the second-stage coils. The first coils being partly warmed, would precipitate only water if the temperature were properly adjusted as is done in other plants described. The ammonia compressor and coils, also the brine circulating pumps, coils, and cooler could be abandoned, and only the extra set of expansion coils put in to replace them.

The brine and ammonia cooling installation is cumbersome, inefficient, and requires more time and care than the result warrants.

## TREATMENT OF STILL VAPORS BY COMPRESSION AT A REFINERY IN NEW JERSEY.

### VAPORS TREATED.

The gases treated in the compression plant, designated as plant 80 in the tables, at a refinery in New Jersey are those from all cooling coils in which the lighter fractions of crude oil and naphthas from both fire and steam stills are being condensed. Figure 12 shows (at the extreme left) the condenser box and coils from which the uncondensed gases and vapors treated by compression originate. From that point each unit and process is shown diagrammatically to the point at which the condensate and fixed gases are finally separated

### COLLECTING VAPORS.

At the discharge pipe of the coils in water boxes a T connection is made, the condensate flowing down into pipes connected with the "tail house" and "look boxes"; the gases and vapors rise through a vertical pipe 6 feet high to the 8 or 10 inch collecting pipe called the gas main. The gas main is also connected with a 2-inch pipe to the condensate line at a point about 2 feet back of the look boxes, and with a 2-inch pipe leading from the top of the look boxes, both of which are used to relieve the pressure and collect vapors that have been carried past the first stage of separation, or have formed in the condensate flow lines. From the top of the gas main the gas is led through 12-inch pipe connections past a butterfly valve, which regulates the vacuum held on the discharge pipes of the condenser coils, to a vertical steel receiving tank 15 feet in diameter and 18 feet high. In this tank the gas is given a preliminary scrubbing with sea water, removing part of the sulphur compounds, some heavy oils which have been carried through the stills, and a small quantity of discolored condensate of approximately 53° B. gravity. The 12-inch pipes leading to the receiver are taken out at the top of the gas main, instead of the bottom, so as to trap back any condensate formed in the main and allow it to flow down the 6-foot risers and back into the lines from the coils to the tail house with the rest of the condensates produced. The vacuum held and regulated by the butterfly valve, previously referred to, on the gas mains and on the discharge of the condenser coils is between 0.25 and 1 inch of mercury (2 to 8 ounces below atmospheric pressure). There is no gage between the butterfly valve and the blower that produces the vacuum, so no record of the pressure between these points is available. However, the writer was informed that a test had been made that showed a vacuum of 22 inches of mercury.

## SCRUBBING PROCESS.

From the receiving tank a 12-inch pipe carries the gas to a size 8 positive-pressure Root blower which holds the vacuum on the re-

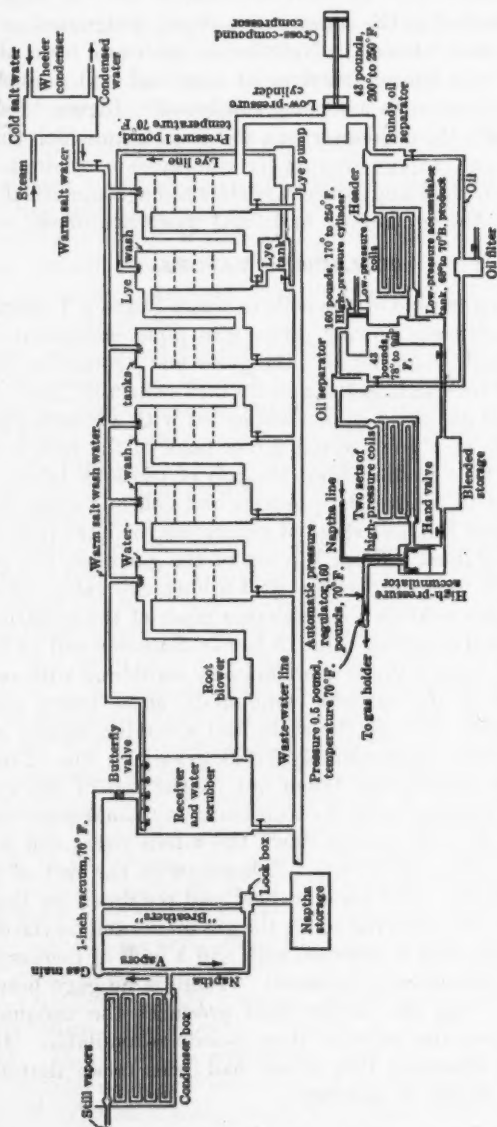

FIGURE 12.—Flow sheet of compression plant at a refinery in New Jersey.

ceiving tank and the gas mains and delivers the gas at a pressure of one pound to the scrubbers and the low-pressure compressor beyond

the scrubbers. From the blower the gas passes through six 4 by 20 foot vertical iron scrubbers connected in series. The connections are so made that by opening or closing valves, the scrubbers may be operated as two sets, in parallel, of three tanks connected in series. This arrangement was tried and abandoned in favor of the series of six. In each scrubber the gas enters at a point about two feet above the bottom, passes a series of wood baffles over which warm wash water or caustic solution is falling, and discharges at the top. The gas then passes through the next scrubber in the series.

In the first four scrubbers warm sea water, flowing over baffles countercurrent to the gas, is used to remove impurities, consisting chiefly of sulphur and sulphur compounds, from the gas. In the fifth scrubber a solution of sodium hydroxide (lye) with a specific gravity of 12° B. is circulated over the wood baffles, in the same manner as the water in the other tanks, to remove any acids contained in the gas. These impurities may originate either in the crude oil or in the refining of the various distillates from which vapors are taken for treatment by compression. The lye used, as received at the refinery from the manufacturer, is a 35° to 40° solution. It is transferred to one of four iron storage tanks and diluted to the strength used in the scrubber. After being circulated until it will not neutralize the acid in the gases and becomes foul, it is wasted and fresh solution is put into circulation.

In the sixth scrubber warm salt water is used to remove any traces of caustic remaining in the gas. Caustic in the gas would react with the lubricating oils in the compressor cylinders, causing cutting of the cylinders or an excessive waste of oil.

The gas in passing through the six scrubbers is warmed 2° to 5° F. by the warm water used as the scrubbing medium. This warm salt water is the discharge from the Wheeler condenser used in connection with the low-pressure steam cylinder of the compressor. The fact that the water used is salt has nothing to do with the process. Sea water is used because it is the most available, the plant being situated on the Atlantic coast. No condensate is formed during the scrubbing. This would be anticipated because of the increased temperature of the gas due to the use of the warm condenser water. Both the water and the lye solution circulated through the scrubber tanks are handled by duplex pumps.

#### COMPRESSION AND COOLING.

From the sixth scrubber the gas is delivered at a pressure of 1 pound and a temperature of 70° F. to the low-pressure cylinder of the compressor, which discharges it at a pressure of 43 pounds and a temperature varying between 200° and 250° F.

Gas discharged from the low-pressure cylinder to the intermediate cooling coils is passed through a Bundy oil separator, which removes

lubricating oils carried over with hot gas and gasoline vapor from the compressor cylinder. The coils used are the water-cooled type submerged in a box, typical of refinery construction. The gas is divided in a header into six sets of return-bend coils of 3-inch pipe 10 feet long and six pipes high, totaling 360 feet of 3-inch pipe, exposing a radiating surface of 283 square feet, or 0.189 square foot per 1,000 cubic feet of gas treated per day. This is approximately one-third of the radiating area usually found in compression plants for the same service.

At the bottom of the coil the gas is again collected through a header and discharged into an accumulator tank in which 750 to 1,000 gallons of condensate is collected each day. The condensate varies in gravity according to weather conditions, averaging 68° B. in summer and 72° B. in winter. The product collected in this accumulator tank is forced into storage tanks by the working gas pressure as often as necessary and blended with the rest of the condensate. The gas leaving the coils has a temperature of 70° to 90° F., the high temperature probably being due to the small cooling area used at this plant.

At this temperature and pressure (70° to 90° F. and 43 pounds) the gas enters the high-pressure cylinder and is discharged at a pressure of 160 pounds and a temperature between 170° and 250° F. The gas is again led through a Bundy trap to separate lubricating oils, as previously described, and then to the high-pressure cooling coils, which are the same size and length as the intermediate coils used to cool the low-pressure gas, except that two sets are used in series in place of one, having twice the cooling area. The average temperature to which the gas is reduced in these coils is 70° F. and is the lowest temperature used in the treatment.

After the condensate and gas have been separated in the high-pressure accumulator tank the pressure is reduced through a valve to one-half pound and the gas discharged to a gas receiver in which gas is stored and used for fuel under boilers, stills, etc., in the plant.

#### BLENDING.

Blending at this plant is all done under a pressure of 160 pounds in the high-pressure accumulator tank, as follows:

Naphtha with a gravity of 53° B. is pumped through 1½-inch pipe in coil boxes and cooled to 70° F., then into the top of the high-pressure accumulator tank, and sprayed through the rising gas at a rate which gives a mixture containing approximately four parts of naphtha to one of condensate, or about 80 per cent naphtha. At regular intervals the mixture is drawn off into another tank containing the low-stage condensate, and the resulting mixture sampled and tested for gravity. If the gravity is found to be too high, more

naphtha is pumped into the accumulator tank, which lowers the gravity of the next batch drawn off into the storage tank and of all the blend in storage, or if the gravity was too low the proportion of naphtha pumped into the accumulator is cut down. From 4,000 to 5,000 gallons of raw condensate is made daily in the high-pressure coils, and this with the condensate from the low-pressure coils makes a total production of 5,000 to 6,000 gallons per day from treated gases and vapors. The raw condensate from the high-pressure coils has a gravity varying between 76° and 93° B. After blending with naphtha, the product has a gravity of 58° to 61° B.

The level of the mixture in the high-pressure accumulator tank is at all times kept above the discharge pipe from the coils, thus forcing all the gas to pass through the blended product. It is claimed that this method adds 250 to 500 gallons daily to the net production. Inasmuch as the blend is four parts naphtha to one of condensate, and the temperature of the gas in the coils is such as to leave part of the comparatively heavy gasoline fractions uncondensed, absorption of liquids from the gases or absorption of the gases themselves may reasonably take place. The general practice throughout the United States, however, is to remove the condensate from contact with the gas as soon as possible.

#### QUANTITY OF GAS TREATED, AND PRODUCTION.

The volume of gas treated is computed from the compressor displacement, and the record of engine revolutions with 5 per cent deducted for slippage. On this basis the gas passing through the plant varies between 1½ and 2 million cubic feet per day, and shows an average production of 3.09 gallons of condensate per 1,000 cubic feet of gas treated.

#### COMPRESSOR.

All gas compressed passes through a 2-stage Corliss-valve compressor, direct connected to a combination cross-compound, condensing Corliss engine; steam cylinders are 16 and 32 inches in diameter with 30-inch stroke. The compressor speed varies greatly, being dependent upon the amount of gas coming from the stills, which in turn depends upon the stage of distillation of oil at which the various stills are working.

#### SPECIAL FEATURES OF PLANT.

The noteworthy features of this compression plant are the scrubbers for removing sulphur and acid, the Root blower as a booster unit, the passing of gas through the condensate to bring about greater production of gasoline condensate by absorption, and the large amount of naphtha used in the blended product.

**MACHINES USED IN COMPRESSION PLANTS.**

Table 7 shows the total rated horsepower used in gas compression in each of the plants listed, and the number of cubic feet of gas compressed per day by one rated horsepower.

TABLE 7.—*Rated horsepower and capacity of various plants.*

Plant No.	Total rated horsepower.	Cubic feet of gas compressed daily per horsepower.	Plant No.	Total rated horsepower.	Cubic feet of gas compressed daily per horsepower.
3	110	4,100	34	300	2,900
4	200	4,000	35	100	3,500
7	3,800	4,100	36	480	2,400
9	330	3,300	37	170	2,300
11	490	3,100	38	300	2,500
12	240	2,917	50	230	3,700
14	330	3,000	51	110	2,170
16	100	2,500	52	100	2,500
17	300	2,500	54	900	2,500
19	575	3,090	55	300	4,170
20	495	3,030	56	210	1,800
21	300	3,300	57	250	2,600
22	180	3,300	76	200	4,750
23	210	3,500	77	50	8,000
32	605	4,300	78	50	900
33	360	3,300	79	105	2,380

The quantity of gas compressed or treated per horsepower in the plants visited varies between wide limits. The chief causes for this variation are that the intake pressures vary widely and also the final pressures vary between 75 and 300 pounds. Many other factors in plant operation also affect the results, among which are the actual efficiency of the engine and compressor used, the temperature of the gas at different stages, the sizes and length of pipes through which the gas is forced, and the power used in driving pumps and line shafts, which in many plants is taken from the engine that drives the compressor. In plants where expansion engines are used to compress gas no attempt has been made to estimate or add the power delivered by such units.

The table shows that the average plant visited by the writer has 340 horsepower and treats approximately 3,250 cubic feet of gas per day for each rated horsepower installed. The conditions under which many of these plants are operating may be found in Tables 3, 4, and 5. Among operators who design plants and use the rated horsepower, rated compressor capacity, and atmospheric pressure at the intake, with a discharge pressure of 250 pounds, 4,000 cubic feet of gas daily per horsepower is used for preliminary estimates of the requirements of a plant to treat a given volume of gas. The final estimates necessarily must include all the items mentioned above, and also take into consideration all of the special conditions under which the plant in question is to operate.

TWO-STAGE DIRECT-CONNECTED COMPRESSOR AND GAS ENGINE.

FIVE 485 BRAKE-HORSEPOWER GAS ENGINES, FRONT-CONNECTED TO 15½-INCH COMPRESSOR CYLINDERS, AT A WEST VIRGINIA PLANT THAT COMPRESSES NATURAL GAS TO A PRESSURE OF 275 POUNDS GAGE DISCHARGE. IS FIELD END OF A 20-INCH PIPE LINE.

## ENGINES AND POWER.

Machines of practically all well-known manufacturers making gas engines or compressors have found their way into compression plants. One company which has done much pioneer work in both the laboratory and the field, tending to develop the natural-gas gasoline industry, has placed its engines, compressors, or both, in many plants in every field visited by the writer.

Plates XIII and XIV show engine installations at two compression plants.

Table 8 gives data on the motive power, types, and sizes of engines and compressors, method of connection, and the number of compressor units used in the plants visited.

In plant 24, electric motors have been installed to drive the compressors. Originally gas engines were used, but the gas being treated became so rich in gasoline content that not enough gas was discharged after treatment to operate the engines. The motors are set on the blocks that were used for engine beds and are in the same room with the compressors. Because of the possibility that gas may escape about the compressors and be ignited by sparks from the motors, this arrangement would appear to be dangerous practice, but thus far, owing probably to especial precautions in ventilation, no fires or explosions have occurred.

Plants 19, 20, and 21, all built in 1916, use vertical 4-cylinder, 4-cycle gas engines belted to the compressor units. While this type of machine has many moving parts which may get out of order, and a long crank shaft with its bearing to watch and tighten, it is giving complete satisfaction and is claimed to economize fuel and give an overload capacity of 25 per cent.

The 450-horsepower, direct-connected, 4-cycle, double-acting machines, although recognized as standard installations in gas-pumping plants throughout the country, have a number of disadvantages as units for the treatment of gas for gasoline extraction. A machine of this size should be installed only in plants that draw gas from areas large enough to insure a supply for a long term of years, and are of such capacity that one of these large units represents only a small fraction (10 to 20 per cent) of the total plant capacity, otherwise shutting down one unit unbalances the entire plant and materially reduces the output.

c Expansion engine operated by expanding high-pressure, treated gas through it.

In the casing-head gasoline industry the gas supply from a given area is expected to decline and the pressure necessary to precipitate the condensable product usually becomes lower as the gas becomes richer. If all the power capacity thus relieved from duty is not used to increase the vacuums held on the lines, it is obvious that to remove one unit to another locality would be desirable. If one unit represented half the total plant capacity, it would be necessary to wait until the available supply of gas had been reduced 50 per cent before that unit could be transferred, but if that unit represented only 20 per cent of the plant capacity it could be removed when the gas had fallen off that amount; also it would be a much simpler matter to find a location or sale for a machine of one-half million feet capacity than for a machine requiring from three to four million feet per day. Another argument for machines of smaller capacity is the size and weight of parts which under the usual transportation conditions in oil fields is a serious problem in plant construction.

Both direct-connected (Pl. XV) and belted units are being installed in compression plants using the usual smaller units. However, many operators of wide experience prefer the belted drive, claiming that it simplifies repairs and renewals and gives a wider choice both of engine and compressor. The belted type requires larger buildings, because of the necessary distance between pulley centers, which the writer found to vary between 22 feet for vertical engines to 34 feet for horizontal types. In some plants two buildings are used, one containing the engines and the other the compressors, with belt galleries connecting the two. This is done as a precaution against fire and explosions.

#### **TYPES OF MACHINES USED AS EXPANSION UNITS.**

All expansion engines used in compression plants are machines originally designed to use steam that have been slightly modified to overcome the effects of the low temperatures from the use of compressed gas in the steam or power cylinders. Among the machines found in use are direct driven reciprocating pumps, drilling engines, and simple and cross compound compressors. Of these the reciprocating pump is the least to be recommended. The valves tend to freeze and stick, owing to the general design and slow action, and its efficiency as a power unit and its capacity are low.

Of the machines used as expansion engines the converted steam engine of the single or double stage (simple or compound) type is more often found than any other make. On these engines, remodeled for the expansion of high-pressure gas, the valve mechanism has been designed especially and made stronger for this particular service. The exceedingly low temperatures developed in the cylinders tend to freeze the valves, causing excessive strains on the valve stems and rods, and also make lubrication difficult.

DIRECT-CONNECTED COMPRESSOR AND GAS ENGINES.

Glycerin has universally been found to be the best lubricant for expansion cylinders and was in general use until the recent rise in price, and the difficulty of obtaining a reliable supply forced plant operators to try other oils, some of which have been found usable but not as satisfactory as glycerin. As the supply of that lubricant increases it will indoubtably again be generally used.

Other types of steam compressors and, in several plants, drilling engines belted to plunger or centrifugal pumps, are in use as expansion units, and, according to the operators using them, are giving satisfaction in regard to both capacity and temperatures. The loads of the drilling engines were varied to meet the conditions of pressure and volume of gas by throttling the flow of water from the pump, thus giving the required resistance for the development of power at normal engine speeds. The valve mechanism of the drilling engines was rebuilt and strengthened to meet these conditions.

At one plant where a drilling engine gave much trouble from freezing the piston rings were removed and the piston dressed to a square edge. The piston in this condition shaved the ice from the cylinder walls, thus preventing sticking or freezing. No lubricant was used in the cylinder, the film of ice or frost on its walls acting as a lubricant, and leakage past the piston after the film had formed was very small.

At plant 3 an engine of this type that has a 9 by 12 inch cylinder, making 90 revolutions per minute with one-fourth cut-off, takes gas at 130 pounds, gas at 250 pounds being throttled to that pressure, and exhausts it at 10 pounds. The engine is belted to a three-plunger pump throttled to a back pressure of 160 pounds in order to increase the load on the engine. The water pumped is used in the cooling towers and in the engine and the compressor jackets.

At plant 16 the expansion engine, accumulator tanks, and storage tanks are all housed in a double-wall insulated building. The advantage claimed is that the condensate is held at a low temperature in the storage and other tanks, thus preventing loss by evaporation through heating before blending. The condensate precipitated in the coils is kept from sudden and extreme rises in temperature, as would be the case if the storage tanks were not cooled or shaded. The temperature in the building and of the condensate in storage is thus held between 34° and 50° F.

Expanding the compressed, treated gas in engines to develop power for driving compressors or pumps is not an economy, because of the small amount of actual power delivered, the care necessary, and the cost of upkeep and lubrication, such engines being used only because the cooling effect the expanded gas has in the treatment of high-pressure gas in double-pipe coils or heat interchangers.

In simple expansion engines such as pumps, drilling engines, or single-expansion compressors the compressed gas before entering the

power cylinder is often reduced by a throttle valve from the maximum pressure used in the plant to pressures varying between 120 and 160 pounds, depending upon the design and size of the machine and the pressures for which it was built and under which it gives the best results.

Cross-compound machines usually take the gas at the maximum plant pressure and reduce the pressure in the first expansion to 30 to 60 pounds (see Table 5) and in the second stage to between 5 and 15 pounds. Generally the gas goes from the first-stage expansion cylinder to a drip or small accumulator tank, then directly to the low-stage cylinder. In plant 6 (see Table 4, p. 41), the gas from the first-stage expansion is led through a set of double-pipe coils and heated before being put through the second stage of expansion. By this system both the power developed in the expansion engine and the cooling efficiency of the expanded gas are increased, also the danger of freezing in the expansion cylinders is less.

#### COMPRESSORS.

Direct-connected compressor units are usually of the single-cylinder engine, single-stage type, although some plants in the eastern and Mid-Continent fields are using direct-connected, twin 2-stage machines. Of the direct-connected compressors the single-stage unit, found more often than any other make, as shown in Tables 8 and 9, has the engine and compressor cylinders opposed, or on the opposite sides of the fly wheels.

The sizes and types of compressors used in the various plants visited by the writer are shown in Table 8 (p. 74), which conveys an idea of the great variety of compressors and drives used in such plants.

#### AUXILIARY MACHINES.

In all natural-gas gasoline plants small engines are needed to circulate water in jackets, towers, and ponds, to produce electricity for light and pump air to start gas engines. The number, situation, and type and size of these units are generally matters of preference with each plant operator and no standard has been followed.

#### WATER-CIRCULATING PUMPS.

Many of the newest plants have centrifugal pumps belted to a pulley on the engine, which circulate the water used in both engine and compressor cylinder jackets; other plants use a line shaft with pulleys belted to the engines and to the centrifugal pumps. In many fields the water is heavily charged with mineral salts, and the water used in the cylinder jackets is often distilled or condensed and kept separate from that used in cooling the gas coils. This is often done by cooling the condensed water in a separate tower or by passing it through coils

in the main gas-cooling tower that are cooled with spray in the same way that the gas coils are cooled. In the latter method the condensed water is pumped from the coils in the tower through the jackets and back to the coils in a closed circuit. Where a separate tower is used the condensed warm water is sprayed in the tower, collected in the basin beneath the tower, and circulated by pumps through the jackets, and returned to the top of the tower to repeat the cooling and aeration. In this method the loss of condensed water in the tower is so great that it is not to be recommended unless the condensed water is easily made or obtainable from a boiler plant. The cooling effect gained is better, and the installation less expensive, if the cost of condensed water is not an object.

For circulating the water used to cool the gas, usually centrifugal or plunger pumps driven by small (5 to 10 horsepower) gas engines, or belted to a line shaft, are installed.

#### AIR PUMPS.

Air pumps for compressing air in receivers to start the main gas engines are generally single-cylinder pumps or compressors belted to gas engines, previously mentioned, or, in some plants, to a line shaft driven by a small gas engine. The receivers are built to stand pressures up to 250 pounds. When the desired pressure is built up in the receiver, the air pump is shut down until the pressure is relieved by use in starting the main gas engines, or by leakage, when the pump is again operated until the required pressure is obtained.

#### LIGHTING EQUIPMENT.

The necessity of using strong, reliable inclosed lights around compression machinery and the danger of open flames in plants treating natural gas at high pressures has forced operators to install small electric generators as part of the equipment of gasoline plants.

The electric plant is always housed in a building separate from the compressors, and usually in the building with the air and water pumps. The unit consists of a gas engine belted to a dynamo of a size and capacity suitable to the lighting needs of the plant, and is operated only at night. In large gas-pumping stations storage batteries are used both for light and for engine ignition, in place of direct connections.

#### GASOLINE PUMPS.

Plants situated some distance from the shipping point or blending station often require pumps to force the gasoline through the pipe lines to such stations.

The product is often blown from one tank to another by turning high-pressure gas into the tank containing the product, but where the

distance is great this method is not always satisfactory, and pumps of either rotary or reciprocating type are installed, usually being operated by belt connections to small gas engines. It is claimed for the rotary pumps that condensate losses are smaller than from the use of other types, because the agitation is less and the flow more steady and quiet through the pump and into the lines.

### BLENDING AND SHIPPING THE CONDENSATE.

Although blending of compression-plant condensates is not done primarily for the purpose of making a product that will meet the specifications required by transportation laws governing the shipment of gasoline by rail or water, blending and shipping have become such important functions, one of the other, that a separate discussion of the blending process and the transportation of the blended stock is not desirable.

#### REASONS FOR BLENDING.

When the condensate produced by compression is allowed to weather unblended until its vapor tension is reduced to less than 10 pounds at 100° F. and its temperature rises to atmospheric, losses ranging up to 75 per cent of the total product often result, whereas if the condensate is mixed (blended) with heavier straight still-run refinery distillates the losses from weathering are reduced, usually to one-half that amount, and often more. This fact has led condensate producers to take advantage of blending to increase the volume of the product actually marketed, thus increasing their profits and also the supply of marketable motor fuels so desirable under present conditions. The development in gasoline motors up to the present time has not reached a stage that would make the heavier still distillates, such as are used for blending, a convenient or economical fuel if used as made, because of the difficulty in starting the motor with such fuel and its tendency to deposit carbon in the cylinders and on the pistons from incomplete combustion, causing "engine trouble."

Condensate produced by compression is also an undesirable fuel for gasoline engines. It is exceedingly volatile, which causes losses in handling, is dangerous because fumes are easily formed, and gives less power as compared with equal volumes of heavier distillates, a larger number of gallons being required to develop the same power. It gives a quick, sharp explosion in a motor cylinder, but seems to lack "push" after the explosion has taken place. In the above qualities it is in no way different from still-run products of similar gravity and similar end points, both products needing additions of less volatile, heavier, and more powerful fractions in order to form the most convenient and economical motor fuel.

The lighter fractions of petroleum distillates, as compared with the heavier products, have a lower calorific value per gallon but a

higher calorific value per pound. As all products of petroleum are sold in the United States by volume or liquid measure, the standards for comparison must be made on the heat units per volume and not per weight.

As previously stated, another important factor in blending is transportation. The Interstate Commerce Commission rules controlling shipments of petroleum products and liquefied natural gas allow transportation of petroleum distillates having vapor tensions of less than 10 pounds per square inch in standard tank cars, and products with vapor tensions of 15 pounds per square inch in specially built insulated tanks. As many plants produce condensate that has a vapor tension of 30 or more pounds as it comes from the accumulator tanks, blending and weathering are both resorted to by most manufacturers in order to bring the product within shipping rules, to increase the quantity, and to improve the quality of the product.

#### **MARKETING UNBLENDED CONDENSATE.**

A small quantity of natural-gas gasoline finds its way to consumers unblended. It is sold as "gas-machine gasoline," a product with a gravity of 80° to 86° B., used to make gas for certain domestic, commercial, and chemical purposes, and as "export gasoline," a product with a gravity of 74° to 80° B. and of 4 to 6 pounds vapor tension, which is usually sold in containers to foreign trade.

The great bulk of condensate, however, is blended in one way or another before it reaches the consumer, but not always completely blended at the plant where it is made, or by the producer.

In many eastern fields the condensate is held in storage under pressure until a given quantity is ready for shipment, when it is forced by gas pressure or pumps through small (2-inch) pipe lines to the tanks of firms making a specialty of blending and marketing motor fuels, and having blending stations centrally situated among the compression plants from which they receive condensate. Products having a gravity as high as 84° B. are shipped in this way to blending companies.

#### **SHIPPING BY AUTO TRUCK.**

Another method of shipment, used mostly in California and northern Pennsylvania, is by tanks mounted on auto truck. Two plants shipping condensate of 80° to 83° B. gravity in this way are situated 30 miles from the blending stations of the buying companies. These are unusual examples, but a number of plants ship their product 6 to 10 miles in tanks of this character. Generally the tank is kept under a pressure of 10 to 20 pounds in order to reduce losses of the light condensates from agitation and heating during transportation.

## TRANSPORTING CONDENSATE IN CRUDE OIL.

Certain large producing and refining companies in California which buy or produce casing-head gasoline gage the product in the storage tanks at the compression plants for settlement, and have the condensate pumped directly into their crude oil storage or pipe lines leading to their refineries. They not only recover the gasoline when the crude oil is refined, but take advantage of the fact that the condensate "cuts" the crude, making it flow through the lines more easily. The extremely light fractions that are thus injected into the crude oil, and will not condense in the usual refinery condenser boxes, can be and are in many refineries compressed and cooled as in compression plants. This product is immediately blended at the refinery and thus held and sold.

As previously mentioned, a company in the Mid-Continent field produces only such condensates as can be shipped in tank cars. This is done by regulating the pressures and the temperatures used in the compression plant, so that only such condensate as can be shipped unblended will be precipitated.

A plant in California and some plants in other fields reduce the unblended condensate to conform with the shipping rules by weathering, because of the cost of shipping in blending naphtha. The condensate is exposed in storage tanks to atmospheric temperature and pressure until the vapor tension is reduced to the desired point, and then shipped in insulated cars. At times warming with steam is resorted to if the atmospheric conditions do not bring about the proper results. The use of steam is not to be recommended, however, except when absolutely necessary, because of the loss of some of the heavier fractions with the lighter ones.

## METHODS OF BLENDING.

Blending condensate with the various distillates used for that purpose, as practiced at present, is done at times in stages, and at many different points in the precipitation, storage, or transportation of the product.

The product of plants that ship their condensate without being blended usually goes to refineries or blending stations belonging to purchasers of this type of product, who blend the condensate before sending it to the retail markets. One blending company in West Virginia buys condensate, pumps it to the plant in pipe lines, stores it in closed tanks until needed, then blends it with naphtha in the following manner:

A tank car of naphtha is one-half unloaded, usually into an empty tank car, and then condensate is slowly pumped in through a valve in the bottom until the tank is filled. The condensate rises through

the naphtha and slightly agitates it, and in this way becomes absorbed and blended with the naphtha. At times the operation is reversed, a tank car being half filled with condensate and the naphtha pumped in from above. No further treatment is used, the car being shipped as soon as filled. The agitation during shipment tends to complete blending if such is necessary.

Blending practice at some refineries and casing-head gasoline plants is practically the same as described above except that stationary tanks are used in place of tanks on cars. At other blending plants a pump is used in blending, its suction being connected with two tanks, one of blending stock and the other of condensate. The flow of each is regulated in the pipe line by valves, the discharge of the pump going to a storage tank. From time to time the mixture in the storage tank is tested for gravity, if the blend is too light or too heavy the flow of either naphtha or condensate is adjusted to give the desired mixture.

At some plants methods of blending are more complicated. The procedure used by one company receiving its condensate by auto truck is as follows: A given quantity of California distillate with a gravity of  $53^{\circ}$  to  $55^{\circ}$  B. is placed in a cone-bottom blending tank, where it is washed with acid solution, caustic solution, and water; after this treatment condensate with a gravity of  $72^{\circ}$  to  $82^{\circ}$  B. is forced into the tank from the bottom. Air is then blown through the mixture to agitate it and remove the lightest fractions of condensate and dissolved gases. The mixture is tested for specific gravity, after which enough still-run California gasoline with a gravity of  $58^{\circ}$  B. is added to bring the whole to a gravity of  $60^{\circ}$  B. The blended gasoline produced by the above method and ingredients is sweet, water white, and has the following characteristics: 5.9 per cent distills over up to  $140^{\circ}$  F., the distillate having a gravity of  $79.9^{\circ}$  B.; 70 per cent distills over up to  $246^{\circ}$  F.; and 30 per cent distills over between  $246^{\circ}$  and  $344^{\circ}$  F.

Distilling this blended product in 5 per cent cuts shows it to be an exceptionally good motor fuel with none of the usual fractions missing.

While holding condensate in storage some blending companies and refineries, as well as compression-plant operators, keep the tanks containing such stock under pressure and often the tanks are insulated or housed and shaded in order to reduce evaporation by the sun and the atmosphere, one company having gone to the expense of building a louver tower over the tanks and keeping small sprays of water constantly covering them. The tanks, which are held under pressures of 10 to 20 pounds, are set in a concrete or wooden basin. The water collects in this basin, thence it is again circulated over the tanks by pumps. No outside cooling of the water is resorted to, the

evaporation from falling through the tower and over the tanks being sufficient to keep the water at a temperature considerably below that of the atmosphere, also any volatilization of the condensate itself tends to cool the liquid.

Where blending is done by refining or blending companies, as has been described, the operation is complete and the blended product is ready for market. The blended gasoline made in the Eastern fields has a gravity of between 65° and 70° B., and that made in California between 58° and 63° B. The difference in gravity is due to differences in the character of the crude oils from which the condensate and the blending stocks were made; this variation is discussed in later paragraphs. The blending is usually done so as to bring the product to a given gravity by the mixture of the two ingredients, whereas the final end point is determined by, and is the same, as the end point of the naphtha used. Although the proportions vary under these conditions, the proportions to be mixed to make a product of a given gravity can be approximately calculated from the gravity and the end points of the two liquids.

The methods of disposal of condensate mentioned are found mostly in California and some eastern districts; with few exceptions the practice in the Mid-Continent field is to blend either at the compression plant or at the loading station operated in conjunction with the plant.

#### BLENDING BY PLANT OPERATORS.

When the blending is done by the operator of the compression plant, one of the following methods is generally adopted: (1) Blending all of the condensate at the blending station or loading racks; (2) blending to a given stage at the plant, and transferring the partly blended product to the loading racks and either finishing the blending there or shipping it to some point at which naphtha is cheaper or more readily obtained; and (3) completing the entire operation at the plant.

#### BLENDING AT THE LOADING RACKS.

Many of the companies controlling two or more compression plants, situated in the same field and tributary to the same shipping point on a railroad, have adopted the method of blending the products from all their plants at a central station. A centrally situated loading station with racks and tanks (see Plate XII, A, p. 52), is necessary in any event for storing and loading the plant products and unloading and storing the blending stocks, so that the stations can be also fitted for blending practically without additional cost of labor and small increases in tankage.

In stations used in this way, the usual equipment consists of tanks of any desired capacity for the storage of naphtha, other tanks for

the storage of condensate, and tanks for the blended stock and from which the marketable product is transferred to tank cars for shipment.

The plant condensate is pumped or forced by its own pressure through small pipe lines into the condensate storage tanks, and the naphtha from tank cars is pumped into the naphtha tanks. From the naphtha storage tank a given quantity of naphtha is first pumped into the blending tank, then condensate is forced into the blending tank at the bottom, being allowed to rise through and be thoroughly absorbed by the heavier naphtha. When the predetermined quantity of each stock has been mixed in the blending tank, samples are tested for gravity, and if any change in gravity is desired more of the heavy or light stock is added, as the tests indicate to be necessary. The blended gasoline is next tested for vapor tension, and, if it is found to be too high for shipment in the cars used (standard or insulated tanks), the tank is allowed to stand open to the atmosphere for several hours, or even days, if necessary. In some plants it has been found necessary to heat the blended products to 80° to 90° F. with steam, in order to reduce the vapor tension to the required point in a limited time, so that the blending could continue without the installation of an excessive amount of tankage. Heating with steam should not be resorted to if avoidable, as a quick rise in temperature drives the lighter condensates off rapidly, carrying with them portions of the heavier and less volatile fractions. When the specific gravity and the vapor tension have been brought to a point within the regulations governing shipments of gasoline, the contents of the blending tank are either drawn off into cars for immediate shipment or pumped into a storage tank.

The blending method used at the majority of such stations usually consists merely of mixing calculated quantities of the different stocks to be disposed of and reducing the vapor tension of the mixture by open contact with the air or by slight warming with steam coils, placed in the blending tank.

The advantages of blending at loading and storage stations are that the productions of a number of plants can be handled, close connection with railroad service, and the low cost of handling both the naphtha and the blended stock. At times the tank cars are used as blending tanks, as described in a previous paragraph.

#### PARTIAL BLENDING AT PLANT.

Some operators, because of the plant being in a place where it is difficult or costs too much to bring in large quantities of naphtha, or, more often, because the company controls a refinery and desires to refine the gasoline by further treatment, such as distilling, have adopted the practice of blending only so far as is necessary for shipment at the compression plant or blending station, the final blending

and treatment being given at the refineries or points where the desired quantities and qualities of distillates may more readily be obtained. Some operators blend partly at the plants and finish the operation at the blending station or loading racks as described above, thus saving the costs of handling, of pipe line, and of the pumping capacity necessary to transfer all of the heavy blending stock to the plant and back to the loading station.

When the blending is completed at the blending station, it is done in the way described, except that smaller proportions of heavy naphtha are added, because some heavy naphtha has been previously added to the condensate at the plant.

#### PLANT BLENDING METHODS.

Plants at which blending is entirely or partly completed have developed methods and practices quite different from the usual way of mixing the two constituents in a blending tank. Many plants still blend the condensate and the naphtha in storage or blending tanks, using the methods previously described above, but a tendency has developed for blending at much earlier stages of the process.

#### BLENDING IN "MAKE TANKS."

The first step in this development was when certain operators pumped blending naphtha into the tanks known as "make tanks" (see Pl. IV, *C*, p. 26, and XII, *C*, p. 52), which receive the condensate from the accumulator tanks, and in which the total make of one day or shift was measured before being transferred to storage. The method as now used is to pump naphtha into the tank at such a rate that the percentage in the mixture would be somewhat below that desired in the final blend, or to place a given quantity of naphtha in the make tank and discharge condensate from the accumulators into the naphtha. In transferring condensate from the accumulator tank to the make tank, the sudden release of pressure causes violent weathering or boiling, owing to the high vapor tension. By adding heavier blending stocks at this point the vapor tension is lowered, with consequent lessening of losses from the light condensate and dissolved gas weathering rapidly and carrying off with them part of the heavier fractions.

The product of this blend is gaged in the make tank, the quantity of naphtha deducted, and the actual plant production calculated. At the end of each day or shift the mixture is transferred to storage tanks and the blend completed or shipped to another point for blending as described above.

#### BLENDING IN ACCUMULATOR TANKS.

Blending in accumulator tanks, as found in practice by the writer, consists of pumping naphtha slowly and continually into the tanks, connected with the high-pressure coils, at a pressure a few pounds in

excess of that at which the gas is being treated. The naphtha is injected into the tank through small ( $\frac{1}{4}$ -inch) pipes at a point near the top and through fittings which cause a spray, the theory being that the spray will collect fine particles of condensate in falling through the gas and reduce the gravity and the vapor tension of the product before it is released from the high pressure at which it is precipitated and thus reduce losses of condensate.

Operators using this method claim it produces a marked increase in plant production, one in particular claiming a net increase of 10 per cent. The mixture is drained from the accumulator tank as in other practice, either automatically or by hand, as the custom of the plant may be, the quantities being figured as previously described to determine the plant production.

#### HOT BLENDING.

When naphtha is injected into the high-pressure gas while it is in the coils, or before it has reached the coils, and is still hot from compression, the method is called "hot blending."

This method has been adopted at some plants where the gas treated contains large proportions of the exceedingly light fractions and the condensate had shown extreme losses in storage and during weathering and blending by other methods. A Pennsylvania operator producing condensate with a gravity of 92° to 95° B. claims a net gain of 15 per cent in marketed condensate from the use of this method, and one in Oklahoma, approximately 30 per cent.

Hot blending has been tried out at two California plants, in different fields, to the writer's knowledge and no advantage gained. The plants produce condensate with a gravity of 82° to 86° B., using pressures between 200 and 250 pounds.

One eastern plant, which compressed the gas to 300 pounds pressure, injects naphtha through a needle valve placed in the high-pressure water-cooled coil header at the intake (hot) end of the coil. The naphtha is pumped through the valve at a pressure of 400 pounds per square inch, which causes it to spray or atomize in the header and intimately mix with the hot gas as the gas divides into the coil pipes leading out of the header. The first few (10 to 15) feet of this coil is kept dry to permit the hot gas to vaporize as much of the naphtha as possible before the gas and the naphtha are cooled by the water sprayed over the rest of the coil.

What happens to the injected naphtha is not definitely known, but it appears that the naphtha is divided into three parts. One part is volatilized by the heat of the high-pressure gas (190° F. on the day of the writer's visit), carried with the gas into the water-cooled coils, and again condensed, thence it is carried to the accumulator tank with other condensate. A second part of the atomized naphtha is probably carried mechanically into the upper pipes of

the coil by the flow of gas, where it settles out, owing to the slower rate of flow, and carries with it other condensable vapors. The third part, which is neither vaporized nor carried mechanically into the upper members of the coil, goes to the bottom of the header and flows with the gas through the bottom pipe and blends with the condensate and naphtha in the discharge header, while still under maximum pressure. The mixture then flows to the accumulator tank and thence is trapped into storage tanks.

The quantity of naphtha injected into the header is calculated to be somewhat less than is needed to bring the mixture to the gravity desired, the balance being added, in this plant, to the partly blended stock in the make tank, which is also held under pressure. Another feature of the practice at this plant is that the pressure on the blended stock is reduced slowly to avoid violent boiling or weathering. This is accomplished by holding a pressure of 50 or 60 pounds on the make tank while the output of the plant is being transferred to it during a day or shift. At the end of that period another tank is put into service and the pressure on the tank containing the day's "make" is slowly relieved, while the stock gradually acquires approximately the temperature of the atmosphere. At this point the blend is transferred to storage tanks or placed in tank cars for shipment. For each 100 gallons of condensate produced 77 gallons of naphtha is pumped into the coils, which lowers the gravity of the condensate from 90° to 96° B. to between 70° and 76° B.; later, in the "make" tank, enough eastern naphtha, with a gravity of 58° to 60° B., or California distillate, with a gravity of 48° B., is added to form a blend of the desired quality.

At another plant a practice similar to the one just described was adopted, except that the naphtha was injected into the hot-gas line at a point just beyond the oil separator and 40 or 50 feet ahead of the coils, the naphtha thus traveling with the gas through the coils and on to the accumulator tanks. This plant, although making 9 gallons of condensate per thousand feet of gas treated, as measured in the accumulator tanks, had by the old method of blending been able to market only 2.5 gallons. By the adoption of hot blending it was able to market 3.7 gallons from each thousand feet of gas treated. The loss, however, is still extremely high, and it is probable that an entire readjustment of pressures and temperatures throughout the plant would show better returns and smaller losses.

#### POSSIBLE IMPROVEMENTS IN BLENDING METHODS.

No set of rules can be given or standard methods of blending described that would even approximately cover all conditions, but there are methods and practices that if adopted by individual plants would have marked advantages and show a decided saving of condensate.

The problems of each plant must necessarily be taken up separately and a study made of the properties and characteristics of the condensate formed, such as the gravity, the vapor tension, and the proportions of the different "cuts" and the hydrocarbons they contain. That these vary widely is shown by the different pressures and temperatures necessary to precipitate the condensates, also by the vapor tensions or wildness of different plant products. The point at which blending is done should be given attention, to find whether the best results are obtained by blending in storage tanks, in make tanks, in accumulator tanks, or in coils, also the effects of release of pressure and rise in temperature should be studied to find whether sudden lowering of pressure and rise in temperature does not cause undue losses. Blended products are at many plants placed in storage tanks which are not protected from the sun and a quick rise in temperature is to be expected. The color an exposed tank is painted, has a direct bearing on the amount of heat absorbed from the sun's rays and taken up by the contents. Releasing the pressure on the condensate slowly, or holding it under a low pressure and storing it in insulated tanks has, at a number of plants, been found to decrease losses.

Refining companies have found that storing the lighter distillates in tanks with the water-sealed top, painted glossy white, show reduced losses well worth the expense of construction and operation of this system of storage.

#### **LOSSES OF CONDENSATE IN WEATHERING AND SHIPPING.**

Plant operators, in reporting losses of condensate, often use as a basis the total amount of condensate collected and measured in the accumulator tanks before blending, and while still under pressure, which is obviously the wrong place to make such an estimate, because such measurement is taken during treatment and not at the final stage of production. The condensate in the accumulator tank, because of the temperature and pressure, contains some dissolved gas and fractions of the hydrocarbon group which it is impossible to hold under normal atmospheric conditions, and which should not be counted as loss when computing the plant production.

The writer, in order to form an accurate idea of the losses at different plants, and as far as possible to use the same basis in estimating these losses, has obtained from the plants listed the quantity of condensate actually stored in tanks, either blended or unblended as the practice indicated. With this quantity as a basis estimates of the losses in further operations, such as weathering, pumping to loading stations, loading in cars and shipping, are computed.

In Table 2 (p. 29), the column headed "Daily production, gallons," represents the number of gallons that were actually marketed by the different plants listed, as nearly as these figures could be arrived at, and is net production after all losses are deducted.

## CALIFORNIA PRACTICE.

California plants, in general, trap or blow the product of the accumulator tanks directly into storage tanks without blending and measure the make in the storage tanks. As these tanks are seldom held under pressures greater than 5 to 15 pounds, weathering goes on continually and causes an unknown loss, only the weathered product being measured.

At plants where the raw condensate is pumped from the storage tanks into the crude oil storage tanks of purchasing companies, under this method of calculating losses the results show no loss except that due to weathering while the condensate is being held in plant storage, the product being sold on the gage readings taken in the storage tank at the compression plant.

Companies shipping raw condensate in automobile trucks distances of 2 to 40 miles report losses in loading, transportation, and unloading of 2 to 7 per cent. Those delivering their product through pipe lines 1 to 40 miles long report losses of 1 to 6 per cent, depending on the length of the lines, the amount of leakage from them, and the pressure necessary to force the liquid through.

## EASTERN PRACTICE.

Many plants in the eastern fields ship raw condensate by pipe line and trucks, as in California practice, with losses the same or slightly greater in amount than those quoted, owing to the raw products having higher gravities and vapor tensions. One large oil company has recently laid pipe lines to a number of the fields in northern and western Pennsylvania for the purpose of collecting the raw condensate produced in those fields and which was formerly hauled to market in trucks. Well-constructed pipe lines will undoubtedly minimize losses from handling condensate produced in this district.

## OKLAHOMA PRACTICE.

Casing-head gasoline producers in Oklahoma estimate the total loss as varying between 10 and 40 per cent. The losses during weathering of the blended product run from 10 to 20 per cent, depending on the gravity of the raw product and the vapor tension of the blend. Often heating with steam is necessary, before loading the condensate into tank cars, to bring the vapor tension within the limits required by the railroad shipping rules, especially in cold weather, when weathering will not bring the blended stock to the desired condition.

The loss in this field due to transferring the product from the plant storage tanks to loading or blending stations varies from 2 to 7 per cent, and in loading from a rack to cars, between 1 and 5 per cent.

The loss during shipment in standard tank cars is variously given as being between 2 and 10 per cent, with an average of approximately 6 per cent, the loss depending much on the distance and length of time used in haulage, the atmospheric temperatures encountered, and the condition of the tank used for shipment.

The so-called thermos cars, an insulated tank car, have given very satisfactory returns on their cost to certain producers using them, who report a maximum outage (loss in transit) of  $2\frac{1}{2}$  per cent when used for long shipments in hot weather, and report instances of no outage on short hauls in moderate, rainy, or cold weather. The railroad rules governing shipments in insulated cars are more in favor of the shipper in regard to vapor pressures, allowing 15 pounds as the maximum in place of 10 pounds as in standard cars.

The losses in blending and shipping in the Mid-Continent field may be generalized as follows:

	Per cent.
Weathering.....	5 to 20
Transferring to loading station.....	2 to 7
Loading in car tanks.....	1 to 5
Shipping in standard cars.....	2 to 10
Total losses.....	10 to 42

Plants treating gas that contains large proportions of the lighter fractions and using pressures and temperatures that will precipitate these fractions produce the "wildest" condensate and in consequence suffer the greatest losses. As the converse of this practice a single-stage plant (No. 76 in the tables) in the Mid-Continent field, mentioned in several places throughout this paper, produces a condensate having a gravity of  $79^{\circ}$  B. and a vapor tension of about 5 pounds that is shipped in standard tank cars with a total loss of 2 to 3 per cent, including the losses from being transferred several miles through pipe lines to the loading racks and from loading into the cars.

#### NAPHTHA USED AS BLENDING STOCK.

To form an ideal motor fuel, the distillate or naphtha used in blending should be one that will give the mixture a uniform series of fractions between the temperatures at which distillation begins and finishes, with none of the fractions with boiling points so high as to cause incomplete combustion and carbon deposits in motor cylinders.

To blend and weather condensate to correspond with the above conditions is possible, but such practice, because of the great waste and expense, is followed only in blending special gasolines for engine or speed tests. Also, in making straight refinery distilled gasoline, because of the increased demand for motor fuel, more and more of the heavier distillates have been cut into the motor-fuel fractions, causing a lower gravity and a higher end point.

Rittman, Dean, and Jacobs <sup>a</sup> have shown clearly the differences in still-run and blended gasolines (see fig. 13) as they are put upon the market. They state that the blended casing-head products have larger percentages distilling below 50° C. but have longer distillation ranges, which tend to make the slope of the temperature-percentage curves for these gasolines flatter than those of straight refinery products. They also state that any gasoline having an unusually large distillation cut below 50° C. and with considerable percentages distilling within the temperature ranges of 150° to 175° C. and 175° to 200° C., and being deficient in constituents boiling at intermediate

FIGURE 13.—Curves showing volatility ranges of refinery and of casing-head gasoline. 1, refinery gasoline; 2, casing-head gasoline. The flatter slope of the curve for casing-head gasoline shows that the content of both low and high boiling constituents is greater in the blended gasoline. After Rittman.

points of the distillation, may be classed as one of these blended products.

The naphthas or distillates being used for blending are those fractions that distill from crude oil after the cuts marketed as "straight still-run" gasoline have distilled off. The naphthas made from eastern and Mid-Continent crudes range in gravity from 46° to 60° B., whereas those made from the asphaltic base California crude oils range between 42° and 52° B. The difference in the eastern and western distillates is due to the fact that the crude oils in the different fields differ in character, having paraffin, asphaltic, or mixed bases.

<sup>a</sup> Rittman, W. F., Dean, E. W., and Jacobs, W. A., Physical and chemical properties of gasolines sold throughout the United States during the calendar year 1915: Tech. Paper 163, Bureau of Mines, 1916, p. 27.

The eastern and the California naphthas used in blending have approximately the same end points, although the gravities differ  $7^{\circ}$  to  $10^{\circ}$  B.; also the blends formed have different gravities, although the end points, power developed per gallon, and the completeness of combustion of the mixtures are practically similar. The differences in the specific gravities of the various cuts of similar end points from the different crudes decreases as the cuts become lighter.

Mid-Continent crudes having mixed bases vary between California and Pennsylvania crude, and have gravity and end point ratios between the two extremes stated above.

Certain companies in buying blended gasoline specify that the product shall have a gravity of not less than  $67^{\circ}$  B. and an upper end point not more than  $400^{\circ}$  F., which will require that naphtha with a gravity of about  $55^{\circ}$  B., if from Mid-Continent crude, or  $48^{\circ}$  B., if from California, be used in making the mixture.

Numerous blending plants, however, use distillates with as low gravity and as high end point as the kerosene fractions, and, as far as is known, find no trouble in marketing such blends. In using naphthas for blending it has been found that the heavier naphthas give better results than the lighter ones in lowering the vapor tension of the mixture, for equal quantities put in, the heavy fractions having a tendency to "hold down" the light fractions.

#### PROPORTIONS IN BLENDS.

In general it may be stated that blended gasoline usually consists of a mixture of half casing-head gasoline and half naphtha or distillate, but the proportions vary, depending upon the gravity and vapor tension of both constituents, blending being carried to a point, in conjunction with weathering, that brings the product within the shipping rules and shows maximum profits to the producers.

#### STRATIFICATION OF BLENDED GASOLINE.

In many quarters belief has been expressed that in blended gasoline the light condensate fractions separate from the heavier distillate fractions, causing stratification. The writer could find no direct evidence that such stratification takes place, and interviewed many operators and blenders who had made various tests and were unable to find such a condition. It is true that owing to change of temperature, in a closed tank, the lighter fractions at times vaporize and condense on the sides of the container and drain down, floating in a thin layer on top of the liquid. This condition may have given rise to the belief regarding stratification, but, as shown, is not due to separation of the two or more blended constituents through differences in their gravities. All fractions of petroleum oils are gen-

orally considered as soluble, one in the other, and a blend of two or more fractions such as naphtha and condensate should not separate or stratify. All evidence obtainable indicates that no such stratification actually takes place in blended motor fuels through the difference in specific gravity of the members blended. A test made on a California blended product and reported to the writer showed no separation. The blend, which was a small quantity of condensate with a gravity of 105° B. and a large quantity of distillate with a gravity of 48° B., was placed in a 10-barrel tank and tested after standing one week without being disturbed. Samples drawn from the top and bottom had specific gravities differing only 0.07° B. This blend found a ready market as fuel for motor trucks.

The naphthas used and the blends marketed at the present time depend to no small extent on the market conditions of the heavier distillates. Naphthas that can be obtained in quantity easily and regularly, thus insuring a steady supply, are often chosen in preference to a more perfect blending stock, supplies of which can not be depended upon.

#### **COSTS OF COMPRESSION PLANTS.**

The widely varying conditions under which compression plants are being installed, both as to situation and the machinery and the steel markets, make estimates of the costs of plants so uncertain that the subject will be undertaken with the idea of showing the costs of plants recently installed, of which the writer has knowledge, rather than to attempt to estimate costs in general for present or future installations.

An operator in the Mid-Continent field who has built and is running three plants computes plant construction costs on a unit basis and gives the costs of one unit that will treat 400,000 to 500,000 cubic feet of gas daily, as follows: One single-stage unit, compressing the gas to a pressure of 75 or 90 pounds, \$8,000 to \$9,000; one two-stage unit compressing to 200 or 250 pounds, \$15,000 to \$18,000. Vacuum pumps at the compression plants are included in this estimate, but not gathering lines with their pumps, or the expansion engines that are used at the plants. On this basis, a 1,000,000-foot plant compressing gas to a pressure of 250 pounds would cost approximately \$36,000, or \$36 per 1,000 feet of capacity.

The expense of construction and equipment of a plant compressing 1,250,000 cubic feet of gas daily to 250 pounds, put into commission in June, 1916, was stated to be \$36,570, divided as follows:

*Cost of compression plant with a capacity of 1,250,000 cubic feet.*

Machines, engines, compressors, water pumps, and air pumps and tanks.....	\$18,240
Pipe and fittings, engine and compressor connections, cooling coils and double-pipe coils.....	1,534
Building compressor room with steel frame, cooling tower, accumulator tank and storage housing, auxiliary engines and pumps.....	6,756
Gathering lines.....	3,797
Tankage.....	1,105
Gas traps.....	700
Electric plant.....	395
Labor, carpenter work; pipe-fitting; concrete, etc.; setting engines.....	4,043
Total.....	36,570

No expansion set is included in this estimate, but when the capacity of the plant was doubled later in the same year a simple single-stage compressor was installed as an expansion engine and is used to expand all of the gas treated, or 2,500,000 cubic feet. The construction of the first half of the plant shows a cost of \$29 per 1,000 feet capacity. The entire cost of the plant after the original capacity was doubled and an expansion engine installed is approximately \$60,000, or \$24 per 1,000 feet capacity.

Another plant with a total capacity of 2,500,000 feet, built during the same period, using the same pressures and very similar to the plant described above, in units and "hook-up" (compressor and engine drive), but using a drilling engine as an expander, cost \$55,000, or \$22 per thousand feet capacity.

The cost per 1,000 feet of capacity of plants treating small quantities of gas, 100,000 to 250,000 cubic feet daily, is relatively higher; instances having come to the attention of the writer of costs of \$40 or \$50 per 1,000 feet capacity for plants of that size.

One small plant—a 250,000-foot plant compressing gas to 250 pounds—including an expansion engine, cost \$11,000, or more than \$44 per 1,000 feet of capacity.

Plants treating small quantities of gas under pressures obtained by single-stage compressors and having simple cooling systems, such as are found in many eastern fields, notably Sistersville, W. Va., cost much less than is indicated by the above estimates.

No estimate of costs of gathering systems, with vacuum stations and booster compressors, can be made, as the conditions vary from a few hundred feet of 6-inch lines to lines of 8 and 10 inches diameter extending 5 to 10 miles from the plant and having as many as 30 pumps and "booster" machines forcing the gas through the mains and maintaining low pressures on the wells.

## THE ADVANCEMENT OF THE INDUSTRY.

Since the first commercial gas compression plants were established, about 15 years ago, in the eastern oil fields, marked advancement has been made in the mechanical and commercial phases of the natural-gas gasoline industry.

Up to about five or six years ago, most of the plants consisted of the simplest forms of gas pumps, single-stage compressors, and cooling coils, were operated only on rich casing-head gas that would produce 4 to 6 gallons of condensate, and had a capacity of not more than 200,000 or 300,000 cubic feet daily.

At present plants are in operation treating 6,000,000 to 9,000,000 cubic feet daily of gas yielding as low as 1 gallon of condensate per 1,000 cubic feet, using pressures of 250 and 300 pounds per square inch in two stages of compression, with elaborate systems of cooling the gas with water before compression and after each stage of compression. The water used is cooled below normal temperatures by induced aeration and radiation.

In some plants the gas is further cooled by expanding the dry treated gas through the cylinders of an expansion engine and using the cold expanded gas to cool the high-pressure gas from the water-cooled coils. Temperatures as low as 0° F. are often obtained, causing the precipitation of nearly all the condensable fractions commercially valuable for making gasoline.

## FORMULAS AND TABLES GOVERNING THE FLOW OF GAS IN PIPE LINES.

Formulas governing the flow of gas in pipes have been worked out by Weymouth and discussed by him in a paper<sup>a</sup> published by the American Society of Mechanical Engineers. These formulas with that part of Weymouth's report that relates to the flow of gas in pipe lines are given in the following:

### TRANSMISSION OF NATURAL GAS.

By THOMAS R. WEYMOUTH.

In the design of pipe lines for the transmission of natural gas from the field to the points of consumption it is necessary to make use of a formula expressing the relations to each other of the quantity and initial and final pressures of the gas, and the diameter and length of line. Many such formulas have been proposed giving widely differing results. In nearly all of them the flow is stated as varying as the square root of the fifth power of the pipe diameter, and either the coefficient of friction is considered constant, or a different coefficient is given for each diameter of pipe. This serves well enough where the diameter is known and any one of the other quantities expressed by the formula is desired, but is somewhat awkward when it is desired to ascertain the diameter of line necessary to meet the other given conditions.

The author has derived a new formula which he believes expresses the relationship of the quantities involved even more closely than any heretofore offered. It is based on isothermal flow, and the variation in the value of the coefficient of friction is provided for without complicating the formula, yet permitting the required diameter of line to be ascertained readily.

The expression for the initial velocity of any gas flowing in a pipe is given by Unwin<sup>b</sup> as

$$(1) \quad u_1 = \sqrt{\frac{gC T m (P_1^2 - P_2^2)}{f l P_1^2}}$$

$u_1$ =initial velocity, in feet per second.

$g$ =acceleration due to gravity.

$C$ =thermodynamic constant of the flowing gas  $= \frac{PV}{T}$

$T$ =absolute temperature of gas.

$m$ =hydraulic mean radius of the pipe  $= \frac{D}{4}$ .

$P_1$ =absolute initial pressure of the gas, in pounds per square inch.

$P_2$ =absolute final pressure of the gas, in pounds per square inch.

$f$ =coefficient of friction.

$l$ =length of line, in feet.

<sup>a</sup> Weymouth, T. R., Problems in natural-gas engineering: Trans. Am. Soc. Mech. Eng., vol. 34, 1912, pp. 185-234.

<sup>b</sup> Unwin, W. C., Transmission and distribution of power from central stations, 1892, p. 259.

Let

$C_a$  = thermodynamic constant for air.

$G$  = specific gravity of flowing gas, air = 1.0.

$D$  = diameter of pipe, in feet.

$d$  = diameter of pipe, in inches.

$$\text{Then } C = \frac{C_a}{G}, \text{ and } m = \frac{D}{4} = \frac{d}{48}$$

Hence

$$(2) \quad u_1 = \left[ \frac{g C_a T (P_1^2 - P_2^2) d}{48 G f P_1^2} \right]^{\frac{1}{2}}$$

If  $q$  = quantity of gas flowing per second, based on absolute pressure and temperature of  $P_o$  and  $T_o$ ,

$$A = \text{area of cross section of pipe in square feet} = \frac{\pi d^2}{4 \times 144}$$

Then

$$(3) \quad q = u_1 A \frac{P_1 T_o}{P_o T} = u_1 \left( \frac{\pi d^2}{4 \times 144} \right) \frac{T_o P_1}{P_o T} \left( \frac{\pi}{576} \right) \frac{T_o}{P_o} \left[ \frac{g C_a (P_1^2 - P_2^2) d^5}{48 G T f l} \right]^{\frac{1}{2}}$$

If

$Q$  = flow in cubic feet per hour, based on  $P_o$  and  $T_o$ , and

$L$  = length of line, in miles,

Then

$$l = 5280 L$$

and

$$Q = 3,600 q$$

$$(4) \quad Q = \frac{3,600 \pi}{576 \sqrt{48 \times 5280}} \frac{T_o}{P_o} \sqrt{g C_a \left[ \frac{(P_1^2 - P_2^2) d^5}{G T f L} \right]^{\frac{1}{2}}}$$

Taking  $g = 32.17$  and  $C_a = 53.33$ ,

$$(5) \quad Q = 1.6156 \frac{T_o}{P_o} \left[ \frac{(P_1^2 - P_2^2) d^5}{G T f L} \right]^{\frac{1}{2}}$$

Experiments on the flow of air in pipes of different diameters indicate that the coefficient of friction  $f$  is a variable, decreasing with increasing diameters of line. A great many such experiments have been collected and published in "Compressed Air," by Elmo G. Harris, from which, by the use of equation 5, the coefficients of friction have been computed and plotted in figure 14.

In the reports of these tests no statements were made as to the method of measuring the quantity of gas flowing, and it is quite probable that many of the results are inaccurate in this respect. Notwithstanding this, however, the nature of the variation of  $f$  with the diameter is evident, and the curve represented by the equation

$$f = \frac{0.008}{\sqrt[3]{d}}$$

gives a fair average of the loci of the points plotted. Inserting this value of  $f$  in equation 5, the expression becomes

$$(6) \quad Q = 18.062 \frac{T_o}{P_o} \left[ \frac{(P_1^2 - P_2^2) d^{5\frac{2}{3}}}{G T L} \right]^{\frac{1}{2}}$$

Equation 6 is the general formula for the flow of gas in long pipe lines.

In 1901 Forrest M. Towl conducted an extended test on an 8-inch line, 70 miles long, supplying gas to Buffalo, the results of which were published in a bulletin issued by Columbia University in 1911. Previous to the test the line had been repaired and tested for leaks, and was known to be practically gas-tight. The flow was measured by standardized Pitot tubes, which gave results accurate within less than 1 per cent. The specific gravity  $G$  of the flowing gas was 0.64, its temperature

FIGURE 14.—Curve for coefficient of friction for flow of gas in pipes. Coefficient of friction  $f$  equals  $\frac{0.008}{d^{1.75}}$ , where  $d$  is internal diameter of pipe in inches.

32° F., or  $T=492^\circ$  absolute. The temperature basis on which the gas was measured was 50° F., or  $T_0=510^\circ$  absolute, and the pressure basis was 4 ounces above 14.4 pounds, or  $P_0=14.65$  pounds per square inch absolute. In a length of pipe 70.32 miles long  $P_1$  and  $P_2$  were 210 and 41 pounds per square inch absolute, respectively. The actual diameter of the pipe was 7.981 inches, and the rate of flow by Pitot tube was found to be 221,000 cubic feet per hour.

Inserting these quantities in formula 1 and solving for flow, it becomes

$$Q=221,400 \text{ cubic feet per hour,}$$

or less than 0.2 per cent greater than the actual flow as measured.

Assuming gas standard conditions of measurement basis, namely, 60° F. and 14.65 pounds absolute pressure, and that the average flowing temperature of the gas throughout the year will be 40° F., the formula becomes

$$(7) \quad Q=28.66 \left[ \frac{(P_1^2 - P_2^2) d^{5/4}}{LG} \right]^{1/4}$$

and, if an average specific gravity of 0.60 be assumed,

$$(8) \quad Q=37 \left[ \frac{(P_1^2 - P_2^2) d^{5/4}}{L} \right]^{1/4}$$

Formula 8 is of practical use in designing lines for the transmission of natural gas. It is used as given, or in a transposed form, for all problems relating to single lines of uniform diameter.

FIGURE 15.—Broken curve showing values of equivalent lengths of different diameters of pipe.

If a line is composed of several lengths,  $L_1, L_2, \dots, L_n$ , of diameters  $d_1, d_2, \dots, d_n$ , each of these lengths must be transformed into an equivalent length of one chosen diameter, by means of the formula

$$(9) \quad L_n^1 = L_n \left[ \frac{d_n^1}{d_n} \right]^{5/4}$$

These equivalent lengths added together will give  $L=L_1, L_2, \dots, L_n$ , which is the value for  $L$  in formula 8.

Values of equivalent lengths for different diameters can be most conveniently ascertained by the use of the curves in figure 15, which consist of plots of the values of  $d^5$  for varying values of  $d$ . Values taken from these curves are convenient to use directly in the pipe-line formula, equation 8, whereas they are most simply used in equation 9 as values of the  $5\frac{1}{2}$  power of the diameter ratios.

TABLES.

VOLUME OF FLOW FROM DIFFERENT SIZES OF PIPE AT VARIOUS PRESSURES.

The number of cubic feet of gas of a specific gravity of 0.6 (air equaling 1.0) that will flow from the mouth of a 1-inch pipe in 24 hours is given in Table 10 following. The pressure of the container is taken as 4 ounces above an assumed atmospheric pressure of 14.4 pounds to the square inch, and the temperature of the flowing gas and the container is assumed to be 60° F. If the diameter of the pipe is other than 1 inch, multiply the discharge value given in Table 10 by the square of the actual diameter of the pipe, as found in Table 11.

## CHANGE IN VOLUME OF GAS WITH CHANGE IN TEMPERATURE.

In Table 13 following, the standard is taken at 60° F. and 14.4 inches of mercury plus 0.25=14.65 inches of mercury. Absolute zero=460° F. below freezing=488° below 60° F. The specific gravity of the natural gas is taken at 0.6, air being 1. The same 1,000 cubic feet of gas at 60° F. will measure 1,041 cubic feet at 80° and 959 cubic feet at 40°. The percentage of the decrease and increase below or above 60° F.; the specific gravity of the gas at temperatures below and above 60° F.; also weight of 1,000 cubic feet of gas and air at the different temperatures is shown. For each degree there is a change of 0.002056 in volume.

TABLE 13.—*Change in volume of 1,000 feet of air or natural gas, owing to change in temperature.<sup>a</sup>*

## PUBLICATIONS ON PETROLEUM TECHNOLOGY.

A limited supply of the following publications of the Bureau of Mines has been printed and is available for free distribution until the edition is exhausted. Requests for all publications can not be granted, and to insure equitable distribution applicants are requested to limit their selection to publications that may be of especial interest to them. Requests for publications should be addressed to the Director, Bureau of Mines.

The Bureau of Mines issues a list showing all its publications available for free distribution as well as those obtainable only from the Superintendent of Documents, Government Printing Office, on payment of the price of printing. Interested persons should apply to the Director, Bureau of Mines, for a copy of the latest list.

### PUBLICATIONS AVAILABLE FOR FREE DISTRIBUTION.

BULLETIN 120. Extraction of gasoline from natural gas by absorption methods, by G. A. Burrell, P. M. Biddison, and G. G. Oberfell. 1917. 71 pp., 2 pls., 15 figs.

BULLETIN 134. The use of mud-laden fluid in oil and gas wells, by J. O. Lewis and W. F. McMurray. 1916. 86 pp., 3 pls., 18 figs.

BULLETIN 148. Methods for increasing the recovery of oil from wells, by J. O. Lewis. 1917. 125 pp., 4 pls., 32 figs.

TECHNICAL PAPER 32. The cementing process of excluding water from oil wells, as practiced in California, by Ralph Arnold and V. R. Garfias. 1913. 12 pp., 1 fig.

TECHNICAL PAPER 37. Heavy oil as fuel for internal-combustion engines, by I. C. Allen. 1913. 36 pp.

TECHNICAL PAPER 38. Wastes in the production and utilization of natural gas, and methods for their prevention, by Ralph Arnold and F. G. Clapp. 1913. 29 pp.

TECHNICAL PAPER 42. The prevention of waste of oil and gas from flowing wells in California, with a discussion of special methods used by J. A. Pollard, by Ralph Arnold and V. R. Garfias. 1913. 15 pp., 2 pls., 4 figs.

TECHNICAL PAPER 45. Waste of oil and gas in the Mid-Continent fields, by R. S. Blatchley. 1914. 54 pp., 2 pls., 15 figs.

TECHNICAL PAPER 49. The flash point of oils, methods and apparatus for its determination, by I. C. Allen and A. S. Crossfield. 1913. 31 pp., 2 figs.

TECHNICAL PAPER 66. Mud-laden fluid applied to well drilling, by J. A. Pollard and A. G. Heggem. 1914. 21 pp., 12 figs.

TECHNICAL PAPER 68. Drilling wells in Oklahoma by the mud-laden fluid method, by A. G. Heggem and J. A. Pollard. 1914. 27 pp., 5 figs.

TECHNICAL PAPER 70. Methods of oil recovery in California, by Ralph Arnold and V. R. Garfias. 1914. 57 pp., 7 figs.

TECHNICAL PAPER 72. Problems of the petroleum industry, results of conferences at Pittsburgh, Pa., August 1 and September 10, 1913, by I. C. Allen. 1914. 20 pp.

TECHNICAL PAPER 79. Electric lights for oil and gas wells, by H. H. Clark. 1914. 8 pp.

TECHNICAL PAPER 87. Methods of testing natural gas for gasoline content, by G. A. Burrell and G. W. Jones. 1916. 26 pp., 7 figs.

TECHNICAL PAPER 117. Quantity of gasoline necessary to produce explosive vapors in sewers, by G. A. Burrell and H. T. Boyd. 1916. 18 pp., 4 figs.

TECHNICAL PAPER 127. Hazards in handling gasoline, by G. A. Burrell. 1915. 12 pp.

TECHNICAL PAPER 131. The compressibility of natural gas at high pressures, by G. A. Burrell and I. W. Robertson. 1916. 11 pp., 2 figs.

TECHNICAL PAPER 161. Construction and operation of a single-tube cracking furnace for making gasoline, by C. P. Bowie. 1916. 16 pp., 10 pls.

TECHNICAL PAPER 163. Physical and chemical properties of gasolines sold throughout the United States during the calendar year 1915, by W. F. Rittman, W. A. Jacobs, and E. W. Dean. 1916. 45 pp., 4 figs.

PUBLICATIONS THAT MAY BE OBTAINED ONLY THROUGH THE SUPER-INTENDENT OF DOCUMENTS.

BULLETIN 19. Physical and chemical properties of the petroleum of the San Joaquin Valley, Cal., by I. C. Allen and W. A. Jacobs, with a chapter on analyses of natural gas from the southern California oil fields, by G. A. Burrell. 1911. 60 pp., 2 pls., 10 figs. 10 cents.

BULLETIN 32. Commercial deductions from comparisons of gasoline and alcohol tests on internal-combustion engines, by R. M. Strong. 38 pp. 5 cents.

BULLETIN 43. Comparative fuel values of gasoline and denatured alcohol in internal-combustion engines, by R. M. Strong and Lauson Stone. 1912. 243 pp., 3 pls., 32 figs. 20 cents.

BULLETIN 65. Oil and gas wells through workable coal beds; papers and discussions, by G. S. Rice, O. P. Hood, and others. 1913. 101 pp., 1 pl., 11 figs. 10 cents.

BULLETIN 88. The condensation of gasoline from natural gas, by G. A. Burrell, F. M. Seibert, and G. G. Oberfell. 1915. 106 pp., 6 pls., 18 figs. 15 cents.

BULLETIN 114. Manufacture of gasoline and benzene-toluene from petroleum and other hydrocarbons, by W. F. Rittman, C. B. Dutton, and E. W. Dean, with a bibliography compiled by M. S. Howard. 1916. 268 pp., 9 pls., 45 figs. 35 cents.

BULLETIN 125. The analytical distillation of petroleum, by W. F. Rittman and E. W. Dean. 1916. 79 pp., 1 pl., 16 figs. 15 cents.

TECHNICAL PAPER 3. Specifications for the purchase of fuel oil for the Government, with directions for sampling oil and natural gas, by I. C. Allen. 1911. 13 pp. 5 cents.

TECHNICAL PAPER 10. Liquefied products of natural gas, their properties and uses, by I. C. Allen and G. A. Burrell. 1912. 23 pp. 5 cents.

TECHNICAL PAPER 25. Methods for the determination of water in petroleum and its products, by I. C. Allen and W. A. Jacobs. 1912. 13 pp., 2 figs. 5 cents.

TECHNICAL PAPER 26. Methods for the determination of the sulphur content of fuels, especially petroleum products, by I. C. Allen and I. W. Robertson. 1912. 13 pp., 1 fig. 5 cents.

TECHNICAL PAPER 36. The preparation of specifications for petroleum products, by I. C. Allen. 1913. 12 pp. 5 cents.

TECHNICAL PAPER 51. Possible causes of the decline of oil wells, and suggested methods of prolonging yield, by L. G. Huntley. 1913. 32 pp., 9 figs. 5 cents.

TECHNICAL PAPER 53. Proposed regulations for the drilling of oil and gas wells, with comments thereon, by O. P. Hood and A. G. Heggem. 1913. 28 pp., 2 figs. 5 cents.

TECHNICAL PAPER 57. A preliminary report on the utilization of petroleum and natural gas in Wyoming, by W. R. Calvert, with a discusseion of the suitability of natural gas for making gasoline, by G. A. Burrell. 1913. 23 pp. 5 cents.

TECHNICAL PAPER 74. Physical and chemical properties of the petroleum of California, by I. C. Allen, W. A. Jacobs, A. S. Crossfield, and R. R. Matthews. 1914. 38 pp., 1 fig. 5 cents.

TECHNICAL PAPER 104. Analysis of natural gas and illuminating gas by fractional distillation in a vacuum at low temperatures and pressures, by G. A. Burrell, F. M. Seibert, and I. W. Robertson. 1915. 41 pp., 7 figs. 5 cents.

TECHNICAL PAPER 109. Composition of the natural gas used in 25 cities, with a discussion of the properties of natural gas, by G. A. Burrell and G. G. Oberfell. 1915. 22 pp. 5 cents.

TECHNICAL PAPER 115. Inflammability of mixtures of gasoline vapor and air, by G. A. Burrell and H. T. Boyd. 1915. 18 pp., 2 figs. 5 cents.

TECHNICAL PAPER 120. A bibliography of the chemistry of gas manufacture, by W. F. Rittman and M. C. Whittaker, compiled and arranged by M. S. Howard. 1915. 30 pp. 5 cents.

TECHNICAL PAPER 130. Underground wastes in oil and gas fields and methods of prevention, by W. F. McMurray and J. O. Lewis. 1916. 28 pp., 1 pl., 8 figs. 5 cents.

5

By E. W. Dean.

## FOREWORD.

This report is issued as a revised edition of Technical Paper 166, on the properties and testing of gasoline. Discussion that has lost its significance since the date of issue of Technical Paper 166 has been omitted, and much information has been added that has become of recent importance.

With conditions in the oil refining and marketing industries even more unsettled than they were at the time of issue of Technical Paper 166, anything approximating a last word on the subject treated is impossible. But because of the need of keeping the public in touch with this important and rapidly developing technical field the Bureau of Mines issues this report.

## INTRODUCTION.

One of the most desirable conditions to be attained in the development of technical or commercial undertakings is that producers and users shall be able to determine the relative desirability of commodities on the basis of simple and accurate tests. Up to a recent date such a condition has not been reached in regard to gasoline and it was believed that satisfactory specifications, based on laboratory tests, could not be written for commercial transactions in this commodity. Claims were frequently made that actual use constituted the only adequate test for the value of gasoline.

It is now definitely established that the most unreliable test in vogue for gasoline is that of the average user who "tries it out" in his car. Engine tests, if conducted in the laboratory in connection with power measurements, are still the last word in determining the utility of motor fuel, but the internal-combustion motor is so complex a mechanism that it can not be made to serve as an analytical instrument except when handled by experts. Properly interpreted results of an analysis in the chemical laboratory give more reliable information concerning the utility of a grade of gasoline than  
6 anything less than the most elaborately conducted engine-dynamometer tests, or the collective experience of a large number of users.

In the course of the past two or three years rational methods for analyzing and grading gasoline have come into vogue. Published descriptions are not, however, readily available and in addition many of the methods, though based on sound theoretical principles, have not been developed to an optimum of simplicity and reliability. The object of the present paper is to furnish information regarding the desirable properties of gasoline and the best methods of testing it. Suggestions are offered with regard to rational specifications and the interpretation to be placed upon the requirements that may be adopted.

#### ACKNOWLEDGMENT.

The bureau began its study of gasoline specifications at the suggestion of W. A. Williams, formerly chief petroleum technologist of the bureau. Much credit is due Mr. Williams and his successor, Chester Naramore, for assistance and advice in preparing this report.

To Van. H. Manning, director of the bureau, who has shown particular interest in the problem, credit is due for guidance in assembling a large part of the material presented.

W. A. Jacobs, H. H. Hill, and C. R. Bopp, of the petroleum division of the bureau, collected and analyzed samples of gasoline, thereby obtaining information of utmost importance in connection with the discussion and recommendations of this report.

Many of the tests and analytical methods described are based on the experimental work of chemists and petroleum technologists who have been kind enough to cooperate with the bureau in furnishing information. Acknowledgment of credit due these men is made in connection with descriptions of the tests.

#### NEED OF GASOLINE SPECIFICATIONS.

The bureau was originally asked to prepare specifications for Government purchases of several grades of gasoline and naphtha, and to guide State and local legislative bodies that proposed to formulate regulations for controlling the quality of gasoline. More lately the bureau has assisted in preparing specifications for the purchase of gasoline for military purposes, particularly for the Aviation Service.

#### GENERAL PROPERTIES OF SATISFACTORY GASOLINE.

The fundamental principle upon which gasoline tests and

specifications must be based is that quality is not inherent but is determined by the service required. For instance, gasoline that is entirely satisfactory in present-day cars or trucks might have been almost useless in the cars of several years ago and would not serve in airplane motors at all. Hence a discussion of the desirable properties of gasoline must be confined to general statements, and then if reduced to specifications must take into account the conditions of use. The essentially desirable properties of gasoline may be summarized briefly as follows:

1. The gasoline should not contain too large a percentage of highly volatile products, which tend to cause large evaporation losses and excessive danger in handling and storage, but should have enough volatile constituents to permit starting an engine under reasonably unfavorable conditions, without preheating.

2. The gasoline should not contain any considerable percentages of heavy or nonvolatile constituents, which after atomization into the engine cylinders can not be completely vaporized and burned.

3. The gasoline should not contain material that after combustion leaves a residue that collects in the motor.

4. The gasoline should be free from substances that attack metal, either before or after combustion. Unremoved acid (used in refining) falls under this head.

5. Neither the gasoline nor its products of combustion should have a strong or markedly disagreeable odor, as this is objectionable to users of automobiles.

6. The gasoline should be free from noncombustible material such as water and sediment.

These stated requirements are simple in principle and are almost axiomatic. The chief problem is to fix limits, defined by actual tests, that will satisfy the desirable conditions.

#### TYPES OF GASOLINE MARKETING AND THEIR GENERAL PROPERTIES.

There are at present on the market types of gasoline produced by several general methods. These may be classified as follows:

1. "Straight refinery" gasoline.
2. Blended "casing-head" gasoline.
3. "Cracked" and blended gasolines.

*"Straight" Refinery Gasoline.*

"Straight" refinery gasolines are produced by methods that vary somewhat in different parts of the country, but in general are similar. Crude oil is distilled in a fire still until the gravity of the condensed product reaches some predetermined mark. The distillate, so-called crude naphtha or benzine, is acid refined, neutralized, washed and steam distilled. Several products of different ranges of volatility may be produced from the crude naphtha, or the steam distillation  
8 may separate the gasoline from the less volatile "bottoms" that go into the kerosene or burning-oil stock.

Straight refinery gasolines are generally characterized by a low content of "unsaturated"<sup>a</sup> and aromatic hydrocarbons and by a distillation curve of characteristic form, free from marked irregularities. The distillation curve of a typical straight refinery motor gasoline appears later in this paper on Form 2 (see page 29), the sheet used by the bureau for keeping graphic records of distillation analyses of gasoline.

*Blended Casing-head Gasoline.*

During the past few years so-called casing-head gasoline, obtained from natural gas by compression or absorption processes, has come on the market. "Straight" casing-head gasoline, especially that produced by the compression process, is usually too volatile for general use and, before being marketed, is blended with enough heavy naphtha to produce a mixture that can be used safely as motor fuel. In general, blended casing-head gasoline is characterized by a volatility range that shows a considerable percentage of constituents of relatively low boiling point, and a high "end point." The characteristic curve of a blended casing-head gasoline appears on Form 2, to which reference has already been made. Frequently, however, the blending is done in a manner difficult to detect; the natural gas gasoline is used in moderately small proportion with "heavy" straight refinery naphtha in order to make a product with a desirable percentage of volatile constituents.

As regards chemical properties, blended casing-head gasoline seems to be identical with straight refinery products of the same distillation range, provided the comparison is limited to derivatives of the same or similar producing fields.

---

(a) The term unsaturated is generally understood to include olefins and poly-olefins. The general chemical formula for the olefin series of hydrocarbons is  $C_nH_{2n}$ . Aromatic hydrocarbons occurring in gasoline generally fall in the benzene series, having the general chemical formula  $C_nH_{2n-6}$ .

Characteristic physical properties of these gasolines are due wholly to the details of blending.

*Cracked or Synthetic Gasoline.*

"Cracked" or synthetic gasoline is an important factor in the present market supply of motor fuel and is being produced in large quantities. It is generally sold in the form of blends with varying proportions of straight refinery and casing-head gasoline.

Cracked gasolines are similar to straight refinery products in some physical and chemical properties, but differ in the matter of containing varying proportions of unsaturated hydrocarbons.<sup>a</sup> The utility of these constituents has not yet been completely determined. It appears that they have balanced advantages and disadvantages, and it is not as yet safe to predict the degree of satisfaction with which cracked products of relatively high "degree of unsaturation"<sup>b</sup> can be used in general service. Thus far, however, these products have been marketed in the form of blends that are perfectly satisfactory and are generally used without knowledge that they contain cracked gasoline.

PROPERTIES OF GASOLINE AND METHODS OF TESTING.

Before a system of analysis and specifications is outlined it seems desirable to discuss the individual properties that might be considered important and to describe analytical methods. This paper is not intended as a complete review of gasoline analysis, and those properties that are considered of minor practical importance are not discussed in detail.

*Color.*

Color is of some importance because it serves as an index of other qualities. Properly refined gasolines are "water white," and hence it is often desirable to include a color requirement in specifications for gasoline. It does not, however, seem necessary to employ a test involving any sort of a tintometer, as the rough-and-ready method of looking through the

(a) Aromatic hydrocarbons also occur in smaller degree in cracked gasoline, but for reasons involving economy in production the yield of these hydrocarbons is generally minimized.

(b) Highly unsaturated cracked gasoline shows a loss through treatment with an excess of cold concentrated sulphuric acid which in some cases runs as high as 40 per cent. The blends usually marketed are, however, less than 8 per cent "unsaturated."

bottom of a 4-ounce sample bottle<sup>a</sup> or 100 c. c. graduate is adequate.

#### *Odor.*

Gasoline should be free from a rank or disagreeable odor, as such odor causes discomfort to users, especially if it has a tendency to cling to clothing. Of course, one can not fix a definite standard of quality and strength for odor. The older requirements demanded the sweet, pleasant odor characteristic of "high-test" uncracked distillates. With the present necessity of using cracked gasoline this requirement has become impossible and the requirement of odor must be omitted or left rather indefinite.

#### 10 *Water, Sediment, and Other Foreign Matter.*

Gasoline should obviously be free from water and other foreign matter. Water is seldom present in gasoline and is always easy to detect, as the two liquids are mutually insoluble. Sediment is equally easy to detect on account of the transparency of gasoline.

#### *Acidity.*

Obviously gasoline should not contain any of the acid used during the refining process. Market products rarely fail to meet this requirement, which is so important that a test should always be made. A simple and effective method of detecting acidity is to shake the residue in the Engler flask, after an analytical distillation, with a little distilled water, and then to test this water extract with a suitable indicator, such as litmus, methyl orange, or phenolphthalein. Shaking the original sample with water does not serve to detect acid that is chemically combined with the gasoline, and this test, although recommended in Technical Paper 166, seems to be practically useless.

#### *Calorific or Heating Value.*

The value of motor fuel is a function of its heating value or B. t. u. value. The differences in heating value among varieties of gasoline are relatively small, and this property is, therefore, not important enough to merit determination in the routine testing of gasoline. Some recent experiments of

---

(a) The oil industry commonly employs a cylindrical 4-ounce bottle of the following approximate outside dimensions: Height of body 5½ inches, diameter of body 1½ inches, height of neck ¾ inch, diameter of neck ¾ inch.

the Bureau of Mines<sup>a</sup> indicated that a straight refinery gasoline, with a gravity of 74° B., was about 1.3 per cent higher in heating value than a cracked gasoline, with a gravity of 58° B., on the basis of weight and about 7 per cent lower on the basis of volume. Seemingly the heavier and less volatile gasolines are actually superior to the high-test light products as regards potential power production per gallon. This assumption, of course, implies equal efficiency in utilization.

*Content of Aromatic Hydrocarbons--Benzene, Toluene, and Others.*

The desirability of aromatic hydrocarbons as motor fuel is a question that is already receiving attention. The commercial production of sufficient toluene to meet the needs of the explosives industry has yielded an excess of the benzene and solvent naphtha fractions of light oil and new methods of utilizing these products are being sought. The total available quantity of these aromatic hydrocarbons is small in relation to the country's production of gasoline, but it is important, especially in localities where coal is coked in by-product ovens.

The utility of aromatic hydrocarbons as motor fuel has already been studied to some extent. On the basis of present evidence, these products, although chemically different from petroleum hydrocarbons, appear to have properties that give certain advantages in utilization. This problem merits discussion beyond the scope of the present paper; however, the evidence at hand indicates that if aromatic hydrocarbons appear in the American market as motor fuel in the future, users will be benefited.

The percentage of aromatic hydrocarbons permissible in gasoline for use in the average automobile motor may be necessarily limited to some maximum that has been proven desirable by experience. The relatively high freezing point of pure benzene (5.5° C. or 42° F.) is one factor that may necessitate such a limitation, which can probably be effected most simply by a gravity requirement. Aromatic hydrocarbons—benzene, toluene, and the others—have specific gravities of about 0.87 to 0.88 (29° to 30° B.) and distill at the same temperatures as petroleum hydrocarbons having specific grav-

(a) Rittman, W. F., Jacobs, W. A., and Dean, E. W., Physical and chemical properties of gasolines sold throughout the United States during the calendar year 1915: Tech. Paper 163, Bureau of Mines, 1916, 45 pp. Refer to Table 7, p. 18.

ities between 0.70 and 0.76 (54° to 70° B.). Therefore, an approximate idea of the percentage of aromatics in a mixture can be obtained through the relation between figures for distillation range and specific gravity.

### *Unsaturated Hydrocarbons.*

Another matter that has not been worked out completely is the effect of unsaturated hydrocarbons on the properties of gasoline. As already stated, there is conclusive evidence showing that gasolines containing moderate percentages of unsaturated hydrocarbons can be used with entire satisfaction, but it has not yet been definitely established that the presence of unlimited proportions of these constituents causes no disadvantage.

In view of the present market conditions it does not seem desirable to emphasize any requirements that may interfere with the development of cracking processes, as this now seems to offer the greatest possibility of conserving the country's petroleum resources.

The bureau has recently published as Technical Paper 181<sup>a</sup> the results of a study of the comparative advantages of various analytical methods employed for determining "degree of unsaturation." This study has shown that the acid-heat test largely used by refiners is little better than qualitative and that determinations of iodine absorption by the Hanus method, though accurate and fairly rapid, requires a fair degree of manipulative skill on the part of the operator. The

measurement of the percentage absorbed by concentrated 12 sulphuric acid seems on the whole the most practical

method of ascertaining the degree of unsaturation of a gasoline, provided the details of this test are properly conducted. It must, however, be understood that this percentage value is not the actual olefin content of the gasoline.<sup>b</sup>

### *Specific Gravity.*

Specific gravity is in itself of very slight significance in determining the properties of gasoline, except as noted in the discussion of mixtures containing aromatic hydrocarbons. Gravity may serve as an index of other properties, particular-

(b) Brooks, B. T., and Humphrey, Irwin, The action of concentrated sulphuric acid on olefins, with particular reference to the refining of petroleum distillates: Jour. Am. Chem. Soc., vol. 40, May, 1918, pp. 822-856.

ly volatility, if knowledge is at hand regarding the source and method of production of a sample of gasoline.

Gasolines of equivalent volatility from the Pennsylvania and California fields may have gravities differing as much as 8° Baume'. Figures indicating this fact appear in Technical Paper 163<sup>a</sup> of the Bureau of Mines. In addition gravity measurements do not differentiate straight refinery and blended casing-head gasolines, which may vary widely in actual composition.

The determination of gravity has been, and probably always will be one of the most useful tests that the refiner employs, but it is of little value to the analyst who does not possess enough additional information to make proper interpretation of gravity results.

Methods of determining gravity are too well known to need discussion. The type of instrument chosen may be a hydrometer, a displacement balance (such as the Westphal), or a suitable pycnometer. Of these instruments the hydrometer is perhaps most convenient, the pycnometer least convenient. The accuracy in determination should be within 0.1 to 0.2 per cent. The oil industry expresses gravity as the ratio of the densities of oil and water at the temperature of 60° F.

In some laboratories the accepted practice is to use the temperature of 15° C. (59° F.) instead of 60° F. The discrepancy thus introduced is, however, generally less than the experimental error in measurement.

#### *Volatility.*

Volatility is the basic property that determines the grade and usefulness of gasoline. Unfortunately, it is a complex property, the grade and usefulness of which can not be stated in a few words, as different ranges of volatility are desirable for different conditions of use and these are subject to wide variation. Thus it may be noted that the same type of 13 gasoline is not equally desirable for airplane and truck motors, and that the type of motor fuel that would be most suitable for use in the Canal Zone might not give good results in Alaska. Hence, it is easily seen that a discussion of the desirable properties of volatility must necessarily be confined to generalities. There are, however, certain simple basic principles that merit brief consideration.

---

(a) Rittman, W. F., Jacobs, W. A., and Dean, E. W., Physical and chemical properties of gasolines sold throughout the United States during the calendar year 1915: Tech. Paper 163, Bureau of Mines, 1916, p. 32.

In the first place, it is desirable to use as cheap a gasoline as can be made to yield satisfactory results. The men who have to pay for maintaining cars in service need no argument in support of this statement, and it is equally sound from another and broader point of view. In the interest of conservation it is desirable to draw lightly upon natural resources that are limited and to use, whenever possible, materials that are abundant. The more volatile fractions that go to make up gasoline are less plentiful and more expensive than the heavier constituents that are on the border line between gasoline and kerosene or burning oil.

Gasoline should, therefore, contain a moderate but not excessive proportion of low-boiling constituents. There should be sufficient volatile material to permit ready starting of a cold motor, but not enough to make the gasoline subject to high evaporation losses and unnecessarily costly, or dangerous in handling. The limitation of quantity of low-boiling constituents is particularly important in airplane gasoline as it obviates certain irregularities in carburetion that may occur at high altitudes, and reduces somewhat the danger of fire in case of leakage or breaking of supply tanks.

Ordinary motor gasoline should have a total volatility range wide enough to include constituents of relatively high-boiling points. For economic reasons of importance both to the individual user and the country as a whole, this volatility range should be such that the gasoline contains the largest possible percentage of the original crude oil. However, the range should not be wide enough to exceed the limits of the vaporizing power of the engine. These limits obviously vary with types of motor design and conditions of use. Thus it would be expensive folly to specify the same grade of gasoline for a motor truck that is required for delicately adjusted airplane engines designed to run most efficiently at altitudes ranging from 10,000 to 20,000 feet.

The general method of determining volatility is to subject gasoline to an analytical distillation. The results obtained are a function of the apparatus and method used as well as of the gasoline itself, and the method used should always be specified as well as the results. Distillation figures resemble flash-point figures in that in themselves they mean little. In

either case the method and apparatus used should be  
14 stated. For example, it should be said a gasoline has a certain distillation range with the A. S. T. M. method,

just as it is customary to say that an oil has a given flash point in the Pensky-Martens closed-cup tester.

### *Distillation Methods.*

Numerous distillation methods are in use in the petroleum industry, many of them undesirable and a small number of them based on sound practical requirements. No one distillation method is good for all purposes and in issuing this report the bureau has been forced to select one of several methods having strong claims for superiority. The most general need seems to be for a distillation method that will serve to differentiate gasolines reliably and that does not require too elaborate apparatus or too tedious manipulation. The American Society for Testing Materials has had occasion to adopt for the analysis of turpentine substitutes a method that seems to strike the right combination of simplicity and efficiency and is based on sound theoretical principles. To adapt this method to gasoline testing a few minor changes were necessary, the the most important being the substitution of a thermometer better adapted to gasoline distillation than the 400° C. instrument specified by the society, and the reading of temperatures as given amounts distill instead of reading the percentages distilling between given temperature limits.

### REVIEW OF THE GASOLINE SITUATION.

Before a system of actual specifications is discussed, it seems desirable to summarize the status of the gasoline market in January, 1919. During the last year or two the total production of refinable crude oil has not increased notably, although the demand for gasoline has continued to grow. The supply of gasoline has kept pace with the demand chiefly because of the use as motor fuel of a greater proportion of the crude oil refined. Cracking processes have helped to increase the supply, as also the recovery of gasoline from natural gas. In addition, many refiners have augmented their production by what is called "cutting deeper into the crude." Some of the fractions of petroleum that were formerly marketed under other names and for other purposes are now sold as gasoline, thus in effect increasing gasoline production. This practice has occasioned some discontent among users of cars, and statements are frequently made that motor gasoline now marketed has deteriorated in quality or has been adulterated. The Bureau of Mines has never detected an actual case of adultera-

tion among several hundred samples of gasoline collected in the open market, and is of the opinion that the change in quality is not necessarily a deterioration. In any event  
 15 users are getting better value for their money than they would if the older types of "high-test" gasolines were commonly supplied in the market.<sup>a</sup>

Gasoline producing and refining practice, which has been in a stage of transition during the last three or four years, is even now unsettled and information regarding the general situation is not in the possession of the bureau. During the calendar year 1917, when a survey of the country was made, gasoline marketed on the West Coast was more volatile than in the East, which in turn was more volatile than the type generally supplied in the Middle States. Some recent information indicates that this general condition still exists, but that there is a tendency toward the general adoption of Mid-Continent standards.

#### GENERAL CONSIDERATIONS IN PREPARING GASOLINE SPECIFICATIONS.

Through different sources the Bureau of Mines has been asked to assist in preparing gasoline specifications. The primary need was for Federal purchases in the District of Columbia. Later there were received requests for advice from State and municipal authorities who were contemplating the adoption of legal standards for regulating the quality of gasoline. Finally, the bureau had been required to aid in formulating specifications for various grades of gasoline required for military purposes.

In every instance the study of the following two important problems was necessary: (1) what particular type or types of gasoline were needed, and (2) how nearly the requirements could be satisfied in the market. As regards some gasoline, particularly that needed by the aviation service, the specification of grades that involve special refinery procedure was necessary. Generally, however, suitable grades were found in the market.

##### *Limits and Requirements of Gasoline Specifications.*

An ideal system of specifications would, by a minimum of simple requirements, eliminate all unsatisfactory products

---

(a) For a detailed discussion of this subject see Dean, E. W.: Fuel for automotive apparatus, Jour. Soc. Automotive Eng., vol. 2, January, 1918, pp. 47 to 53.

without discriminating against any that are desirable. This ideal is impossible to attain for gasoline, partly because no hard and fast line differentiates good gasoline from bad, and partly because a satisfactorily simple specification can not cover all possible sources of discrepancy. In general, however, the tests discussed later furnish an adequate index of quality for the normal products marketed as gasoline, and will probably be satisfactory until such time as new and unforeseen developments occur in the refining industry.

The requirements that are considered adequate for regulating the quality of gasoline sold for domestic use are color, freedom from corrosive agents, and volatility. Color is in itself of minor importance but generally, though not infallibly, indicates whether a gasoline is properly refined. At present refiners show little tendency to market gasolines that do not meet this requirement. The requirement of freedom from corrosive agents is important, and the simple test or tests for this property should be made even though the almost universal care taken by refiners has made it unnecessary.

In deciding upon a system of volatility limits two general factors must be considered. It is obvious that the points taken in the volatility range must be so selected as to define it. A specification that fixed only the initial boiling temperature and the 20 per cent mark would be practically useless; likewise a specification fixing only the upper distillation limit would be totally inadequate in determining the actual volatility range of gasoline. Therefore the volatility limits should include points both at the low and high ends of the distillation range. In addition limitation of some point in the middle of the curve is desirable as there are moderate possibilities of variation even if the ends of the curve are defined.

The second general consideration is that limits should be selected that permit easy and reliable measurement in the laboratory. The common practice in the industry has been to lay emphasis on so-called "initial" and "final" boiling temperatures. These points, particularly the former, are exceedingly difficult to determine with precision. Countless disputes and disagreements have occurred because of attempts to specify volatility in terms of these two troublesome points. Experience has shown that the various percentage marks between the limits of 10 and 90 per cent are easy to determine reliably, and that even as low a mark as the 5 per cent point is notably more reliable than the initial boiling point. In its own laboratories the Bureau of Mines has had little trouble in getting

check results in "dry-point" (one definition of final boiling temperature) determinations, but has been informed of numerous discrepancies among the results of different analytical laboratories. The bureau believes that specifications may require the measurement of final boiling temperature but that this limit should allow a sufficiently wide margin so that discrepancies in laboratory determinations will not discriminate against any properly refined gasolines that have a satisfactory 90 per cent mark.

The bureau recommends fixing the more volatile (low boiling) end of the distillation range by placing an upper and a lower limit on some selected temperature mark between the limits of 5 per cent and 20 per cent. The upper limit is necessary to insure the presence in the gasoline of enough low-boiling constituents to permit ready starting of a cold motor. The lower limit is to prevent the marketing of gasolines that are unnecessarily dangerous and subject to high evaporation losses. As regards facility of examination in the laboratory, the 20 per cent limit is most desirable, but if close regulation of quality is desired, as for aviation gasoline, it may be advisable to take a mark as low as the 5 per cent point.

#### PROPOSED SPECIFICATIONS FOR GASOLINE.

As already stated, the bureau believes that no one set of specifications is satisfactory for all needs. The following system is suggested, however, as a simple and satisfactory scheme for regulating the quality of ordinary automobile gasoline:

##### COLOR.

Requirements.—Water white.

Method of determination.—Inspection of the vertical column in a 4-ounce sample bottle or 100 c. c. graduate.

##### *Discussion.*

This simple test furnishes a fair but not infallible indication as to the care with which gasoline is refined.

##### ACIDITY.

Requirement.—Total absence of free or combined acid.

Method of determination.—The residue in the flask after completion of an analytical distillation shall be shaken thoroughly with 1 c. c. of distilled water. The water extract shall

be neutral in reaction. This may be determined by the use of any satisfactory indicator. Freedom from acidity is indicated by failure to color blue litmus paper pink, by failure to develop a reddish color when a few drops of methyl orange solution is added, or by the development of a red color on addition of a few drops of phenolphthalein solution and one drop of hundredth normal sodium hydroxide solution.

#### *Discussion.*

The experience of the Bureau of Mines indicates that an acid reaction is rarely or never discovered when the original gasoline is shaken with distilled water and the aqueous extract tested with a suitable indicator. Information<sup>a</sup> has been received that carelessly refined gasoline sometimes contains 18 acid compounds that decompose in the course of the distillation and leave free acid in the residue in the flask. This has led to recommendation of the test described above rather than the test given in Technical Paper 166.

#### VOLATILITY.

Requirements.—The gasoline shall, when distilled by the method described hereafter, meet the following requirements:

(a) The temperature read on the thermometer when 20 per cent has distilled shall not be below 70° C. (158° F.), nor above whatever limit is fixed after due consideration of conditions of use.

(b) The temperature read when 90 per cent has distilled shall not be above another limit similarly chosen.

(c) The temperature read when 50 per cent has distilled shall not be higher than a mark halfway between the upper 20 per cent limit and the 90 per cent limit.

(d) The dry point shall not exceed the 90 per cent limit by more than 40° C. (72° F.).

#### *Discussion of Temperature Limits.*

Several of the marks specified need not necessarily be fixed exactly as indicated above. The Bureau of Mines considers the 20 per cent point the most satisfactory low limit but recognizes that there is no great advantage over any other

---

(a) Chemists of the Atlantic Refining Co. have advised the bureau that an acid reaction is sometimes discovered in the distillation residue when the original product appears to be neutral.

point between 5 per cent and 20 per cent. The 50 per cent point is recommended simply because no other intermediate point seems preferable. The 90 per cent point has been proven by experience to be the highest mark that is not likely to vary with slight discrepancies in experimental operation. "Dry point" is one of several possible definitions of final boiling temperature. The experience of the bureau has been that this point offers the greatest possibility of experimental agreement of the various marks used for final boiling temperature, but that it is difficult to formulate a definition that renders misunderstanding impossible. The bureau does not *not* approve of the definition that involves reading the temperature as the bottom of the flask goes dry or when a puff of white vapor is observed. Any percentage point between the limits of 96 to 98 per cent, however, may be used as a final mark, but care must be taken not to label it a "dry point."

#### DISTILLATION METHOD AND APPARATUS.

The distillation method recommended by the bureau is approximately that adopted by Subcommittee XI of Committee D1 of the American Society for Testing Materials.<sup>a</sup>

The two noticeable points of variation are the method of reading temperatures against fixed percentage points and the use of a thermometer of lower range. The method of the society is proposed for the analysis of turpentine substitutes which are petroleum products of higher boiling range than gasoline.

The apparatus used should be as follows. The particular form employed by the bureau is represented in figure 1 and differs somewhat in appearance, though not in the essential details, from that generally supplied in the market for this test.

---

(a) American Society for Testing Materials, Year Book for 1915, pp. 568-569; or pt. 1, Committee Reports, 1916, vol. 16, pp. 518-521.

FIGURE 1.—Apparatus used by the Bureau of Mines for distillation test of gasoline. (a) Wires connecting with electric mains through a suitable rheostat. (b) Electric heater. (c) Engler distillation flask filled with charge of gasoline partly distilled. (d) Thermometer. (e) Condenser, with trough filled with ice and water. (f) Receiving graduate. (g) Cock for draining condenser trough.

### Flask.

The flask used shall be the standard 100 c. c. Engler flask, described in the various textbooks on petroleum. Dimensions (outside) are as follows:

#### Dimensions of flask.

Dimensions.	Cm.	Inches.
Diameter of bulb.....	6.5	2.56
Diameter of neck.....	1.6	0.63
Length of neck.....	15.0	5.91
Length of vapor tube.....	10.0	3.94
Diameter of vapor tube.....	0.6	0.24

- 20 Position of vapor tube, 9 cm. (3.55 inches) above the surface of the gasoline when the flask contains its charge of 100 c. c. The tube is approximately in the middle of the neck.

The flask shall be supported on a ring of asbestos having a circular opening  $1\frac{1}{4}$  inches in diameter; this means that

only this limited portion of the flask is to be heated. The use of wire gauze or a sand bath is not approved.

*Condenser.*

The condenser shall consist of a thin walled tube of metal (brass or copper) approximately one-half inch internal diameter and 22 inches long. It shall be set at an angle of  $75^{\circ}$  from the perpendicular and shall be surrounded with a cooling jacket of the trough type. The lower end of the condenser shall be cut off at an acute angle and shall be curved down for a length of 3 inches. The condenser jacket shall be 15 inches long.

*Thermometer.*

The accuracy of distillation depends primarily on the accuracy of the thermometer and on this account the instrument should be defined so that the results of different analysts may check. The thermometer described in the report of the American Society for Testing Materials is not adapted for use with gasoline. Its range is unnecessarily high and the lower temperatures are difficult to read, because of interference of the cork in the neck of the distillation flask.

The present discussion does not deal with the details of temperature measurement, but simply indicates requirements that should be met and that will insure the maximum variations in thermometer readings at different analytical laboratories not to exceed  $1^{\circ}$  to  $2^{\circ}$  C.

Briefly, the thermometer should be an accurate nitrogen-filled instrument with a short blub (length 10 to 15 mm., 0.39 to 0.59 inch) and with the mark for  $35^{\circ}$  C. ( $95^{\circ}$  F.) at a distance between 100 and 120 mm. (3.94 to 4.75 inches) from the top of the bulb. The thermometer should be scaled for total immersion.

The above requirements almost always permit the lowest temperature registered to be read above the cork of the distillation flask, and variations due to the so-called stem correction will always be practically the same. The stem correction should not be applied, but it should be understood that results of distillations are expressed in terms of thermometer readings and not in terms of actual temperatures. The use of partial-immersion thermometers is not recommended for distillations, as these instruments are no more likely to agree with one another than are the more common total-immersion thermometers.

The following specification for a gasoline distillation thermometer is offered so that the prospective purchaser may be able to state definitely what he requires and by so doing obtain a satisfactory instrument. The specification has been submitted to several manufacturers of thermometers, who state that it insures the obtaining of a satisfactory high-grade instrument without imposing on the maker unnecessary and troublesome restrictions that increase the cost.

*Specifications for Gasoline Distillation Thermometer.*

The thermometer should be made of selected enamel-backed tubing having a diameter between 5.5 and 7 mm. The bulb should be of Jena normal or Corning normal glass; its diameter should be less than that of the stem and its length between 10 and 15 mm. The total length of the thermometer should be approximately 380 mm. The range should cover 0° C. to 270° C., with the length of the graduated portion between the limits of 210 to 250 mm. The point marking a temperature of 35° C. should be not less than 100 mm. nor more than 120 mm. from the top of the bulb.<sup>a</sup>

The scale should be graduated for total immersion. The accuracy must be within about 0.5° C. The space above the meniscus must be filled with an inert gas, such as nitrogen, and the stem and bulb must be thoroughly aged and annealed before being graduated.

All material and workmanship must be of the best. The scale shall be marked for single-degree intervals. Each tenth degree shall be numbered and each fifth degree distinguished by a longer mark.

*Source of Heat in Gasoline Distillation.*

The source of heat in distilling gasoline may be a gas burner, an alcohol lamp, or an electric heater. The commonly used Tirrell type of gas burner is moderately satisfactory, but a burner having a smaller orifice and more sensitive regulating valve is more desirable. Such a burner has been developed and is used by the Philadelphia laboratory of the Atlantic Refining Co., and is described and shown in diagram in a recent journal article<sup>b</sup> published by permission of the bureau.

(a) If desired, a Fahrenheit thermometer may be obtained on these specifications by substituting Fahrenheit equivalents for the several centigrade marks.

(b) Dean, E. W., A convenient electric heater for use in the analytical distillation of gasoline: Jour. Ind. and Eng. Chem., vol. 10 (October, 1918), pp. 823-826.

Alcohol lamps may be employed in laboratories lacking a satisfactory gas supply. A type that has been tried by the bureau and found satisfactory is sold by the C. J. Tagliabue Mfg. Co., Brooklyn, N. Y. For the bulk of its own work the bureau has used specially designed and constructed electric heaters which have proved considerably more satisfactory than either gas or alcohol burners. This type of electric heater is described 22 in the journal article referred to in connection with the Atlantic Refining Co. gas burner.

Electric heaters are superior to the other types in that they permit more exact regulation of the degree of heat, are not subject to serious uncontrollable fluctuation (such as is caused by air currents) and involve a minimum danger of fire.

#### PROCEDURE AND DETAILS OF MANIPULATION IN CONDUCTING DISTILLATIONS.

1. If an electric heater is used it is started first to warm it.

2. The condenser box is filled with water containing a liberal proportion of cracked ice.

3. The charge of gasoline is measured into the Engler flask from a 100 c. c. graduate. This graduate is used as a receiver for distillates without any drying. This procedure eliminates errors due to incorrect sealing of graduates and also avoids the creation of an apparent distillation loss due to the impossibility of draining the gasoline entirely from the graduate.

4. The above-mentioned graduate is placed under the lower end of the condenser tube so that the latter extends downward below the top of the graduate at least 1 inch. The condenser tube should be so shaped and bent that the tip can touch the wall of the graduate on the side adjacent to the condenser box. This detail permits distillates to run down the side of the graduate and avoids disturbance of the meniscus caused by the falling of drops. The graduate is moved occasionally to permit the operator to ascertain that the speed of distillation is right, as indicated by the rate at which drops fall. The proper rate is from 4 c. c. to 5 c. c. per minute, which is approximately two drops a second. The top of the graduate is covered, preferably by several thicknesses of filter paper, the condenser tube passing through a snugly fitting opening. This minimizes evaporation losses due to circulation of air

through the graduate and also excludes any water that may drip down the outside of the condenser tube on account of condensation on the ice-cooled condenser box.

5. A boiling stone (a bit of unglazed porcelain or other porous material) is dropped into the gasoline in the Engler flask. The thermometer, equipped with a well-fitted cork and with its bulb covered with a thin film of absorbent cotton (preferably the long-fibered variety sold for surgical dressings), is fitted into the flask with the thermometer bulb just below the lower level of the side neck opening. The flask is connected with the condenser tube.

6. Heat is applied cautiously and the gasoline brought to its boiling point. In case it is desired to record the initial boiling point the thermometer is read when the first drop  
23 falls from the end of the condenser tube into the graduate.

The amount of heat is then increased so that the distillation proceeds at a rate of from 4 c. c. to 5 c. c. per minute. The thermometer is read as each of the selected percentage marks is reached. In case maximum boiling point or dry point (one definition of end point) is to be measured, the heating is continued after the flask bottom has boiled dry until the column of mercury reaches a maximum and then starts to recede consistently.

7. Distillation loss is determined as follows: The condenser tube is allowed to drain for at least five minutes after heat is shut off, and a final reading taken of the quantity of distillate collected in the receiving graduate. The distillation flask is removed from the condenser and thoroughly cooled as soon as it can be handled. This can be accomplished by using first an air bath and then immersing the bulb of the flask in the ice-water mixture in the condenser trough. The condensed residue is poured into a small graduate or graduated test tube and its volume measured. This residue is of course retained for the acidity test which has been described in an earlier connection. The sum of its volume and the volume collected in the receiving graduate, subtracted from 100 c. c. gives the figure for distillation loss. In case this loss exceeds 2 per cent, a check distillation should be run to ascertain whether such loss is due to the presence of highly volatile constituents or to failure to condense the lighter fractions on account of too strong heating at the beginning of the distillation.

*Discussion of Details of Procedure.*

Some of the prescribed details of procedure merit discussion. The use of a boiling stone is desirable to prevent "bumping," which occasionally occurs, especially when the Engler flask is new or freshly cleaned.<sup>a</sup> The film of cotton on the thermometer bulb retains a layer of condensed gasoline and insures against superheating, either in the course of the distillation or at the end point. Superheating manifests itself as an irregular fluctuation of the thermometer during distillation, or as an abnormal rise at the end. The film of cotton should be very thin and in case of doubt the quantity used (5 to 10 milligrams) should be weighed. If the material used is the long-fibered cotton sold for surgical purposes, the film rarely needs renewing as, if properly applied, it adheres tenaciously to the thermometer bulb.

Avoidance of an excessive distillation loss is important, as otherwise the temperature readings will be abnormally high. If blends containing considerable proportions of casing-head gasoline are distilled, it may be necessary to use an ice-salt freezing mixture in the condenser trough and to keep the receiving graduate immersed in a mixture of ice and water (preferably not the ice-salt freezing mixture). If this is done the gasoline must be cooled in ice and water before measuring it into the flask, or else a suitable allowance (approximately 3 per cent) must be made for the contraction of the gasoline due to cooling it from room temperature to the freezing point of water.

**ADDITIONAL ANALYTICAL METHODS EMPLOYED  
IN THE TESTING OF GASOLINE.**

In addition to the tests described in connection with the suggested system of specifications there are various analytical methods employed, sometimes for more elaborate types of specifications and sometimes for the purpose of obtaining information of a general nature. Some of the more important of these tests are listed and described as follows:

*The "Doctor" Test.*

The "Doctor" test is largely employed by refineries for detecting the presence of certain types of decomposable sul-

---

(a) Engler flasks should be occasionally cleaned to remove deposits of carbon. This can be easily accomplished by filling the bulb with chromic-sulphuric acid cleaning mixture and allowing to stand over night.

phur compounds. It does not determine the actual presence or absence of sulphur in gasoline, and, in fact, products that have been refined to pass this test are likely to contain a larger percentage of sulphur than before treatment. But gasoline not passing the doctor test is likely to decompose in storage with the development of a yellow color and an offensive odor. In addition, there is a possibility that gasoline "sour" to the doctor test may have been the cause of certain reported corrosion of metal parts of carburetors.

The doctor test shall be conducted and interpreted as follows:<sup>a</sup>

Obtain pure flowers of sulphur and prepare the sodium plumbite or doctor solution. For the latter, dissolve approximately 125 grams of sodium hydroxide (NaOH) in a liter of distilled water, add 60 to 70 grams of litharge (PbO) and shake vigorously for 15 to 30 minutes, or let it stand with occasional shaking for a day. Allow it to settle and pour or siphon off the clear liquid. If the solution fails to settle properly it may be filtered through a mat of asbestos. The solution must be kept in a bottle closed tightly with a cork stopper.

In making the test shake together vigorously two volumes of gasoline and one volume of the doctor solution (10 c. c. and 5 c. c. are convenient quantities) in a test tube; or, if preferred, an oil sample bottle may be used with correspondingly larger quantities. After shaking together for about 15 seconds, add a small pinch of flowers of sulphur, shake the tube again for 15 seconds and allow the contents to settle. The quantity of sulphur used shall be such that practically all of it floats on the surface separating the gasoline from the doctor solution.

If the gasoline is discolored, or if the sulphur film is so dark that its yellow color is noticeably marked, the test shall be reported as positive and the gasoline condemned as "sour." If the liquid remains unchanged in color and if the sulphur film is bright yellow or only slightly discolored with gray or flecked with black, the test shall be reported negative and the gasoline considered "sweet."

#### *Corrosion and Gummying Test.*

A test involving evaporation of gasoline in a polished copper dish was advised by F. C. Robinson and his associates of the Atlantic Refining Co. for determining the purity of air-

---

(a) The bureau was aided in formulating a description of this test by C. J. Robinson, chemist of the Standard Oil Co. of New Jersey.

plane gasoline. The Bureau of Mines as yet lacks information on the desirability of applying this test generally to motor fuel, but is including a description of it for general information. The test seems to be a severe one, and failure to pass it may not mean that a gasoline is not satisfactory for ordinary uses.

A charge of gasoline is evaporated to dryness on a steam bath in a freshly polished hemispherical copper dish about 3½ inches in diameter. The dish is filled to within about three-fourths of an inch of the top, or a charge of 100 c. c. is measured in from a pipette.

The bottom of the dish must not be colored gray or black, as will be the case if elementary sulphur is contained in the gasoline. The presence of a peacock-colored deposit does not indicate sufficient sulphur to condemn the gasoline.

It is specified that a weighable residue shall not remain in the dish. Some preliminary experiments made by the bureau have indicated that the maximum allowable residue should be 0.03 per cent of the charge of gasoline evaporated.

#### *Unsaturation Test.*

Certain types of gasoline, particularly those derived from cracking processes, contain olefin and similar hydrocarbons. A simple test for determining the relative proportion of these constituents is furnished by the sulphuric acid absorption method. The bureau recommends the following procedure:<sup>a</sup>

The container recommended is that described in the catalogues of chemical supply houses as a 6-inch, 9-gram, 50 per cent Babcock cream bottle. The neck of such a bottle is calibrated for the volume of 4.5 grams of butter fat which is approximately 5 c. c. An ordinary 5 c. c. pipette can be regraduated to deliver this quantity. The gasoline to be tested is measured into a clean, dry Babcock bottle, cooled by immersion for a minute or two in ice water, after which 200 per cent by volume of ordinary concentrated sulphuric acid is poured in from a small graduate. Care should be taken that the acid runs quietly down the side of the bottle, instead of splashing onto the surface of the gasoline. A rubber stopper is then placed in the bottle and the contents are shaken, first slowly, then vigorously with a rotary motion for several min-

(a) Dean, E. W., and Hill, H. H., Determination of unsaturated hydrocarbons in gasoline: Tech. Paper 181, Bureau of Mines, 1917, 25 pp.

utes. The gasoline and the acid are separated by either of the following methods:

*Gravity Separation.*

Sulphuric acid is added to the contents of the bottle until the surface of the liquid is about level with the upper graduation mark on the neck of the bottle. The mixture is then set aside and allowed to stand overnight, until practically complete separation is effected.

*Centrifugal Separation.*

The stoppered bottle is placed in a suitable centrifuge and revolved for two or three minutes at a speed of 500 to 1,000 r. p. m. Sufficient acid is added to bring the level up to the lower graduation mark, and the bottle and its contents are again centrifuged to complete the separation. More acid is added to bring the column to the upper graduation mark, after which the residual volume of gasoline is read.

## VAPOR PRESSURE.

In order to insure safety in the shipment of gasoline by tank car a vapor pressure test is required. The limit usually prescribed is 10 pounds per square inch.

The standard method prescribed by the Bureau of Explosives<sup>b</sup> is briefly as follows:

*Apparatus.*

The apparatus consists of the well-known inspectors' gas gage (made by the Pittsburgh Gage & Supply Co., Pittsburgh, Pa.) and a metal test cylinder of about 450 c. c. capacity (approximately 9 inches long and  $2\frac{1}{8}$  inches in diameter, outside dimensions) with an opening at the top for a standard one-fourth inch taper screw fitting. Accessories are thermometers, water bath of any convenient sort, temperature regulating media, and a small measure, the capacity of which is exactly one-tenth the capacity of the test cylinder.

*Procedure.*

The test cylinder is filled to exactly 90 per cent of its capacity. This can be accomplished conveniently by filling to the top and then pouring out enough to fill the small measure

(b) Report of the Chief Inspector of the Bureau of the Safe Transportation of Explosives and Other Dangerous Articles, Feb., 1916, pp. 27-30.

mentioned in the preceding paragraph. The gage is screwed in tightly and the test cylinder immersed in water at a temperature of 21° C. (70° F.) and shaken gently for a few minutes until the gasoline has come to the temperature of the bath (five minutes is considered sufficient). Then the gage is unscrewed and the pressure released for a period of 20 seconds. The cylinder is closed again by screwing the gage in, using if necessary something like liquid shellac to make the joint tight.

The test cylinder is placed in a water bath at 38° C. (100° F.)—32° C. (90° F.) from November 1 to March 1—with the water level just below the lower edge of the pressure gage. The water is stirred continually and the temperature maintained constant for 10 minutes. The gage is then tapped lightly and the pressure read.

This test is one with which the Bureau of Mines has had little experience. It seems to be open to objection on the ground that the pressure developed may be affected by the degree of agitation to which the gasoline is subjected. The bureau is not, however, in a position to suggest modifications or improvements.

#### FORMS FOR RECORDING THE RESULTS OF GASOLINE ANALYSES.

In keeping laboratory records of gasoline analysis the bureau has had occasion to employ two forms which have proved particularly convenient and which are reproduced in the present paper for purposes of information. The forms are designed for recording more information than is needed for specification analyses and are the types the bureau has selected for its own use. Form 1 is a blank record for tabulating results of the physical examination and analysis of the gasoline. On Form 2 are shown typical distillation curves for straight refinery and blended casing-head gasolines, to which reference has already been made.

FORM 1.—Form for recording results of gasoline analysis.

U.S. BUREAU OF MINES  
**MOTOR FUEL DISTILLATION.**

FORM 2 (fig. 2).—Graphic chart for recording results of gasoline analysis.

Form 1 is generally made up as a  $3\frac{3}{4}$  by  $6\frac{3}{4}$  inch sheet, punched for inclosure in a standard size loose-leaf binder or notebook. Form 2 is used as a  $6\frac{3}{4}$  by 7 inch sheet, which when folded once can be carried in the same book. Form 2 is generally printed on semi-transparent paper so that copies of analytical results can be made by the process of blue printing.

*Centigrade-Fahrenheit Temperature Transformation Table.*

On account of the common use of the two temperature scales, centigrade and Fahrenheit, some simple means of translating figures recorded in these two systems is desirable. Table 1 following has been employed by the bureau and found particularly convenient.

Table 1.—*Degrees centigrade to degrees Fahrenheit.*

# 31 PUBLICATIONS OF PETROLEUM TECHNOLOGY.

A limited supply of the following publications of the Bureau of Mines has been printed and is available for free distribution until the edition is exhausted. Requests for all publications can not be granted, and to insure equitable distribution applicants are requested to limit their selection to publications that may be of especial interest to them. Requests for publications should be addressed to the Director Bureau of Mines.

The Bureau of Mines issues a list showing all its publications available for free distribution as well as those obtainable only from the Superintendent of Documents, Government Printing Office, on payment of the price of printing. Interested persons should apply to the Director, Bureau of Mines, for a copy of the latest list.

## *Publications Available for Free Distribution.*

Bulletin 120.—Extraction of gasoline from natural gas by absorption methods, by G. A. Burrell, P. M. Biddison, and G. G. Oberfell. 1917. 71 pp., 2 pls., 15 figs.

Bulletin 134.—The use of mud-laden fluid in oil and gas wells, by J. O. Lewis and W. F. McMurray. 1916. 86 pp., 3 pls., 18 figs.

Bulletin 148.—Methods for increasing the recovery from oil sands, by J. O. Lewis. 1917. 128 pp., 4 pls., 32 figs.

Bulletin 149.—Bibliography of petroleum and allied substances—1915, by E. H. Burroughs. 1917. 147 pp.

Bulletin 158.—Cost accounting for oil producers, by C. G. Smith. 1917. 123 pp.

Bulletin 162.—Removal of lighter hydrocarbons by J. M. Wadsworth. 1918. 164 pp., 50 pls., 45 figs.

Bulletin 163.—Methods of shutting off water in oil or gas wells, by F. B. Tough. 1918. 122 pp., 20 pls., 7 figs.

Bulletin 170.—Extinguishing and preventing oil and gas fires, by C. P. Bowie. 1918. 50 pp., 19 pls., 4 figs.

Technical Paper 32.—The cementing process of excluding water from oil wells, as practiced in California, by Ralph Arnold and V. R. Garfias. 1913. 12 pp., 1 fig.

Technical Paper 38.—Wastes in the production and utilization of natural gas, and methods for their prevention, by Ralph Arnold and F. G. Clapp. 1913. 29 pp.

Technical Paper 42.—The prevention of waste of oil and gas from flowing wells in California, with a discussion of

special methods used by J. A. Pollard, by Ralph Arnold and V. R. Garfias. 1913. 15 pp., 2 pls., 4 figs.

Technical Paper 45.—Waste of oil and gas in the Mid-Continent fields, by R. S. Blatchley. 1914. 54 pp., 2 pls., 15 figs.

Technical Paper 49.—The flash point of oils, methods  
32 and apparatus for its determination, by I. C. Allen and A. S. Crossfield. 1913. 31 pp., 2 figs.

Technical Paper 66. Mud-laden fluid applied to well drilling, by J. A. Pollard and A. G. Heggem. 1914. 21 pp. 12 figs.

Technical Paper 68.—Drilling wells in Oklahoma by the mud-laden fluid method, by A. G. Heggem and J. A. Pollard. 1914. 27 pp., 5 figs.

Technical Paper 72.—Problems of the petroleum industry, results of conferences at Pittsburgh, Pa., August 1 and September 10, 1913, by I. A. Allen. 1914. 20 pp.

Technical Paper 79.—Electric lights for oil and gas wells, by H. H. Clark. 1914. 8 pp.

Technical Paper 87.—Methods of testing natural gas for gasoline content, by G. A. Burrell and G. W. Jones. 1916. 26 pp., 7 figs.

Technical Paper 117.—Quantity of gasoline necessary to produce explosive vapors in sewers, by G. A. Burrell and H. T. Boyd. 1916. 18 pp., 4 figs.

Technical Paper 120.—A bibliography of the chemistry of gas manufacture, by W. F. Rittman and M. C. Whittake, compiled and arranged by M. S. Howard. 1915. 30 pp.

Technical Paper 127.—Hazards in handling gasoline, by G. A. Burrell. 1915. 12 pp.

Technical Paper 131.—The compressibility of natural gas at high pressures, by G. A. Burrell and I. W. Robertson. 1916. 11 pp., 2 figs.

Technical Paper 158.—Compressibility of natural gas and its constituents, with analyses of natural gas from 31 cities in the United States, by G. A. Burrell and I. W. Robertson. 1917. 16 pp., 9 figs.

Technical Paper 161.—Construction and operation of a single-tube cracking furnace for making gasoline, by C. P. Bowie. 1916. 16 pp., 10 pls.

Technical Paper 163.—Physical and chemical properties of gasoline sold throughout the United States during the calendar year 1915, by W. F. Rittman, W. A. Jacobs, and E. W. Dean. 1916. 45 pp., 4 figs.

Technical Paper 181.—Determination of unsaturated hydrocarbons in gasoline, by E. W. Dean and H. H. Hill. 1917. 25 pp.

Technical Paper 185.—Use of the interferometer in gas

analysis, by F. M. Seibert and W. C. Harpster. 1918. 18 pp., 1 pl., 5 figs.

*Publications That May Be Obtained Only Through the Superintendent of Documents.*

Bulletin 19.—Physical and chemical properties of the petroleum of the San Joaquin Valley, Cal., by I. C. Allen and W. A. Jacobs, with a chapter on analyses of natural gas from the southern California oil fields, by G. A. Burrell. 1911. 60 pp., 2 pls., 10 figs. 10 cents.

Bulletin 32.—Commercial deductions from comparisons of gasoline and alcohol tests on internal-combustion engines, by R. M. Strong. 1911. 38 pp. 5 cents.

Bulletin 43.—Comparative fuel values of gasoline and denatured alcohol in internal-combustion engines, by R. M. Strong and Lauson Stone. 1912. 243 pp., 3 pls., 32 figs. 20 cents.

Bulletin 65.—Oil and gas wells through workable coal beds; papers and discussions, by C. S. Rice, O. P. Hood, and others. 1913. 101 pp., 1 pl., 11 figs. 10 cents.

Bulletin 88.—The condensation of gasoline from natural gas, by G. A. Burrell, F. M. Seibert, and G. G. Oberfell. 1915. 106 pp., 6 pls., 18 figs. 15 cents.

Bulletin 114.—Manufacture of gasoline and benzene-  
33 toluene from petroleum and other hydrocarbons, by W. F. Rittman, C. B. Dutton, and E. W. Dean, with a bibliography compiled by M. S. Howard. 1915. 258 pp., 9 pls., 45 figs. 35 cents.

Bulletin 125.—The analytical distillation of petroleum, by W. F. Rittman and E. W. Dean. 1916. 79 pp., 1 pl., 16 figs. 15 cents.

Technical Paper 3.—Specifications for the purchase of fuel oil for the Government, with directions for sampling oil and natural gas, by I. C. Allen. 1911. 13 pp. 5 cents.

Technical Paper 10.—Liquified products of natural gas, their properties and uses, by I. C. Allen and G. A. Burrell. 1912. 23 pp., 5 cents.

Technical Paper 25.—Methods for the determination of water in petroleum and its products, by I. C. Allen and W. A. Jacobs. 1912. 13 pp., 2 figs. 5 cents.

Technical Paper 26.—Methods for the determination of the sulphur content of fuels, especially petroleum products, by I. C. Allen and I. W. Robertson. 1912. 13 pp., 1 fig. 5 cents.

Technical Paper 36.—The preparation of specifications for petroleum products, by I. C. Allen. 1913. 12 pp., 5 cents.

Technical Paper 37.—Heavy oil as fuel for internal-combustion engines, by I. C. Allen. 1913. 36 pp. 5 cents.

Technical Paper 51.—Possible causes of the decline of oil wells, and suggested methods of prolonging yield, by L. G. Huntley. 1913. 32 pp., 9 figs. 5 cents.

Endorsed: Filed Jan. 10, 1921, W. V. McClure, Clerk U. S. District Court, Eastern District of Oklahoma.

---

And on the same day, to-wit, the 10th day of January A. D. 1921, the defendant filed petition for writ of error, together with its assignment of errors, which petition was allowed by the court. Said petition for writ of error, assignment of errors and order allowing writ of error are in words and figures as follows:

In the United States District Court of the Eastern District of Oklahoma. United States of America, Plaintiff, vs. Gulf Refining Company, a Corporation, Defendant.—No. 3716 Criminal.

**Petition for Writ of Error.**

To the Honorable Robert L. Williams, Judge of the United States District Court for the Eastern District of Oklahoma:

Now comes the Gulf Refining Company, a corporation, defendant in the above and foregoing cause, and conceiving itself aggrieved by the final order, decree, judgment and sentence entered in the above entitled cause on the 10th day of January, 1921, in favor of the United States and against this defendant, shows unto this Honorable Court that in the record, proceedings and rendition of such final order, decree, judgment and sentence entered as aforesaid, manifest error herein occurred greatly to its damage, and by which it feels itself aggrieved, all of which more fully and particularly appears in and from the Assignments of Error which is filed with this petition.

Wherefore, said Gulf Refining Company prays that a Writ of Error be issued in said cause to the United States Circuit Court of Appeals of the Eighth Circuit, for the correction of said errors, and the reversal of said cause, directing the Clerk of this Court to transmit to the Clerk of the United States Circuit Court of Appeals of the Eighth Circuit, at St. Louis, Missouri, for filing in said court a true and correct copy and transcript of the record in said cause within sixty days from date hereof, to-wit, on or before the 11th day of March, 1921, in order that said manifest error may be corrected and justice done, and that a citation be issued to the United States of America requiring the United States to be and appear in said Circuit Court of Appeals of the Eighth Circuit, at St. Louis, Missouri, within sixty (60) days from the date of said citation, to show cause, if any it have, why said manifest error should not be corrected and justice done.

The said Gulf Refining Company, having filed herein its assignments of error, also prays that in addition to issuance of said Writ of Error, that an order be made superseding the final order, judgment, decree and sentence entered in said cause, and an order be made and entered fixing the amount of security which said defendant will be required to give and furnish to supersede said judgment and the cost of said Writ of Error, and that defendant be allowed ten (10) days from this date in which to furnish said security, and that said final order, judgment, decree and sentence in said cause be superseded for and during the ten (10) days allowed for the furnishing of said security, and that on the furnishing of said security and the approval thereof, that said judgment, final order, decree and sentence be superseded and stayed until the final disposition of the said Writ of Error and the proceedings had thereon. And said defendant herewith submits its Assignments of Error.

R. L. BATTS,

JNO. E. GREEN, JR.,

JAMES B. DIGGS,

FRANK M. SWACKER,

*Attorneys for Gulf Refining Company.*

Endorsed: Filed in open court Jan. 10, 1921, W. V. McClure, Clerk U. S. District Court.

---

In the District Court of the United States, for the Eastern District of Oklahoma. United States of America, Plaintiff, against Gulf Refining Company, Defendant.—No. 3716. Criminal.

**Assignments of Error and Prayer for Reversal.**

Filed January 10, 1921.

The defendant, Gulf Refining Company, assigns as error prejudicial to it in the record, proceedings, judgment and sentence of the court, in the above-entitled cause, that the court erred:

1. In sustaining the plaintiff's demurrer to defendant's plea in abatement as to each count of the alleged indictment herein, because the same was not a true bill found according to law by the grand jury.

II. In denying defendant's motion to strike the alleged indictment herein from the files of the court as not being a true bill found according to law by the grand jury.

III. In overruling and denying defendant's motion to take proof on its motion to strike said alleged indictment from the files as not being a true bill found according to law by the grand jury.

IV. In overruling and not sustaining defendant's special demurrer, to the counts numbered 36 to 40, inclusive, and 81 to 85, inclusive, of the said indictment, because the said counts are double, in that each of said counts attempts to charge two separate and distinct offenses, that is, (a) the offense of accepting a concession whereby property should be transported at less than the lawful rates, and (b) accepting a concession whereby a discrimination would be procured.

V. In overruling and not sustaining defendant's demurrer to each count of the indictment, which demurrer should have been sustained upon each of the following grounds, to-wit:

(a) Because the matters and things set forth and charged do not constitute an offense against the laws of the United States.

(b) Because the averments of each count of said indictment are too general, vague, indefinite and uncertain to inform the defendant of the nature and cause of the accusation against it, or apprise it with such reasonable certainty of the offense with which it is charged or what it may expect to meet on the trial, so as to enable it to make its defense.

(c) Because the averments of each count of said indictment are so vague, indefinite and uncertain, consisting in the pleader's conclusion, as to what constitutes a concession, that the court is unable to say as a matter of law whether the acts of defendant constitute an offense against the United States.

VI. In denying defendant's motion to instruct a verdict for the defendant, based on the admissions of the Government in its opening statement to the jury that it proposed to prove that defendant had shipped casinghead gasoline and casing-

head gasoline blended with naphtha, whereas the indictment charges the defendant with having shipped gasoline, for the following reasons:

(a) Because it was apparent that the proof would be at variance with the charge in the indictment.

(b) Because it is a scientific fact, of which the court has judicial knowledge, that casinghead gasoline is not the same commodity as, but different from, gasoline.

(c) Because the admission that the commodity actually shipped was casinghead gasoline and not gasoline disclosed that the controversy involved the construction and determination of whether the tariff naming rates on gasoline embraced and applied to casinghead gasoline, or whether the tariff on unrefined naphtha embraced and applied to casinghead gasoline, of which character of controversy the court had no jurisdiction, such jurisdiction being vested solely in the Interstate Commerce Commission.

---

And in admitting evidence at the trial offered by the United States and overruling the defendant's objections thereto, to which rulings the defendant then and there duly excepted, in each of the following instances, to-wit:

VII. In permitting Exhibit No. 1 to be read in evidence, said exhibit being set forth in full in defendant's bill of exceptions and in substance showing that all the stock, excepting shares held by directors, of the Gulf Refining Company, Gypsy Oil Company and Gulf Pipe Line Company, was owned and controlled by the Gulf Oil Corporation.

VIII. In admitting the testimony of the witness Riedeman in substance that prior to December 2, 1916—the date upon which the tariff publishing rates on unrefined naphtha became effective, and that description was adopted by the Gypsy Oil Company—the Gypsy Oil Company had been accustomed to describe its shipments from Kiefer, Oklahoma, to Port Arthur, Texas, as gasoline, such evidence having been admitted by the court upon the theory of establishing a course of conduct, whereas there was no showing of a similarity in material respects of the surrounding circumstances, the evi-

dence on the contrary showing dissimilarity in the vitally material respect that there was no tariff publishing rates on unrefined naphtha previous to said date.

Said testimony being as follows:

"By the Court: As shown in Exhibit 2 of this identical commodity according to his best recollection were made, were billed out as gasoline. You have got that in so I will not permit you to put these in the record, I will not permit them to be introduced, in the record, he has already testified.

"By Mr. Swacker: We interpose an objection to the testimony on the ground of irrelevancy.

"By the Court: Very well I will permit that, these prior shipments made under the direction of the same superintendent, Mr. Mallard?

"A. Yes, sir.

"By the Court: I will permit that to show the conduct of their business.

"By Mr. Swacker: If your honor understands the basis of our objection we don't deny—

"By the Court: That comes afterwards as a matter of explanation.

"By Mr. Swacker: But we deny the relevancy. This is attempting to show a rule or course of conduct in respect to other things than those alleged in the indictment and we say any explanation of such course of conduct must be negatived at this time and for that reason it is incompetent, irrelevant and immaterial.

"By the Court: I will permit it for this reason. The Government says this was gasoline and not unrefined naphtha. That is their contention now the shipments from the same points by the same concern that conducted the business that is the circumstance for the jury to consider in weighing the evidence. This was prior to a certain date that they shipped it as gasoline. Now they may of course, I am assuming the explanation that will be admitted on the part of the name used by the defense they could have called it either name and for certain reason and for their convenience they used either name. I will instruct the jury not to make up your minds on any part of the evidence; that when you hear the evidence in this case you always keep your minds open remembering

all of the evidence as near as you can and keep your minds open and hear the last part of the evidence and then keep your mind open and not make up your mind until you have heard the argument and the instructions of the court.

"By Mr. Diggs: We want to get in an exception. We object to the introduction of the evidence as incompetent, irrelevant and immaterial.

"By Mr. Payne: What evidence.

"By Mr. Diggs: The answer of the witness the court permitted him to answer. And for the further reason the Government states that it is for the purpose of proving a course of conduct and the fact surrounding the different shipments not being shown to be identical and similar in the material respects of the rate and for the further reason that at the time the ten papers in Exhibit 2 mentioned the only rate in existence by which it could be shipped was the classification of gasoline as shown by the tariff.

"By the Court: Now on these shipments that are referred to originated at the same point Kiefer and brought the same rate to Port Arthur.

"A. Yes, sir.

"By the Court: And was the same material—same commodity according to your best recollection?

"Yes, sir.

"By the Court: And shipped for the same purpose.

"Yes, sir.

"By the Court: Very well you may have your exception." (S. M., pp. 46-48.)

IX. In admitting the evidence while the witness Sweet was on the stand in substance to the effect that the material shipped northbound from Port Arthur to Kiefer by the Gulf Refining Company before December 2, 1916, was described by it as naphtha, whereas thereafter it was described by it as crude unfinished naphtha; December 2, 1916, being the date upon which the tariff publishing rates on crude unfinished naphtha became effective; said evidence having been admitted by the court for the purpose of showing the conduct of defendant's business, whereas there was no showing of similarity of surrounding circumstances, but, on the contrary, the evidence showed such

circumstances to be different in a vitally material respect in that previous to said date there were no tariffs published naming rates on crude unfinished naphtha.

Said testimony being as follows:

"The Court: I understand prior to December 2, 1916, that the government offers to prove——

"Mr. Chambers: That the northbound shipments——

"The Court: That this commodity which was shipped from Port Arthur to Kiefer for the purpose of being blended with the casinghead gas was billed as naphtha.

"Mr. Swacker: Yes, sir.

"The Court: And that after December 2nd it was billed as crude naphtha?

"Mr. Swacker: Crude unfinished naphtha. We don't want this statement in the record that we put it in.

"The Court: No, I said the government, and the defendants save an exception to its relevancy or materiality in order to shorten the record, admit the fact.

"By Mr. Swacker: We want the basis of our objection——

"By the Court: And the court admits this for the purpose for showing the conduct of the business and during that period and grant an exception to the defendant.

"By Mr. Swacker: And we want to go further and state the basis of our objection. We assume this evidence to be offered as stated by the court indicating the course of conduct and we say it would be admissible only if it were shown that all the surrounding circumstances were identical, especially the material circumstances that under the evidence as stated there was a change in the rate which was the most material circumstance, and no offer has been made to prove that the circumstances were identical or such a basis as would admit this evidence and wherefore we say it is incompetent, irrelevant and immaterial.

"By the Court: For the present it is admitted and your exceptions saved." (S. M., pp. 73, 74.)

X. In admitting the testimony of the witness Sweet as follows:

"Q. You never called the blended stuff you shipped from Kiefer, unrefined naphtha until after the 2nd of December, 1916, did you? A. No, sir.

"Mr. Swacker: We object to that on the same ground as the previous question.

"By the Court: Very well.

"By Mr. Swacker: Give us an exception.

\* \* \* \* \*

"Q. You never heard the product that is produced from the compression plant called unrefined naphtha until after the 2nd of December, 1916, and you know that prior to that time it was always called casinghead gasoline and is yet?

"By Mr. Diggs: To which we object, incompetent, irrelevant and immaterial and the witness not being shown to have a knowledge, assumed to him that it was called this prior to December 2, 1916.

"By the Court: Objection overruled. You may have an exception.

"Mr. Diggs: To the last part of the question we object as calling, or assuming that the witness knows a state of facts that is not shown in evidence that he does know. The first part we have no objection.

"The Court: I will let him answer.

"Mr. Green: We object to the method. It is not shown that the witness is entirely unwilling to answer.

"The Court: I will permit it.

"Mr. Green: And I think it is argumentative—

"The Court: Answer the question.

"A. After that date it was known as unrefined naphtha and prior to that date, commonly known as gasoline." (S. M., pp. 77-80.)

XI. In admitting the testimony of the witness Sweet as follows:

"Q. Now after the 2nd of December, 1916, you say you shipped this commodity at Kiefer that was blended as unrefined naphtha to Port Arthur? A. Yes, sir.

"Q. At that same time you shipped this same commodity that was blended to a Shady Side, Pennsylvania, as gasoline, didn't you?

"By Mr. Swacker: Object to both the form of the question as a deliberate attempt to get out a fact which we insist is irrelevant and to the answer on the same ground that it is utterly irrelevant, the circumstance not being shown as to what the rates and regulations provided to Shady Side.

"By Mr. Diggs: Further that it is an assumption that the Gypsy has shipped and that this witness knows.

"By the Court: I will permit the form of the question. I have heard the evidence of this witness but I want to see. You say at the same time while you were shipping this product from Kiefer to Port Arthur as unrefined naphtha you were shipping it to the Shady Side plant at Pittsburgh? Now who owns the plant at or near Pittsburgh?

"A. Gulf Refining Company.

"The Court: And what was it shipped there for, what purpose was it shipped to Shady Point?

"A. I am not in a position to say. It was shipped there, that is a distributing point I believe, I have never been there, I don't know what it is.

"The Court: I will permit the question to be asked.

"Mr. Diggs: We save an exception.

"The Court: Very well.

"Q. Answer the question. Do you remember the question?

"A. That is with reference to shipping to Pittsburgh?

"Q. Yes. A. Yes, sir.

"Q. And you shipped it as gasoline?

"A. Yes, sir, and we shipped it—

"Mr. Chambers: Now I never asked you that.

"The Court: If he wants to volunteer that, that is a matter for the jury to determine. Go ahead if you want to volunteer an explanation, the court will permit you to do that.

"A. We shipped this product to Port Arthur as unrefined naphtha because the tariff gave us a rate to Port Arthur. They didn't give us a rate to Pittsburgh and consequently we shipped it to Pittsburgh as gasoline.

"Q. In other words, until the unrefined naphtha rate from your standpoint is put into effect, the designated term for shipping purposes of this commodity is gasoline. that is right? A. The only term we had for it.

"Q. Only term you had for it and shipped it as gasoline for that reason? A. Yes, sir.

"Mr. Swacker: Now we would like to renew our objection to this line of questions and ask that it be stricken out obviously as immaterial and wholly irrelevant, it being apparent the conditions were not the same.

"The Court: That is a question of fact for the jury to determine. They are the facts and the jury looks into them and sees. I think it is all right to make this explanation to show he is an employee of the oil company. The jury weighs that and weighs the reasons, if there are any reasons, and they weigh it. That is the issue in this case, the way I understand it, if it is properly termed under this tariff 'Unrefined Naphtha'. I will permit all this evidence to go to the jury for them to weigh it.

"Mr. Swacker: We want an exception.

"The Court: Very well." (S. M., pp. 91-93.)

XII. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 5, 6, 7, 8 and 9, consisting in shipping orders of the Gypsy Oil Company covering shipments from Kiefer to Port Arthur made previous to December 2, 1916, in which the commodity was described as gasoline, and the testimony of the witness Manson in relation thereto.

Said testimony being as follows:

"Q. I am handing you papers identified by the stenographer as Exhibits 5, 6, 7, 8 and 9 and ask you what they are and if you signed them? A. Yes, sir, I did.

"Q. What is the date of Exhibit No. 5?

"A. November 2nd.

"Q. And what is the date of Exhibit No. 6?

"A. November 4th.

"Q. And what is the date of Exhibit No. 7?

"A. November 7th.

"Q. And Exhibit 8?

"A. November 11th, I didn't sign that one marked Exhibit 8.

"Q. What are those papers, the general term?

"A. They are bills of lading.

"Q. They are bills of lading? A. Yes, sir.

"By the Court: Who signed Exhibit No. 8, if you know?

"A. Mr. Millard.

"By the Court: Who?

"A. He was Superintendent, Assistant Superintendent.

"Q. Do you know his handwriting?

"A. Yes, sir, I believe that is it.

"Mr. Chambers: We will offer these in evidence, if the court please.

"The Court: Show them to the other side.

"Q. What was the year? A. I believe it was 1916.

"Mr. Swacker: We desire to object to these as being incompetent, irrelevant and immaterial, they being matters not properly proven as under similar circumstances and conditions, but on the contrary the evidence already in the case showing a different set of circumstances and conditions surrounding it.

"The Court: What is that they are offering?

"Mr. Swacker: They are shipments before December 2, 1916.

"Mr. Chambers: And shipped as gasoline.

"The Court: I will admit them.

"Mr. Swacker: Exception, please.

"Mr. Chambers: May I ask the court, will it be proper instead of reading these—

"The Court: They may be considered read and you may call attention to them later.

"Mr. Chambers: Then they can be considered as read?

"The Court: They may be considered as read. They are only admitted for the purpose of showing the conduct of the business.

"Mr. Chambers: That is all.

"The Court: And the evidence is already in and the only reason I admit them now is because there was an objection to them and then I am going to instruct the jury they are not to give undue importance to this evidence; that is the reason I excluded them you know.

"Mr. Chambers: Of course we have no other evidence in connection with that.

"The Court: The defense by their objection brought the admission of the papers themselves on themselves." (S. M., pp. 160-162.)

XIII. In admitting in evidence and permitting to be read to the jury that portion of Exhibit Number 2, consisting in shipping orders of the Gypsy Oil Company dated prior to December 2, 1916, describing shipments of gasoline, and the testimony of the witness Riedeman relating thereto.

Said testimony being as follows:

"Q. Your name is Riedeman? A. Yes, sir.

"Q. I am handing you a bunch of what purports to be shipping orders and embracing ten shipping orders, marked yesterday as Exhibit 2, and I will ask you to state if those shipping orders were made out by you while you were in the employ of the Gypsy Oil Company?

"A. They were.

"Q. And those shipments made from—well, I don't know, where were they made from?

"A. I will have to look at those.

"Q. I don't know where to look.

"A. From Kiefer to Port Arthur.

"The Court: Where were the other shipments, that other batch from?

"Mr. Chambers: Kiefer, Oklahoma, it states there.

"The Court: Where to?

"Mr. Chambers: Kiefer, Oklahoma, to Port Arthur. Now we will offer these in evidence.

"Mr. Swacker: We desire to make the same objection to these as being matters *res inter alia*, and no proper foundation laid for the introduction, the circumstances already in evidence showing that the rates were different at the time these shipments were made, all being before December 2, 1916.

"The Court: I will permit them to be introduced.

"Mr. Swacker: We except.

"The Court: To show the conditions, and I will instruct the jury later on, and they may be marked and considered as read. Of course when the question arises and where all the evidence is in, if there is a theory reasonable and in accordance with all the evidence the contention of the defendant as to the change, then that will destroy any evidential presumption that may be raised in favor of the government. I will cover that in instructions later on.

"Mr. Swacker: I except.

"Mr. Swacker: We may have an exception.

"The Court: Very well." (S. M., pp. 162, 163.)

XIV. In admitting the testimony of the witness Waddell, the agent of the Kansas City Southern Railroad, in substance that he collected the rate applicable to gasoline upon the shipments, moving previous to December 2, 1916, covered by the shipping orders embraced within Exhibit 2.

Said testimony being as follows:

"Referring to Government's Exhibit No. 2, covering shipments from Kiefer, Oklahoma, in November, 1916, and by the Gypsy Oil Company, gasoline department, and consigned to the Gulf Refining Company at Port Arthur, and billed as gasoline, can you state what rate was collected on those shipments?"

"The Court: What basis of rate?"

"Q. What basis of rate?"

"Mr. Swacker: As he puts the question, he can or will he?"

"The Court: He is asking if he can state——"

"Mr. Swacker: We object to the question as being irrelevant, incompetent and immaterial.

"Q. Mr. Waddell, as a general railroad practice——"

"The Court: No, he has not answered the question yet.

"A. The freight charges were collected on the rate, gasoline rate.

"The Court: On the rates prescribed for gasoline?"

"A. Yes, sir.

"The Court: The commodity shipped as gasoline?"

"A. Yes, sir." (S. M., p. 213.)

XV. In permitting the Government's counsel to read from a book described by him as Exhibit 21, not in evidence, respecting which the witness Timmons testified as follows:

"By Mr. Payne: Mark this Government's Exhibit 21.

"Q. I show you exhibit 21 for identification and call your attention to the second and third and fourth and fifth and sixth entries which show gasoline——"

"By Mr. Swacker: I object to his question.

"By the Court: Let him get the question in and don't answer until I pass on it.

"Q. As to Tanks 511, 512, 805, 357 and 922 I will ask you to state to the court if you know how the inspectors, how the inspectors inspected the contents of those tanks to determine the fluid in those tanks was gasoline?

"By Mr. Swacker: I object to the witness testifying about the papers, it is now shown he ever saw it or knows anything about it or he made the entries or he had anything to do with it and he testifies the inspector was not under his direction.

"By the Court: The question is if you know how they determine that. That is merely for the purpose of identification of a fact, directing the attention of the witness to it. If you know how the inspector determines, by what process to determine whether that was gasoline, if you know that you may answer that.

"A. This report is not complete.

"The Court: Now you answer the question, do you know how they determined that?

"A. I know how they determine it.

"The Court: Very well.

"Q. State that?

"The Court: What is that now?

"Q. He says he knows how they determine it, state it then.

"A. Well, they take gravity, color and distillation.

"Q. Is it not a fact that if the gravity is fifty-seven or above, you designate it as gasoline, and that if it is fifty-six or some few points below, fifty-six or fifty-five, the inspectors designate it as naphtha; if it is between fifty-five and fifty-seven they come to you for instructions as to whether they will designate it as gasoline or as naphtha?

"A. They don't come to me for instructions at all. I stated before that was not left to me at all.

"The Court: Now, you have answered the first part. You ought not to put so many questions in one. Now you asked him three questions in one, and he answered the last.

"Mr. Payne: Thank you for the suggestion.

"Q. If the gravity—is it not a fact that if the grav-

ity is fifty-seven or higher, it is the general custom and course of business to designate the fluid in that tank as gasoline?

"A. Might be with them, but it ain't with me.

"The Court: What was it the custom in that laboratory?

"A. The custom shows here that is what they called it.

"Q. That is, they called it gasoline if the gravity was fifty-seven or higher? A. Yes.

"Q. Suppose that the gravity was fifty-five, what was it the custom to designate it on those sheets?

"A. Well, it shows here——

"The Court: Well, never mind what is on that sheet. I don't permit what is on that sheet. What did they do, what did the experts in the laboratory whose duty it was to examine the samples, now what did they do, how did they designate it?

"Mr. Swacker: I object to that, it is not shown that these are experts, they are boys and under somebody else's instructions; and he is stating what he assumes to be the custom of those boys in making these tests.

"The Court: Well, he testified they worked in the laboratory; you would naturally assume that they were experts. What experience did those people that make the tests have?

"A. Weighing up the oil and running distillations and taking color.

"The Court: Well, did that experience qualify them to do that kind of work?

"A. Yes, sir.

"The Court: The qualification that is required in the usual oil laboratory for such people. Now I will give you all a chance to cross examine as to qualification if you want to.

"Mr. Swacker: At this time?

"The Court: Yes, I will permit you just like on voir dire to ask questions, and I will pass on whether they are qualified to do that.

*Examination by Mr. Swacker.*

"Q. What is the age of these inspectors you speak of?

"A. They run from eighteen, twenty-five, twenty-six and twenty-seven years old.

"Q. Are they what you might consider as student chemist? A. No, sir, not in that department.

"Q. Are they chemists at all? A. No, sir.

"Q. They merely perform the distillation tests which is a mechanical process? A. Yes, sir.

"Q. And put down the instances shown by the distillation test? A. Yes, sir.

"Q. They have nothing to do with the classification of the material they test? A. No, sir.

"Q. Whatever name they may use or enter is such as they themselves may adopt without any effort of accuracy as a matter of classification, not such as they may be instructed to? A. Yes, sir.

"Q. Is that right? A. Yes, sir.

"By Mr. Swacker: I don't think the entries are admissible—

"By the Court: These boys as you call them that work there in making these tests to determine the color and the gravity, they determine the gravity and the color and what else do they determine?

"A. They determine the distillation—

"By the Court: The distillation, the color and the gravity, now how would they determine it?

"A. By weight of the oil.

"By the Court: They determine the distillation by the weight?

"A. Run through an Engler flask.

"By the Court: Run it through an Engler flask and that would show the distillation would it?

"A. Yes, sir.

"By the Court: And then they took the color by what means, by what means did they take the color?

"A. Through a machine, two tubes to it, one is empty and the other is filled up with this oil, there is a middle faucet on that and a microscope on the top and by looking through they match these two colors. When both discs match, that was your color.

"By the Court: Now there is a distillation, the process of determining distillation and the process of determining the color, now the next is determining the specific gravity, how did they do that?

"A. That is by hydrometers and a thermometer.

"By the Court: Now their experience in making these tests under the processes outlined by you?

"A. Yes, sir, they could do that if they had enough experience they could.

"By the Court: Well were they tested before they were put in there to do that kind of work?

"A. They were broke into it, they gradually worked up to it.

"By the Court: Now you say they were fitted to determine the distillation and the specific gravity and the coloring. Now how would they determine what it was, where did they get that?

"A. That might have been their own conception of it.

"By the Court: Now were they instructed as to that by their superior officers who were expert chemists?

"A. I cannot say I don't know about that.

"By Mr. Swacker: May I ask another question?

"By the Court: Yes.

*Examination by Mr. Swacker.*

"Q. They had nothing to do with the classifying of this material? A. No, sir.

"Q. That was no part of their work? A. No, sir.

"Q. All they were there for to determine or ascertain what the distillation was, what the gravity was and what the color was and record that? A. Yes, sir.

"Q. And that was the classification so far as any classification was made? A. Yes, sir.

"Q. There was no classification by name? A. No, sir.

"By the Court: How it is competent, after the processes of making these records, I hold the evidence shows they were expert enough to determine the specifications, gravity and the distillation and as to the coloring by these processes. I will let that much go to the jury. Now then you can introduce as to the name of it, you will either have to show that was done by an expert or they were instructed by an expert as to the names to meet the tests to determine by it.

"By Mr. Swacker: Then will the court ask the jury to disregard those entries.

"By the Court: These entries have not been introduced, the jury don't consider anything except what is admitted in evidence before them. That is merely a predicate thus far and not admitted to the jury and merely shown to the witness for directing his attention to a question." (S. M., pp. 234-240.)

XVI. In admitting in evidence and permitting to be read to the jury Exhibits 21 and 22, and admitting the testimony of the witness Anderson in respect to the practice of the Totem Gasoline Company; for the reasons that the practice of the Totem Gasoline Company was in no way binding upon this defendant, that it was not shown that the material circumstances surrounding the business of the Totem Gasoline Company were identical or similar to those surrounding shipments to defendant, that the manner in which the Totem Gasoline Company described its products for shipment was not competent to prove what was the proper name of the commodity shipped by the Gypsy Oil Company, and that it was not competent to prove a general custom by showing individual instances; said testimony being as follows:

"Q. State your position with the Totem Gasoline Company?

"A. I am general superintendent over the four plants.

"Q. Where are the four plants located?

"A. The Totem is at Jenks, the Kadeshan and Shade at Stone Bluff, and Kadeshan is at Broken Arrow.

"Q. Now referring to the plant at Jenks, state what kind of a plant it is and what you produce.

"Mr. Diggs: To which we object as being incompetent, irrelevant and immaterial. The Gulf Refining Company—

"The Court: What is the purpose of this offer?

"Mr. Payne: Your honor, certain counts allege discrimination against the Totem Gasoline Company in that—I will state it if you want me to.

"The Court: Yes.

"Mr. Payne: In that they shipped casinghead gasoline and billed it on the railroad as casinghead gasoline or gasoline, and they paid the gasoline rate, and we will show that their product is precisely the same product.

"The Court: Very well, get your objection.

"Mr. Diggs: We object as being incompetent, irrelevant and immaterial, not within the issues of this case, and not being shown that the Gulf Refining Company is connected with or interested in any of the plants with which the witness has said that he is connected, and that their practice and method of

shipment would be hearsay as far as the defendant in this case is concerned.

"The Court: I will allow your exception.

"Mr. Diggs: Exception.

"Q. What kind of a plant is it, Mr. Anderson?

"A. It is a compression,—

"Q. Compression what? A. Gasoline plant.

"Q. Compression gasoline plant? A. Yes, sir.

"The Court: You want to confine this to the period named in the indictment.

"Q. During the period from January 1, 1918, to June 1, 1918, did the Totem Gasoline Company of Jenks produce casinghead gasoline?

"Mr. Diggs: To which we object as being irrelevant, incompetent and immaterial, and not within any of the issues raised in this case, and the defendant is not shown to be connected with any such plant.

"The Court: The objection is overruled.

"Mr. Diggs: The defendant excepts.

"A. (No response.)

"Q. State briefly the process by which you produce casinghead gasoline, very briefly?

"Mr. Diggs: We object—hold on.

"The Court: Have your objection on the same ground, the objection is overruled and exception noted.

"Mr. Diggs: In order to preserve the record, and under some of the rulings we have to state what our objections are. To state we have them on the same ground does not amount to anything.

"The Court: On the same ground as stated above, just say the same objection made on the same ground as above, and the same ruling and exceptions allowed.

"Q. I asked you how you produced—

"By Mr. Diggs: The defendant in this case states his objection in that manner owing to the direction of the court.

"By the Court: That will be allowed as if set out word for word as above. Go ahead, let's get through.

"Q. Answer the question, Mr. Anderson?

"A Produce the gasoline by the regular system of compression plants.

"Q. That is go ahead, tell how you get the gas out of the well and what is done with it?

"A. It is pumped to the plant by vacuum pumps.

"By Mr. Diggs: To which we object on the same grounds state- above.

"By the Court: Same grounds set out specifically as above and the objection is overruled and exception save-.

"Q. Go ahead Mr. Anderson.

"A. And is discharged from the vacuum pump to the compressors which run from a low stage to 40 or 50 pound pressure, whatever your load is and then goes to the high stage which is compressed from 375 to 400 and then put into the coils and condensed and the accumulation of that condensation is what makes the raw gasoline.

"Q. Now after the raw gasoline is produced do you blend it with any product? A. Yes, sir.

"By Mr. Diggs: To which we object—

"By the Court: Objection on the same ground overruled and exception saved.

"Q. What do you blend it with?

"By Mr. Diggs: Same objection and exception as above by direction of the court.

"By the Court: Overruled, exception saved.

"A. Blended usually with naphtha.

"Q. Do you weather it after you blend it?

"A. If the vapor tension is too high to ship.

"Q. Well now what do you mean by vapor tension?

"By Mr. Diggs: To which we object as being incompetent and immaterial, not relating to the issues in this case.

"By the Court: Overruled, exception saved.

"A. The vapor tension is the pressure that gathers on the tank after it is confined from agitation or raising of the temperature.

"Q. Why do you weather it, in order to lower that vapor tension?

"By Mr. Diggs: To which we object as incompetent, irrelevant and immaterial, the witness not being shown to act under direction or in concert with the defendant in this case. The manner in which he operates this plant being hearsay and immaterial to this case.

"By the Court: Objection overruled, exception allowed.

"Q. I want to bring out for what purpose you lower the vapor tension? A. To make it safe in shipment.

"Q. How did you describe this product for shipment?

"By Mr. Diggs: To which we object as incompetent, irrelevant and immaterial and hearsay as far as the defendant is concerned and not the best evidence.

"By the Court: I will permit to state how it is billed out. I will permit you to introduce the shipping orders.

"Mr. Payne: Mr. Reporter, mark these two papers Government's Exhibits 22 and 23.

(Said papers were so marked by the Reporter.)

"Q. Mr. Anderson, I show you two papers marked Government's Exhibits 22 and 23—pardon me, Mr. Diggs—and I will ask you to state what they are. I will show them to you in just a moment.

"The Court: Answer the question.

"A. They are forms of bills of lading we use in billing out our product from our gasoline plant.

"The Court: Is that a bill of lading used by them? A. Yes, sir.

"Q. Are those bills of lading in your handwriting, Mr. Anderson? A. Yes, sir.

"Mr. Payne: I offer these in evidence—I beg your pardon.

"Q. State if those shipments were shipments from the points shown on those bills of lading, and state to whom the shipments were consigned and who they were consigned to.

"Mr. Diggs: To which we object as being irrelevant, incompetent and immaterial and not the best evidence.

"The Court: Not the best evidence why?

"Mr. Diggs: To ask him what they state.

"The Court: Here is the way it looks to me—the way to get that in.

"The Court: What do you want to do now?

"Mr. Payne: I offer these in evidence. Strike that out.

"Q. State if you shipped the cars referred to in those bills of lading?

"Mr. Diggs To which we object as incompetent, irrelevant and immaterial, and calls for a conclusion of the witness.

"Q. Do you know what was loaded in those cars?

"A. Yes, sir.

"The Court: Now I will let you prove and describe what was in them, the kind of commodity it was.

"Q. Mr. Anderson, describe what was in the cars?

"A. It was blended gasoline.

"Mr. Diggs: Hold on—to which we object as incompetent, irrelevant and immaterial, hearsay, and this witness has no authority to constitute evidence against this defendant.

"The Court: I will instruct the jury that this evidence will not be considered as any evidence proving as to the name of this material. It will only be introduced for the purpose of showing these shipments, so that if afterwards you find from the evidence submitted to you that what was shipped was not in fact under the rules of law was not in fact unrefined naphtha but was gasoline, that then that lays a predicate on the question of discrimination, but it is not to be considered as any evidence on the issue as to whether or not the commodity that was shipped under these indictments was gasoline.

• • • • •

"Mr. Diggs: Note my exceptions to the ruling of the court.

"By the Court: Describe what that commodity was described in that bill of lading. What it is, where it came from and what it was from and then I will let you go further, probably. You know how to answer that.

"By Mr. Diggs: Was that a question to the witness?

"By the Court: You have your exceptions.

"By Mr. Diggs: Not to that question.

"By the Court: You may have your exception to it on the same grounds named in the other.

"A. It was gasoline blended with naphtha of 72 gravity, 72 to 71 gravity.

"By the Court: What was it made from, that is the question.

"A. It was made from casinghead gas—natural gas.

"By the Court: How?

"A. By compression system.

"By the Court: Had you done anything else to it in any other way?

"A. No, sir.

"By the Court: Now you may go ahead.

"Q. State how that shipment of that product that you have described was billed?

"By the Court: Did you ship any of it anywhere, ship any of it to Port Arthur?

"A. Yes, sir.

"By the Court: From Jenks?

"A. Yes, sir.

"The Court: Now go ahead.

"Q. State how the shipments were described.

"The Court: Now, have you got the bill of lading of that shipment?

"Mr. Payne: These are the bills of lading?

"The Court: Is that the bill of lading?

"A. Yes, sir.

"The Court: Now, identify it.

"Q. Do you identify that as being in your own handwriting? A. Yes, sir.

"Mr. Payne: We offer these in evidence.

"Mr. Diggs: To which we object as being incompetent, irrelevant and immaterial, not being a purported bill of lading, but an instrument made in the handwriting of the witness, not of the railroad company nor its agent.

"By the Court: Let me see it.

"Mr. Diggs: And the evidence of the witness shows—on the further ground the evidence of the witness shows the material shipped was not gasoline but casinghead gasoline.

"The Court: Who is George Anderson, is that your name?

"A. Yes, sir.

"The Court: Now this is not a bill of lading, this is a shipping order.

"A. That is what we use for a bill of lading?

"The Court: Who gave you these?

"A. My company.

"Q. Is that your order to the railroad company to transport these cars? A. Yes, sir.

"The Court: Well that is what is known as a shipping order.

"Mr. Payne. They don't distinguish it, your honor. They call them duplicate originals. I offer these in evidence.

"The Court: Well, let them make their objection.

"Mr. Diggs: We object as being incompetent, irrelevant and immaterial, and hearsay as to this defendant; on the further ground that the cars described here are not shown to have been received by the railroad mentioned, or to be gasoline or to have been transported in interstate commerce.

"Mr. Payne: Your honor, this is the beginning, we will follow that up.

"The Court: Very well, let them be introduced in evidence, and let the record show it as read.

\* \* \* \* \*

"Q. Mr. Anderson, I understood you once in your direct examination to say the substance in these cars, in answer to Mr. Payne's question, was blended; I understood you to say in answer to a question by the court that they consisted alone of the product of your compression plant. What is the fact in that regard?

"A. Sometimes we did ship straight run stuff and other times we shipped blended stuff, that is, blended with naphtha.

"Q. Was the substance in these cars blended or unblended?

"A. That was blended—well, one of them I couldn't say, the liquefied, I suppose, was straight run stuff.

"Q. You suppose that the car in the shipping order described as liquefied petroleum gas was the native product of your compression plant, but the other one is blended. Do you know the proportions of the blend?

"A. No, sir, not exactly. We had to regulate that according to the gravity of the gasoline." (S. M., pp. 294-306, 314, 314A.)

XVII. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 24 and 25, and admitting the testimony of the witness McCarroll, respecting the practice of Crosby & Gillespie, for the same reasons stated with

respect to the evidence of the witness Anderson last mentioned; said testimony being as follows:

"Q. State your full name, Mr. McCarroll?

"A. Charles B. McCarroll.

"Q. Where do you live? A. Kiefer.

"Q. What is your business?

"A. Assistant Superintendent for Crosbie and Gillespie.

"Q. What sort of business is Crosbie and Gillespie in? A. Well, compression gasoline plant.

"Q. A compression gasoline plant? A. Yes, sir.

"Q. State as briefly as you can what your processes of manufacture are beginning with the gas?

"By Mr. Diggs: To which we object as incompetent, irrelevant and immaterial and hearsay evidence as to this defendant; it cannot be bound by the act or proceedings of others.

"By the Court: What is the object of this evidence?

"By Mr. Payne: There are five discriminate counts from Jenks and five from Kiefer.

"By the Court: Their plant at Kiefer?

"By Mr. Payne: Yes, sir.

"By the Court: The objection is overruled.

"By Mr. Diggs: We save our exceptions.

"Q. Describe briefly your process of manufacture first beginning with the well?

"By the Court: Get your shipping order.

"By Mr. Payne: This witness did not make out the shipping orders, we have another witness for that.

"By the Court: Let him stand aside and get that witness in here. Let's have some systematic process.

"By Mr. Payne: I first thought I would show it was produced and then it was shipped.

"By the Court: Go ahead.

"Q. Go ahead McCarroll?

"A. It was taken out of the well through a vacuum process, delivered to the plant and we put it through two stages, low stage and high stage, take the gasoline out and we blend into naphtha take about a third blended to certain gravity, deliver into tank cars and we are through with it.

"By the Court: You get the casinghead gas from the well, and pipe it to your plant?"

"A. Yes, sir.

"The Court: And then you carry it through the compression process?"

"A. Yes, sir.

"By the Court: Then blend that product with the naphtha.

"A. Yes, sir.

"By the Court: Go ahead.

"Q. During the period from January 1, 1918, to June 1, 1918, did you manufacture some compression gasoline from the Texas Company?"

"By Mr. Diggs: To which we object as being incompetent, irrelevant and immaterial, not binding upon this defendant.

"By the Court: Overruled.

"By Mr. Diggs: Exception.

"By the Court: It looks to me like you could shorten this if you asked if he shipped any of this product to the Texas Company.

"By Mr. Payne: Your honor I want to show he sold it to the Texas Company at Kiefer and the Texas Company shipped it.

"By the Court: Very well.

"A. You want me to give the amount?"

"Q. No, just state whether you shipped anything during that period? A. Yes, sir.

"Q. Whether you manufactured some compression gasoline for the Texas gasoline during that period and sold it to the Texas Company? A. Yes, sir.

"Q. Do you recall the terms?"

"By the Court: Let me find out about that. Where did you deliver it to the Texas Company?"

"A. On the tank car on our siding.

"Q. On your siding at Kiefer? A. Yes, sir.

"By the Court: What is the allegation in your indictment?"

"By Mr. Payne: The allegation is as I remember the Texas Company as consignor and the Texas Company as consignee shipped from Kiefer to Port Arthur, that they were actually shipped by the Texas Company.

"By the Court: Let's see what is states. We

are losing lots of time, you ought to know what the necessary allegations in the indictment are. Just read it to him—read what the allegation is—just let me have it.

“Q. That throughout the last mentioned period the Texas Company (beginning at page 5 your honor).

“By the Court: Go ahead.

“Q. And under your contract you delivered it to the Texas Company in the cars at Kiefer, that correct?

“A. Yes, sir.

“By Mr. Diggs: To which we object, incompetent, irrelevant and immaterial and not binding on this defendant and the contract that this witness had with the Texas Company being the best evidence of the contract.

“By the Court: Well I will strike out everything about the contract. I will let him prove this commodity was the kind and description that he delivered certain cars to the Texas Company.

“By Mr. Payne: At Kiefer?

“By the Court: Yes, at Kiefer.

“Q. McCarroll, you stated that this casinghead gasoline was blended with naphtha, was it not?

“The Court: How many cars of that kind?

“A. In that length of time?

“The Court: During that period.

“A. I couldn't answer that just exactly. We delivered about forty-five to fifty a month.

• • • • •

“Q. Where did you get the naphtha with which you blended these shipments, that was delivered to the Texas Company at Kiefer?

“Mr. Diggs: To which we object as incompetent, irrelevant and immaterial, and not binding on this defendant.

“The Court: Objection overruled and exception saved.

“Mr. Diggs: We save our exceptions.

“A. From the Texas Company at West Tulsa.

“Q. Where? A. West Tulsa.” (S. M., pp. 316-320.)

“Q. I show you two papers marked Government's exhibits 24 and 25 and will ask you if you identify these documents as made out by you?

"A. They were made out according to my instructions.

"Q. Under your supervision?

"A. Yes, sir, I could not say I made them out personally.

"Q. State what the papers are, please, sir.

"A. They cover shipments—

"By Mr. Diggs: We object incompetent, irrelevant and immaterial and not the best evidence.

"By the Court: I overrule the objection.

"By Mr. Diggs: I except.

"By the Court: State what they are but not the contents.

"A. Shipping orders of bills of lading covering movement of cars from Kiefer, Oklahoma, to Port Arthur, Texas.

"By the Court: They are the best evidence as to what they are.

"By Mr. Payne: I offer these in evidence.

"By Mr. Diggs: We object, incompetent, irrelevant and immaterial, no connection of the defendants being shown this being transaction with different parties with whom the plaintiff has not shown to have any connection and undertaking to bind it by acts of third parties.

"By the Court: The objection is overruled.

\* \* \* \* \*

"Q. Do you know that during the period from January 1, 1918, to June 30, 1918, that the Texas Company bought from Crosbie and Gillespie at Kiefer all of the output from their plant at Kiefer? A. I do.

"Mr. Diggs: To which we object as being incompetent, irrelevant and immaterial and a transaction between third parties with whom this defendant is not connected or identified.

"The Court: That is admitted only for the identification of these cars.

"Mr. Payne: That is all.

"Mr. Diggs: That is all.

"Witness excused.

"The Court: I will let you recall Mr. McCarroll. I will let you ask that question. I was under the impression that the evidence showed. But I will let you ask the question if all the cars loaded, wheth-

er or not it was the product blended with the naphtha. You may recall him and ask him that.

"Whereupon CHARLES MCCARBOLL was recalled for further direct examination by the Government:

"Mr. Payne: I did not catch the significance of your honor's statement.

"The Court: I remember the question I asked him, if all the product described made by that plant was turned over to the Texas Company and he said yes, but he described the product, casinghead gas extracted by compression and he described the blended article so there might be some confusion, so now you can repeat the question that I did not permit you to ask him.

*Examination by Mr. Payne.*

"Q. Are you the same Charles McCarroll who testified a few moments ago? A. Yes, sir.

"Q. Did you receive from the Texas Company at Kiefer cars of naphtha shipped to Kiefer from the Texas Company at West Tulsa? A. Yes, sir.

"Q. And what did you do with that naphtha?

"Mr. Diggs: To which we object as being irrelevant, incompetent and immaterial.

"The Court: Objection is overruled.

"Mr. Diggs: I except.

"A. I used it to blend with.

"Q. In what proportion did you blend the casinghead gasoline?

"A. About a third, used about one-third naphtha, different—

"Q. Do you know what the specifications for the product you sold to the Texas Company were?

"A. I cannot answer it." (S. M. pp. 326, 327, 329-331.)

XVIII. In admitting the testimony of the witness, Haigh, respecting the practice of the Ajax Gasoline Company concerning its shipments, for the reasons stated secondly above respecting the practice of the Totem Gasoline Company; said testimony being as follows:

"Q. What is the name of the casinghead gasoline plant of which you are superintendent?

"A. The Ajax Gasoline plant.

"Q. Located at Jenks? A. Yes, sir.

"Q. How long have you been connected with that institution?

"A. I have been superintendent for about twenty months.

"Q. You have been superintendent for about twenty months and how long have you been with that institution?

"A. Little over three years.

"Q. Have you been with any other casinghead gasoline plant prior to that time? A. No, sir.

"Q. What were your duties and position when you first went with the Ajax? A. Chief engineer.

"Q. Did that have anything to do with the manufacture of the product from casinghead gasoline plants?

"A. Yes, sir.

"Q. Well it was merely the mechanical work of running your engine, was it or did you have something else to do with the manufacturing of the materials?

"A. I had charge of the plant operation entirely.

"Q. You had charge entirely of the operation or cars? A. No, the entire operation of the plant.

"Q. Are you familiar with the methods used in compression plants—is yours a compression plant?

"A. Yes, sir.

"Q. Are you familiar with the method by which the product is manufactured and produced at the casinghead plant? A. Yes, sir.

"Q. What is the name of the commodity which you produce? A. Gasoline.

"By Mr. Diggs: If the court please we move to exclude the answer of the witness on the ground it is not shown he possesses this expert knowledge necessary to state the name and character of the article produced.

"By Mr. Chambers: I cannot conceive of a more competent man to determine the product than the man who produces himself and has familiarized himself with the product and made it before it is produced as an expert, I mean.

"By Mr. Diggs: In order to save time and save my record on this character of evidence of witnesses on this subject if it may be agreed the defendant has the right to strike it out after the close of the Government's case if it is not relevant and material I will wait until then and save a whole lot of time in putting in exceptions to the different questions.

"By the Court: Very well.

"Q. How long have you been producing this material from the compression plant, Mr. Haigh?

"A. Ever since the plant was built three years ago.

"Q. Did you ship your product from the casinghead plant? A. Yes, sir.

"Q. And prior to the shipping of the commodity——

"By the Court: Let me see, just wait. What sort of a plant is that, a compression?

"A. A compression plant, casinghead.

"By the Court: Casinghead gas?

"A. Yes, sir.

"By the Court: And you get that from the gas pumped from the wells?

"A. Gas comes off the oil wells.

"By the Court: And then you compress it?

"A. Yes, sir.

"By the Court: And what do you say now when you compress it, what do you call it, what do you call the commodity after it is compressed.

"A. Gasoline after it condensed.

"By the Court: What do you mean by condensed?

"A. Run through a set of cooling coils and condensed into a liquid form.

"By the Court: Q. That is a part of the process of compression?

"Mr. Chambers: That is a part of the process they have all testified to.

"The Court: Well, I am asking him.

"Q. That is a process of compressing, the condensing of it? A. Yes, sir.

"Q. Then you say, after you get it through the compression, you call it gasoline? A. Yes, sir.

"Q. Suppose you were to combine one-third naptha and two-thirds of the commodity after it was compressed, what would you call it then? A. Gasoline.

"Q. Just the same name you would before?

"A. Yes, sir.

\* \* \* \* \*

"Q. Now, do you produce, prior to shipping the gasoline, which you take from the compressor plant, do you prepare that for shipment in any other way excepting by blending? A. No, sir, not at our plant.

"Q. You don't weather it at your plant?

"A. No, sir, it is not necessary.

"Q. Now, how many gasoline plants are there at Jenks of this character? A. I don't know.

"Q. Well, you know some of the plants there, don't you? A. Yes, sir.

"Q. Well, can you name some of them? A. Yes, sir.

"Q. I wish that you would give all that you know of and that you remember.

"A. Well, there is the Totem, John Tell, Kelly, Swanson & Black; Texas Company; Tribes Gasoline Company and the Oklahoma Petroleum & Gasoline Company; Oil States Gasoline Company; Gypsy.

"Q. Would you say that Jenks is quite a place for the manufacture of this commodity in the manner in which you manufacture it?

"Mr. Swacker: I would like to object to that; not shown the witness is qualified; quite a place is a very indefinite term.

"The Court: How many casinghead plants are there?

"A. I don't know.

"The Court: Well, about how many, as many as ten?

"A. I think so.

"The Court: Well, you know whether there is ten or not don't you?

"Mr. Chambers: Give your best judgment.

"A. Yes, my judgment is that there is at least ten.

"Q. Now, then, these plants that manufacture this commodity that you call gasoline, do they manufacture that by the compression method? A. Yes, sir.

"Q. Are you familiar—you are familiar with the manner in which various plants manufacture their gasoline? A. No, sir.

"The Court: How many plants are you familiar with, as to how they manufacture?

"A. I am familiar with all that our own company owns.

"The Court: How many do they own?

"A. Five.

"Mr. Chambers: This is going to be a leading question, and don't answer it.

"Q. You have tried to inform yourself with the manner in which the other plants operate, haven't you, and the character of the plant, as to whether they manufacture this gasoline by compression the same as you do?

"A. Yes, sir.

"Q. And you have informed yourself with reference to that matter, haven't you?

"A. I know that all of them operate on the compression system there.

"Q. Well, the compression system, they may use different machineries, but the system and the plant and the method is exactly the same, and has to be, don't it?

"A. Not necessarily.

"Q. I mean in the compression plant.

"The Court: In principle?

"A. In principle, it is the same.

"Q. In principle, the compression plant of all of them is the same? It is the same method of getting out the gasoline from the casinghead gas, ain't it? A. Yes, sir.

"Q. Now, then, you ship your commodities, you say, after you blend it? A. Yes, sir.

"Q. I will ask you to state, how long have you been shipping it? A. Billing it, you mean?

"Q. Yes, billing it out. A. Since August, 1918.

"Q. And I will ask you to state the designated name by which you bill out your commodity?

"Mr. Diggs: I suppose this would still fall under that objection—

"The Court: Yes.

"A. We bill it as liquefied petroleum gas.

"Q. As liquefied petroleum gas. Under what condition?

"Mr. Diggs: Now, we move to exclude the statement of facts contained in that and immaterial under the issues in this case.

"The Court: Yes. I don't think that is competent.

"Mr. Chambers: You mean as to the manner in which he bills it out?

"The Court: How could that affect it?

• • • • •

"The Court: Go ahead. I will let it in subject to be moved to be stricken out.

"Q. How did you bill your commodity?

"A. Liquefied petroleum gas.

"Q. Was it billed as liquefied petroleum gas where the pressure was below the ten pounds vapor pressure?

"A. No, sir.

"Q. When you blend the commodity that you get

from your plant with the naptha, that is what you blend it with, ain't it? A. Yes, sir.

"Q. When you blend it with that, doesn't it bring it down below the ten pound vapor pressure? A. No, sir.

"Q. Well, it does occasionally bring it down?

"Mr. Diggs: Your honor, I think counsel should be required to keep within the rule and not suggest the very answer.

"The Court: Yes, I think that. Don't lead the witness.

"Q. What is the effect of blending your gasoline that you take out of your compression pipe with the naptha, with reference to the vapor tension? A. It lowers it.

"Q. Is it your purpose—or, what is your purpose with reference to blending it? That is, as to whether or making it subject to be shipped?

"A. Yes, sir, simply for market.

"Q. Putting it upon the market? A. Yes sir.

"Q. Now, if it is above the ten pound vapor pressure, you designate it in your shipping order liquefied petroleum gas? Do you ever ship any where the vapor pressure is less than ten pounds?

"A. We have. We haven't any at present.

"Q. And how did you designate that?

"A. Gasoline.

"Q. For what reason did you designate this commodity liquefied petroleum gas when you shipped it and it was above the ten pound vapor pressure?

"A. By order of the Bureau of Explosives.

"Mr. Chambers: That is all.

*"Cross Examination by Mr. Diggs.*

"Q. Did you say your name was Haigh? A. Yes, sir.

"Q. Mr. Haigh, is it a part of your business, as superintendent of the plants you have named, to attend to the shipping of your product? A. Yes, sir.

"Q. In shipping that product, it is your purpose to bill and describe it by the name which you consider it should be billed under the tariffs established by the Interstate Commerce Commission, is it?

"A. I bill as ordered by our sales office.

"Q. What?

"A. I bill as I am ordered to by our sales office.

"Q. Then, if you bill it as ordered by your sales office, you don't bill this product because you consider it to be gasoline or liquefied petroleum gas, but because you receive orders from your superiors so to bill it?

"A. Primarily, yes, sir.

"Q. You say that you know this product to be gasoline and can you tell me the constituent elements of the product known on the market generally as gasoline?

"A. No, sir.

"Q. Can you tell me the constituent elements of the product you produce from your plant which you say is gasoline? A. No, sir.

"Q. Can you tell me the particulars in which the product produced by you resembles or has in common with the article 'generally purchased on the market as gasoline'?

"A. It has practically the same burning and explosive qualities, the gravity and vapor tensions are the same as the other articles.

"Q. The products produced by you you think has the same gravity as the gasoline you buy on the market do you? A. After it is blended.

"Q. After it is blended. How much do you blend?

"A. 56 to 58.

"Q. Now as a matter of fact before you blend this article you call it raw gasoline don't you? A. Yes, sir.

"Q. After you blend it you call it naphtha blend, don't you?

"A. We have always designated it as gasoline.

"Q. You have always designated it in your plants as gasoline. And the product that you shipped as liquefied petroleum gas is the same article you call gasoline except one has a blend in it and the other has not. Is that true?

"A. I can't say.

"Q. You can't say. I understood you to say you had charge of the shipping. A. Yes, sir.

"Q. And it is your duty also to see to the production of this article? A. Yes, sir.

"Q. And how it gets on the market. In that connection are you familiar with the rules provided by the Corporation Commission as to how the product produced by your plant shall be sold and when it shall be called and treated as gasoline and when and how it shall be called and considered unrefined naphtha?

\* \* \* \* \*

"Q. Mr. Haigh, what is the gravity of the raw casinghead gasoline produced by you?

"A. It varies from 80 to 84.

"Q. Varies from 80 to 84. To what gravity do you reduce it before shipping? A. Above 56 and below 58.

"Q. When your raw casinghead gasoline is produced and the gravity is between 80 and 84, did you say?

"A. Yes, sir.

"Q. Between 80 and 84, is that commodity in shape to be generally used in the market as gasoline? A. No, sir.

"Q. It is not. All the part of your gasoline that you ship and sell in Kansas City is shipped to refineries, is it?

"A. No, sir.

"Q. It is not. All the raw that you ship is shipped to refineries? A. It has been in the past.

"Q. I say, all you have shipped was shipped to refineries? A. Yes, sir.

• • • • •

"Q. Was there a rate on unrefined naphtha between the shipping point to which you shipped your blended gasoline from and to the points to which they were shipped?

"A. I do not know.

"Q. On unrefined naphtha?

"The Court: He said he did not know.

"A. I don't know.

• • • • •

"Q. And your only purpose in designating, you only designated the name under which this product is shipped in the bills of lading by the direction of your superior?

"A. Yes, sir.

• • • • •

"By the Court: Mr. Haigh what did you say was the gravity of raw casinghead gasoline after you had blended it for shipping?

"A. Between 56 and 58.

"Q. When you had reduced that raw casinghead gasoline as you call it to 56 or 58 gravity the article you would ship north then would only have from five to ten per cent or a little more than that of casinghead gasoline in it wouldn't it? A. It would be more than that.

"Q. You think so? A. I know that.

"By Mr. Diggs: Alright.

• • • • •

"Q. Mr. Haigh after you have produced your raw gas with gasoline by blending to 56 to 58 gravity how much of your original raw casinghead gasoline is in that mixture so prepared? A. About twenty-five per cent.

"Q. How much of that original casinghead gasoline would be in there at the time it got to market?

"A. I don't understand the question.

"Q. Can you state how much at the time this blended product gets to market are you able to state approximately, what at the time you ship it, are you able to state approximately how much of the original casinghead gasoline would be in it in your judgment?

"A. About twenty-five per cent at the time we ship it; I don't know about the arrival.

"Q. 25 per cent at the time you ship it. Alright that is all.

\* \* \* \* \*

"By the Court: What proportion do you use in blending?

"A. Well it varies to seventy-five per cent naphtha to reduce it to that gravity.

"By the Court: You would have about two of naphtha and one of casinghead gasoline?

"A. Nearly three to one." (S. M., pp. 413-420, 424-427, 430, 433-436.)

XIX. In admitting the testimony of the witness League in substance, that the commodity shipped by the Gypsy Oil Company from Kiefer before December 2, 1916, in the opinion of the witness, was of the same character as that shipped after said date; for the reason that it violated the *res inter alios acta* rule, and further that said witness was not qualified to give opinion evidence.

Said testimony being as follows:

"Q. Prior to December 2, 1916, did he use any other term except casinghead gasoline?

"A. Not that I ever heard.

"Q. Did Mr. Millard? A. That is all I ever heard.

"Q. Did Mr. Millard use the term casinghead gasoline prior to December 2, 1916, in his own conversations with you? A. Yes, sir.

"Q. Did he use any other terms? A. No, sir.

"Q. After December 2, 1916, did you examine the commodities that they had down there? A. Yes, sir.

"Q. Can you tell whether it was the same commodity you examined prior to December 2, 1916?

"By Mr. Swacker: Now I merely wish to object to that as being incompetent, irrelevant and immaterial on the same basis we made objection to all of that matter, outside the period of time when there was an unrefined naphtha rate in effect on the grounds

it violates the res inter alios acta rule. Just save an exception.

"By the Court: Now what time did you ask him about?

"A. I am asking him now if he had a conversation with Mr. Millard with reference to the designated name of the commodity prior to December 2, 1916, as to what it was. He said it was gasoline. Now I asked him if he called it any other name.

"By Mr. Swacker: He said casinghead gasoline.

"By the Court: I don't think he can prove conversation with Mr. Millard. I will allow you to prove the conduct of the business what they shipped and what they did. Now to prove what some man says unless he is the agent of this company I don't think you can do that.

"By Mr. Chambers: He was the superintendent.

"By the Court: Not of the Gulf Refining Company. The Gypsy is not on trial.

"By Mr. Chambers: I understood we had that connected up.

"By the Court: I don't so understand.

"By Mr. Chambers: Then that will necessitate recalling this witness.

"By Mr. Diggs: I don't like to interrupt the gentlemen but it appears in this record already that this so called casinghead gasoline was always shipped under the name of gasoline prior to—

"By the Court: They want to prove prior to that the officers Mr. Millard, the manager and superintendent stated that. I won't allow them to do that unless they show that the Gypsy was the agent of the Gulf. Now the act, that is a fact, the action of the company what they did, that is a fact.

"By Mr. Chambers: I think we have been misled. I think I have misstated it and I think—the question I asked was as to whether or not the material he investigated afterwards was of the same character of material he investigated prior to December 2, 1916. That was the question I believe.

"Q. In your opinion, was the commodity that you testified you investigated after December 2, 1916, the same commodity, the same character and same commodity investigated prior to that time? A. Yes, sir.

"The Court: I will let him prove that, but not what the officer said.

"Mr. Swacker: I make the same objection. It is irrelevant, incompetent and immaterial." (S. M., pp. 444 447.)

XX. In admitting the testimony of the witness League concerning the practice followed by Chestnut & Smith; said testimony being as follows:

"Q. Now, what other plant, tank cars of some other companies did you inspect?

"The Court: Any other plant, you testified about the plant at Kiefer, of the Gypsy Oil Company plant. Any other plant?

"A. Yes, sir. The Chestnut and Smith.

"Mr. Chambers: Have they been—

"The Court: No, sir, nothing said about it.

"Q. Did you investigate it there, those cars?

"A. Yes, sir.

"Q. Is that the same character of compression plants, same method of making casinghead gasoline that the Gypsy Company has? A. Yes, sir.

"Q. Was that a blended material? A. Yes, sir.

"Q. Do you know how that was shipped? A. Yes, sir.

"Mr. Swacker: Just a minute.

"Q. I will ask you to state what was the designated term under which that was shipped? Don't answer the question.

"Mr. Swacker: We desire to make an objection.

"The Court: You proved it was a blended material. What do you mean by a blended material?

"A. Raw casinghead gasoline blended with some other petroleum product.

"By the Court: Do you mean naphtha?

"A. Yes, sir, that is one of them.

"By the Court: I think that is too indefinite.

"Q. Do you know whether this company blended their casinghead gasoline with naphtha or not? A. Yes, sir.

"Q. Did they blend it with naphtha? A. Yes, sir.

"By the Court: Well now if he knows how they shipped that which was blended with naphtha, I will permit him to state the practice of shipping that.

"Q. Answer the question.

"By Mr. Swacker: Now we object as being incompetent, irrelevant and immaterial. In the first place the circumstances not being shown to be similar or identical to admit evidence with regard to that.

"By the Court: Wherein are they not similar. I am confining the question to the blended material where it is from the combination of the product resulting from a compression of the casinghead gas with the naphtha.

"By Mr. Diggs: If the court please if you will permit us to state our objection then we will take up the question of the court wherein the similarity exists.

"By Mr. Swacker: I will take that question up for a moment. The similarity or lack of dissimilarity is insufficiently shown in this respect. This witness does not know nor has he attempted to state the quality of material or degrees of blending or quantities used in blending, whether the result in blending is anything like the same stuff shipped by the Gypsy and in the second place he is not attempting to confine it to points where there were unrefined naphtha rates in effect.

"By the Court: I will overrule you on that point. What then, what about the question of naphtha blended with the raw—what you call the raw casinghead gasoline if you know how that effect just what the product was?

"A. If I knew the quantity of naphtha in each blend.

"By the Court: What would the quantity of naphtha in each blend would that depend on the character of what the blended article was?

"By Mr. Swacker: Would that determine what the blended article was?

"By Mr. Chambers: That is for shipping purposes.

"By the Court: Well what the commercial name would be.

"A. That would not affect the name.

"By the Court: That would not affect the commercial name?

"A. No, sir.

"By Mr. Swacker: Now I object to his answer on that as part of the evidence offered on the ground that he has not been qualified as to what were the commercial names of this product.

"By the Court: I should think he should know, he is a man that it is an inspector.

"By Mr. Swacker: Well, he doesn't inspect for the purpose of sale. He inspects for the physical characteristics.

"By the Court: Now when you make your inspection and make your report do you designate the name of the product that is in there that you inspect?

"A. Yes, sir.

"By the Court: Where do you get that name from?

"A. We know that that is a gasoline plant before we go there, they make nothing else.

"By the Court: Here is the point I want to know; is whether or not you solely make the designation of the name from your information or whether you get that from the different plants you talk to around or the trade, how do you determine the name you will give the product you have inspected.

"A. I use the name that is known generally.

"By the Court: How do you ascertain the name that is known generally, for instance they, you go down there and you find this commodity. Here is raw casinghead gasoline, gasoline which has compressed and you find some naphtha in there. Where do you get the information by which you designate the name that you are going to mark that car; how do you get the information to designate the name of that car?

"A. By the name it is known by among the men around the plant, for instance, or among shippers of that commodity.

"By the Court: How long have you been at this business?

"A. Since March 1, 1916.

"By the Court: What was your business prior to that?

"A. Assistant train master, P. & P. U. Railroad Company.

"By the Court: I believe I will let him answer the question, state your exceptions.

"By Mr. Green: May I make one suggestion to the court? We take the position that it is immaterial first, even though it might be known as gasoline generally yet if the court determines from the evidence we introduce here that it is further refined at Port

XXI. In admitting the testimony of the witness League respecting the practice of D. W. Franchot; said testimony being as follows:

"Q. Now do you know D. W. Franchot? A. Yes, sir.

"Q. Are they are Kiefer? A. Yes, sir.

"Q. What do they do?

"A. Make casinghead gasoline.

"Q. And do they blend and ship it? A. Yes, sir.

"Q. And have you up to the time during the time that you have been inspector in Oklahoma, have you examined and inspected those tank cars? A. Yes, sir.

"Q. Have you examined and inspected the blended, where they blended with naphtha? A. Yes, sir.

"Q. Where the naphtha is blended with casinghead gasoline? A. Yes, sir.

"Q. And how do they ship their product? As gasoline? A. Yes, sir.

"By Mr. Swacker: Same objection and exception.

"By the Court: Same objection and exception."  
(S.M. pp. 470, 471.)

XXII. In admitting the testimony of the witness League respecting the practice of D. W. Franchot; said testimony being as follows:

"Q. Now let me ask you did these people ship this product as gasoline after December 2, 1916?

"By Mr. Diggs: To which we object, incompetent, irrelevant and immaterial, the transaction being between third persons, and having no connection with the Gulf Refining Company and not shown to have been brought to the knowledge of the Gulf Refining Company and not being the best evidence of how they shipped and under what condition it was shipped.

"By the Court: Well now if you are going to go on that of course that will force them to send down there and get their railroad records. Now you have your point on the law. That allows you your exception. I will sustain the objection and require them to send after them.

"By Mr. Diggs: If the court please I am not putting the words 'the best' in there, strike out the word best and I will say hearsay.

"By the Court: Very well.

"Q. Now after December 2, 1916, you inspected that plant? A. Yes, sir.

"Q. Of the Franchot? A. Yes, sir.

"Q. And were they shipping this commodity as gasoline after December 2, 1916?

"A. They billed it that way, yes, sir.

"Q. That is what I mean? They billed it as gasoline?

"A. Yes, sir.

"By Mr. Diggs: Same objection and exception." (S. M., pp. 471, 471-A.)

XXIII. In admitting the testimony of the witness League respecting the practice of the Ajax, Tribes and Eagle plants; said testimony being as follows:

"Q You have examined the Ajax, Tribes and Eagle?

"A. Yes, sir.

"Q. Now, as to the Tribes Gasoline Company, did you make any inspection *if* it—of the manner in which it makes its commodity?

"Mr. Swacker: We will make this admission as to any of the plants that the witness may name that you contend that that is a fact, that the witness, if you ask him those questions, will testify the same, and that subject to our objection and exception.

\* \* \* \* \*

"Mr. Swacker: Have you been there and inspected them?

"A. All but the Giltland.

"Mr. Swacker: And you have inspected them likewise under the same circumstances?

"A. Yes, sir.

"Q. And during the time prior to December 2nd and after December 2nd, 1916, up to May 2nd, 1919, as far as the inspection—— A. Yes, sir.

"Mr. Swacker: We admit the testimony would be the same with reference to this as to the other, with the same objections.

"The Court: All right

"Mr. Green: I would like to get the court to instruct the stenographer to make the memorandum that all of the objections that were granted, reserved by the defendant to the first plant about which he testified, applied to all of these others, all of the exceptions.

"The Court: All objections and exceptions ap-

ply to every one except that it was not the best evidence.

"Mr. Green: Yes, sir." (S. M., pp. 472, 474.)

XXIV. In admitting the testimony of the witness League respecting practices of other shippers; said testimony being as follows:

"Q. Referring to the different blends of casinghead gasoline with naphtha and kerosene and other blends when it is blended with naphtha how is it usually shipped on the billing by the shipper? A. Gasoline.

"By Mr. Swacker: I objection, incompetent, irrelevant and immaterial.

"By the Court: Overruled.

"By Mr. Swacker: I except.

"Q. When it is blended with kerosene how is it usually shipped?

"By Mr. Swacker: I object to that as incompetent, irrelevant and immaterial.

"By the Court: Overruled.

"By Mr. Swacker: I except.

"A. Gasoline.

"Q. When it is blended with crude oil how is it usually shipped? A. Gasoline." (S. M., p. 512.)

XXV. In admitting the testimony of the witness League respecting what he had not seen done by other shippers; said testimony being as follows:

"Q. Have you seen the bill or shipping orders describing the shipment consisting of the blend of casinghead gasoline and naphtha to any other refinery as unrefined naphtha?

"Mr. Swacker: I object as incompetent, irrelevant and immaterial and not being shown that the tariff or classifications permitted such shipment.

"The Court: Objection overruled.

"Mr. Swacker: I except.

"A. No, sir." (S. M., pp. 515, 516.)

XXVI. In admitting the testimony of the witness League concerning the meaning of the term "raw casinghead gasoline"; said testimony being as follows:

"Q. When you spoke of raw casinghead gasoline, just what did you mean? A. Unblended.

"Q. Did you mean to intimate, by calling it raw casinghead gasoline that it was in a crude or unrefined state?

"A. No, sir.

"Mr. Swacker: I object to that as incompetent, irrelevant and immaterial. He stated the source of his knowledge of the names as one in use among the people.

"The Court: I will overrule the objection. You may have an exception.

"Mr. Swacker: I object, on the further ground, that the witness is not shown to be qualified to express any opinion as to whether anything is refined or unrefined.

"The Court: I will let him answer.

"Mr. Swacker: Exception." (S. M., pp. 516-518.)

XXVII. In admitting the testimony of the witness Scott respecting practices of other shippers; said testimony being as follows:

"By the Court: Now in this business have you been brought into contact so as to know the terms they use when they sell this commodity and the names they call it by?

"A. Only the names under which they ship it.

"Q. Now then in these various places that you have stated to the court in all of these places they ship casinghead gasoline blended with naphtha?

"A. Naphtha and kerosene.

"Q. Naphtha and kerosene? A. Yes, sir.

\* \* \* \* \*

"Q. Does the performance of your duties bring you into contact with the people that manufacture casinghead gasoline? A. Yes, sir.

"Q. Do you have occasion to go through their plants and see the methods by which they manufacture these products? A. Yes, sir.

"Q. Do you talk with them with reference to what is the name of the product which they manufacture.

"A. Yes, sir.

"Q. I will ask you to state what is the designated term by which they refer to this particular commodity and these various blends.

"By Mr. Swacker: I object, irrelevant and immaterial and there is no connection shown in what respect they refer to it. If they are referring to it in connection with his functions that of course is limited to the safe transportation regulations.

"By the Court: In what way would you be talking to them?

"A. When they give it a name and call it?

"By the Court: Yes.

"A. I am required to find out the pressure they use as to low and high stage, whether it is blended or unblended, whether it is steamed, temperature of the steam, whether the plant provided with appliances, storage facilities, storage capacity, and—

"By the Court: And it is in that capacity you come in contact with them and talk with them?

"A. Yes, sir.

"By the Court: I will let him testify.

"Q. Now what do they call it? A. Gasoline.

"Q. Was this the name they called it prior to December 2, 1916, and after December 2, 1916.

"By Mr. Swacker: I object to that as incompetent, irrelevant and immaterial.

"By the Court: Very well he may answer. It was the same product?

"A. Yes, sir." (S. M., pp. 532-534.)

XXVIII. In admitting the testimony of the witness Barnhart respecting the practice of his company; said testimony being as follows:

"Q. And do you ship the commodity that you manufacture and the casinghead gasoline before it is blended, or do you then blend it with other products?

"A. We don't blend.

"Mr. Diggs: To which we object, as incompetent, irrelevant and immaterial and hearsay, as against this defendant, and I don't want to keep making these objections. Subject to the motion to strike out.

"The Court: Yes, go ahead.

"Q. You say you don't blend it?

"A. I don't. I weather it.

"Q. You weather it? A. Yes, sir.

"Q. Do you ship it before you weather it? A. No.

"Q. You don't ship it where it is above the ten pound vapor? A. No.

"Q. You weather it? A. Yes, sir.

"Q. And then you ship it? A. Yes, sir.

\* \* \* \* \*

"Q. Now, how do you designate—what name do you ship it under when you ship it? A. Gasoline.

"Q. Do you sell it to the people up in Wisconsin?

"A. Yes, sir.

"Q. You sell it to them?

"A. Yes, sir; the company does; they give me orders.

"Q. And they sell it on orders from the company up there? A. Yes, sir.

"Q. And do you take the gravity of this commodity after it has been weathered? A. Yes, sir.

"Q. And what would you say was the general—generally speaking, what is the gravity?

"A. Well, anyways from seventy to seventy-five; it ain't all the same.

"Q. From seventy to seventy-five gravity?

"A. Yes, sir." (S. M., pp. 536, 537.)

"Q. Is the article you shipped to Wisconsin as gasoline there is there any other term or name under which you could ship it to the point you did ship it to of your own knowledge? A. There ain't any that I know of.

"Q. That is the only name you know of under which that particular product of the company can be shipped to the point you shipped? A. Yes, sir.

"By the Court: Did you ever investigate to see?

"A. Well no, I did not.

"By the Court: That is proving your negative without laying the foundation.

"By Mr. Diggs: I am proving more to show his knowledge bearing on his knowledge of the facts, that is all.

\* \* \* \* \*

"By the Court: Now as to the rates to these different points this expert can go out and make a memorandum of that and return into court and read it into the record showing the fact each side ought to agree to that. They are entitled to have it in here the way this rate is here to these points and then we can see if it is gasoline or unrefined naphtha and they should go on and say which it is and the expert ought to get it up and you ought to be able to agree to that.

"By Mr. Gann: There seems to be an impression in this trial the shipper cannot name the commodity any name except the name designated in the tariff and rules and it has always been the custom for the shipper to designate whatever commodity it is and the duty of the railroad company to apply that tariff to the commodity so designated.

"Mr. Swacker: Your honor has suggested to us that we would have to produce proof concerning the rate.

"The Court: Now, to my mind, a man who is not a rate man says he don't know. That wouldn't prove anything. They ought to allow this Interstate Commerce rate man to say what it is and put it in the record.

"Mr. Swacker: Our contention was that the only way it would have been competent evidence would be if they had laid a foundation by showing that there was a choice of rates. Your honor puts it up to us to show all the rates.

"The Court: You have your exceptions." (S. M., pp. 539-541.)

XXIX. In admitting the testimony of the witness Otey and the statement of Government's counsel respecting the contents of the document excluded by the court as inadmissible; said testimony being as follows:

"Q. Referring to an item on the second page of this exhibit, reading 'Painters naphtha, tank 838, car 2187, order number', will you state what that indicates?

"Mr. Swacker: Now, I would like to make an objection to this method of examination. The court has ruled that paper is not proper evidence, and the prosecuting officer is simply reading items from it, incorporating them into the question, which is exactly the same as if the paper was put in evidence.

"The Court: He can show him that and ask him what that means.

"Mr. Swacker: He is reading the contents of the paper into the record.

"The Court: I will permit him to do that.

"Mr. Swacker: Exception.

"Q. What does that order number there indicate to you?

"A. Why, no more than every tank car that naphtha had an order number." (S. M., pp. 549-550.)

XXX. In admitting the testimony of the witness Otey in substance, that certain cars contained painters' naphtha; said testimony being as follows:

"Q. Where did you get the order number shown on this sheet of April 11, order number 11348, showing painters naphtha as in cars 2187 and the three following?

"Mr. Swacker: I beg to object to that same statement over and over again, 'showing painters naphtha in' certain cars, and so forth.

"The Court: I will overrule the objection. You may have your exception. Go ahead.

"A. What is that again?

"Q. How do you know what the order number was?

"A. From the car slips." (S. M., p. 555.)

XXXI. In admitting the evidence while the witness Sanderson was on the stand respecting the practice of the Gypsy Oil Company before and after December 2, 1916; said evidence being as follows:

"Q. That is you know they were producing the casinghead gasoline at the plant, you know they were receiving a material from the South that they blended with that and you know they shipped that out?

"A. Yes, sir, that would be my memory of it.

"Q. And do you know where they shipped it?

"A. No, I could not say definitely, I did not look after that.

"Q. Do you know the designated term, the name under which they shipped it?

"By Mr. Swacker: We would just like to make the same objection we have made all along on that point as incompetent, irrelevant and immaterial.

"By the Court: Very well you may reserve the same right to strike out the evidence as the other.

"By Mr. Swacker: Exception.

(Question read by the Reporter.)

"A. As I remember it was gasoline.

"Q. Now this is in December, 1913, and you were there during the year 1914? A. 1914.

"Q. You were there during the year of 1915?

"A. Yes, sir.

"Q. And how much longer were you there?

"A. Kiefer?

"Q. Yes. A. To September, 1916.

"Q. To September, 1916? A. Yes, sir.

"Q. Do you know that this same process that you have explained was carried on by them during that entire period? A. Yes.

"Q. I mean by that, that the gasoline was produced there at the plant, that they received the material from the south, blended it with the material there, and then shipped it again to Port Arthur, and they called it gasoline? A. That was the general procedure, yes, sir.

"Mr. Swacker: Our objections and exceptions will apply to these last few questions, also?

"The Court: Yes.

"Mr. Chambers: That is all.

"The Court: Now, it seems to me that this is a duplication of what was admitted yesterday. I understood they admitted that was the practice before and afterwards. They saved their right to strike it out on the ground of being irrelevant and incompetent. That is an admitted fact. That is an admitted fact for the purpose of this case, subject to their objection and exception, on the ground of irrelevancy and incompetency.

"Mr. Chambers: Do I understand that these facts that this witness has testified to are admitted?

"The Court: They have admitted it by other witnesses, the same thing, it comes as an admitted fact for the purpose of this case.

"Mr. Chambers: The only reason this witness was put on was because, as I remember the testimony and the admission, I may be mistaken, they went from the month of May, 1916, up to the present time, and didn't go back of the month of May, 1916. And that was the purpose of putting on this witness, was to show that this transaction had continued during the entire period from the construction of the plant.

"Mr. Swacker: We make a further admission to cover all that. I don't think this particular point has been admitted. We make a complete statement of what we admit subject to our objection. We admit from the inception, in the inception, at the plant in 1913, up until about the end of 1914 or 1915, the practice was to ship naptha from Port Arthur to Kiefer, and there blended and shipped it, not back to Port

Arthur or Fort Worth, but shipped it to northern points, shipped it to market, shipped the blended to northern points to market, and described it as gasoline.

“Mr. Chambers: Also shipped it to Port Arthur?”

“Mr. Swacker: Not at that time, and if you have any grounds——

“Mr. Chambers: I took the testimony of this witness.

“Mr. Swacker: He said he could not speak with accuracy.

“The Court: What is your best recollection?”

“A. I would say we did ship some, that is my best recollection. However, it is a matter of record and could be very easily secured and I did not bill it out and did not know where it went.

“The Court: It is your best recollection some of that commodity was shipped to Port Arthur?”

“A. That is my best recollection.

“Mr. Swacker: I will not extend the admission to that, but continuing the admission from where I left off, that is, up to the year 1914, and the early part of 1915, the material was shipped to northern destinations, such as St. Paul and Minneapolis, and even Canada, and billed as gasoline; that beginning in the early part of 1915, shipments to northern markets described as gasoline, were discontinued altogether, with the exception of shipments to the Shady Side plant at Pittsburgh, which continued throughout the time up to the present, in fact, to be made and described as gasoline, and the balance of the material was all from hence forward shipped to Fort Worth, described as gasoline, to the Ft. Worth refinery, and thereafter starting in 1915, continuing up to December, 1916, all of it except that going to Pittsburgh was shipped to Port Arthur refinery, billed and described as gasoline; that following December 2, 1916, shipments were made of the blended commodity from Kiefer only to Port Arthur, and described as unrefined naphtha and to Shady Side, Pittsburgh, to the Company, the Gulf Company's plant, and described as gasoline in the billing. That is all, of course, subject to our objection and our exception.

“By Mr. Swacker: Does that cover the entire field?”

"By Mr. Chambers: We accept that admission but we are still depending upon this witnesses testimony.

"By the Court: I will not permit you to cover any evidence covered by the admission.

"By Mr. Chambers: I say we are still standing on this witnesses testimony and we accept their admission.

"By Mr. Diggs: If the court please we move to strike from the record that portion of this witnesses testimony which he says it is his best recollection at the time that this product was shipped in 1913 and 1914 back to Port Arthur, because he says—he shows it was not his business to ship and he had no connection with the shipping and no means of knowing.

"By the Court: On what do you base your recollection. First where did you get your information—what were your duties there?

"A. I was loading the cars out and taking the gravity test of it as I remember, after that time we did ship to Port Arthur and I don't remember just where we stopped.

"By the Court: Now in taking the gravity test and loading the cars did you have occasion to see the shipping orders and bills of lading and things like that?

"A. No, that wasn't part of my business.

"By the Court: Did it come under your observation in the discharge of your duties, either directly or indirectly?

"A. Well they may have come under my observation, yes I have seen lots of bills of lading but I couldn't tell you when we stopped shipping north and went back to shipping to Port Arthur, as I say that is a matter of record.

"Q. Have you got those records?

"A. The records are here.

"By the Court: I will let you withdraw this witness and confer with the other side and get the record. Whatever they show, that is better. Of course that is one way of proving a man's best recollection, but it is not a definite recollection. That don't have strong probative effect. If objection is made on the ground it was not the best evidence I will sustain that.

"By Mr. Swacker: Very well we make that now.

"By the Court: I sustain it.

"By Mr. Swacker: We will also admit——

"By Mr. Chambers: I don't know.

"By Mr. Swacker: You only have Kiefer, you haven't touched Drumright and Jenks.

"By Mr. Chambers: How do you know we want that?

"By the Court: Very well. Do you all want to cross examine the witness now?

"By Mr. Swacker: Yes, sir.

"By the Court: I struck the evidence out I don't suppose there is anything to cross examine on.

"By Mr. Swacker: I was going to cross examine him on the grade of the blend. I have not stated that the blend was the same degree of blend.

"By the Court: Did they ask him about the blend?

"By Mr. Swacker: They asked him if it was blended. It isn't established as to whether it was the same character of blend at all that was shipped. That is the blend in 1914 was of the same character of blend that we shipped subsequently. We don't concede it was the same in this admission." (S.M. pp. 564-570.)

XXXII. In admitting the evidence while the witness Hogland was on the stand respecting shipments by the Gypsy Oil Company from Kiefer, Oklahoma, to Shady Side, Pennsylvania; said evidence being as follows:

"By Mr. Chambers: The purpose of this witness is to show the materials shipped from Kiefer was shipped north and south the same as here and from the same tank.

"By Mr. Swacker: We will admit that.

"By Mr. Chambers: One shipment north and the other shipment south? Will you admit during this period that there was a commodity manufactured at Kiefer shipped out of the same tank at Kiefer, one car loaded, designated as gasoline, designated Shady Side, Pennsylvania, and the other designated unrefined naphtha to Port Arthur?

"By Mr. Swacker: We do.

"By Mr. Chambers: At the same time.

"By Mr. Swacker: Yes, sir. Our previous ad-

mission was it was the same material and if it makes it stronger we will say it is out of the same tank at the same time and this not as strong as the other.

"By Mr. Chambers: We have the other admission in. That is all with this witness.

"By Mr. Swacker: Of course this is admitted subject to our objection to the admissibility of the evidence that it is incompetent.

"By the Court: Yes." (S.M. pp. 580, 581.)

XXXIII. In admitting the testimony of the witness Koontz respecting the character of material upon which the doctor test was made, the evidence not showing the witness to be qualified to say: said testimony being as follows:

"The Court: Now, what doctor test did you make, on what commodities?

"Mr. Swacker: I object to his attempting to testify to any particular commodities, as being unqualified.

"The Court: If he knows, he may tell. Do you know what commodities you make a test on, and you may testify, and you can have you exception. Go ahead.

"A. We made the doctor test when specified.

"The Court: Well, propound the question to him.

"Q. Specified by whom? A. The man in charge.

"The Court: Who was usually in charge, what did they call him?

"A. The man over me?

"The Court: Yes.

"A. Chief chemist; the man in charge of the laboratory, in other words.

"The Court: Well, have you got any specific instances you want to ask about? Go ahead.

"Q. Now, isn't it a fact that the doctor test was made rather seldom, on gasoline and naptha?

"Mr. Swacker: I object to that. It is not shown the witness is qualified to know what gasoline and naptha are.

"The Court: If he knows, he may answer, and you may have your exception.

"Mr. Swacker: Now, is it not shown he is qual-

ified in the course of business. May I cross the witness just a minute on this?

"By the Court: If he knows the physical fact I will let you cross examine afterwards and strike it out if it is not competent and relevant.

"By Mr. Payne: Answer the question.

"By the Witness: State the question, please.

"Q. Whether the doctors tests were usually made on gasoline and naptha?

"By the Court: If you know.

"By Mr. Swacker: We object on the grounds stated.

"By the Court: You have your objection and exception.

"By Mr. Swacker: Exception.

"A. I don't know that it was usually made on all stuff. I was only on for eight hours a day.

"By the Court: What did you make it on then, if you know when you were on duty.

"A. Made it on shipments of gasoline going out under specified order when necessary.

"Q. What was the purpose of this doctor test?

"By the Court: If you know.

"By Mr. Swacker: I object to that.

"By the Court: If you know, you say on specified orders when necessary. Now when was it necessary?

"A. When we got the orders." (S.M. pp. 586-588.)

XXXIV. In admitting the evidence while the witness Koontz was on the stand, respecting instructions to laboratory boys to designate the commodity formerly called "Kiefer gasoline" as "unrefined naptha"; said evidence being as follows:

"Q. Is it a fact that instructions were received by you in the laboratory that the oil that had been previously designated as Kiefer gasoline should thereafter be designated as unrefined gasoline?

"The Court: And if so, when?

"A. I cannot remember the date.

"The Court: About when?

"A. I could not say.

"The Court: What year?

"A. I could not say that.

"Mr. Swacker: If any importance is sought to be attached to that--I don't know what the facts are, but we will concede what the government is seeking to prove, that in substance instructions were issued to the laboratory boys to call this unrefined naphtha from the time that the practice to call it unrefined naphtha on the shipping arose. I don't know what the facts are in that respect, but we will concede that; but we deny the relevancy of it, and of course we object to the admissibility of it.

"The Court: Very well.

"Mr. Payne: That is all." (S.M. p 593.)

XXI. In admitting the testimony of the witness, Otey, in substance, that he copied the words "painter's naphtha" from a car slip, said car slip not being in evidence.

XXXVI. In admitting in evidence and permitting to be read and shown to the jury Exhibits Numbers 77, 78 and 66, which exhibits the evidence of Government's witnesses showed to be lead pencil records of the physical characteristics developed by laboratory tests of material received at Port Arthur, which it had been the custom of the testers to designate previous to December 2, 1916, generally as "Kiefer gasoline," sometimes as "Kiefer gas," and sometimes "Kiefer," and thereafter as "unrefined naphtha," the words, "gasoline," and "gas," having been erased from the *entires* formerly reading "Kiefer gasoline," or "Kiefer gas." Because: (a) said entries do not constitute an admission, nor tend to establish any fact, that the material in question was gasoline, the evidence of Government's witnesses showing that it was not the duty, nor within the scope of the employment, of the parties making such entries to classify or describe the material, but that their sole function was to record the physical characteristics developed by the test; (b) the erasures were not admissible for the purpose for which they were offered, of establishing intent at the time when they were admitted, the *corpus delicti* not having been established at such time; and not shown to have been made by, at the instance of, or with the knowledge or consent of any agent of defendant, the scope of whose authority embraced matters affecting freight charges.

XXXVII. In admitting in evidence and permitting to be read and shown to the jury Exhibits Numbers 80, 81, 82, 83 and 84, said exhibits consisting in, 80, a bound file of monthly statements kept at the Port Arthur plant showing car numbers and gallonage of shipments received at Port Arthur from Kiefer, bearing heading unrefined naphtha after May, 1917, and without heading previous thereto; Exhibits 82 and 84 being statements from the files of the general office of defendant at Pittsburgh, Pennsylvania, with Exhibits 81 and 83, the latter being letters of transmittal, showing the same date for the months of April and May, 1917, such statements bearing the heading "Kiefer gasoline," the Government contending that headings had been cut off the Port Arthur statement, Exhibit 80, for purposes of concealment; there being no evidence that headings had been cut off Exhibit 80, nor, if there had in fact been such cut off, why or when it was done: Such evidence not being competent to prove that the material denominated "Kiefer gasoline" was gasoline, and not being admissible at the time for the purpose for which offered, of establishing intent, the *corpus delicti* not having been established at such time; and not shown to have been made by, at the instance of, or with the knowledge or consent of any agent of defendant, the scope of whose authority embraced matters affecting freight charges.

XXXVIII. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 85, 90, 91 and 92, being telegrams exchanged between C. B. Ellis and R. R. Mitchell and W. M. Powers in January, 1914, in relation to rates on gasoline between Kiefer and Port Arthur.

XXXIX. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 86 and 87, being letters exchanged between C. B. Ellis and W. M. Powers in May and June, 1916, in relation to rates on gasoline.

XL. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 88 and 89, being letters exchanged between C. B. Ellis and J. R. Christian and F. G. Reilly in February and March, 1915, respecting rates on naphtha from Port Arthur to Kiefer, and rates on gasoline from Kiefer to Port Arthur.

XXI. In admitting in evidence and permitting to be read to the jury Exhibit No. 93, being a letter from J. R. Christian and F. G. Reilly to C. B. Ellis dated January 15, 1915, in relation to the rate on naptha from Port Arthur to Kiefer.

XLII. In admitting in evidence and permitting to be read to the jury Exhibit No. 94, and admitting the testimony of the witness Timmons in relation thereto.

XLIII. In admitting in evidence and permitting to be read to the jury Exhibit No. 95, and admitting the evidence in relation thereto, showing in substance that during the years 1913 and 1914, at the inception of shipment from the plant at Kiefer, shipments were made and sold commercially of a product described as "blended gasoline."

XLIV. In admitting the testimony of the witness Millard in substance, that prior to December 2, 1916, the Gypsy Oil Company billed shipments as gasoline.

XLV. In admitting the testimony of the witness Millard respecting commercial shipments; said testimony being as follows:

"Q. Mr. Millard, you referred to some gasoline that was marketed direct from Kiefer and shipped from Kiefer to customers did you not? A. Yes, sir.

"Q. How was that billed? A. I believe as gasoline.

"Q. State the difference between that product shipped direct and the product shipped to Port Arthur?

"A. At that time?

"Q. Yes.

"A. The only difference was in the gravity.

"Q. What was the difference?

"A. That I could not tell. The different customers call for different gravities in their orders, and the product was made to meet those orders.

"Q. Now, is it a fact that the gasoline which you shipped direct to the customers, and sold on the market as gasoline, is it a fact that the only difference between that and what you ship to Port Arthur, was that the gasoline marketed direct was blended with more naptha?

"A. I do not remember the exact amount of naptha it was blended with. The only difference was in the gravity.

"Q. How could you control the gravity?

"A. By blending.

"Q. Well, now, suppose, for example, that you had a seventy gravity casinghead gasoline, and wanted to produce a sixty gravity gasoline for the purpose of being marketed direct, how would you accomplish that result?"

"A. By using naphtha.

"Q. By blending the casinghead with naphtha?"

"A. Yes sir.

"Q. Now, suppose you wanted to get the gravity to say fifty-eight, instead of sixty; how would you accomplish that? A. Use more naphtha.

"Q. Add a little more naphtha? A. Yes, sir.

"Q. Now, was there anything else done to the gasoline that was sold direct besides blending it with naphtha?"

"A. No, sir.

"Mr. Swacker: We would like an objection and an exception to all this testimony, on the ground of irrelevancy and immateriality. I just did not want to interrupt him.

"The Court: Very well. You may have your exception to it." (S.M. pp. 700-702.)

XLVI. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 100, 101, and 102, being records of distillation tests between March 31, 1917, and February 1, 1918.

XLVII. In admitting in evidence and permitting to be read to the jury Exhibit No. 120, being a statement compiled by the witness Otey of car numbers and gallons.

XLVIII. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 110 to 119, inclusive, being records of distillation tests from October 14, 1916, to December 3, 1918.

XLIX. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 68 and 69, being letters dated June 2, 1914, and December 29, 1915, respectively, from C. B. Ellis, Traffic Manager of the Gulf Refining Company, to W. P. Donovan, Superintendent of the Gypsy Oil Company, giving directions concerning the routing of shipments from the Gypsy Oil Company to the Gulf Refining Company; said letters in no wise tending to establish that said Ellis was connected with the Gypsy Oil Company, for which purpose they were admitted.

L. In admitting the testimony of the witness Freeman concerning the character of plant operated and material shipped by the Carter Oil Company from Cartereo, as follows:

"Q. What kind of a plant has your company at Cartereo, or rather what kind of a plant did you have in the year 1916, from May on?

"Mr. Diggs: If the court please, can I make the same reservation I did before? I do not want to make objection each time. We don't object to these specifically, but want the right to move to strike hereafter.

"The Court: All right.

"A. A skimming plant." (S.M. p. 807.)

LI. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 135, 136, 137 and 138, being telegrams and letters from C. B. Ellis to W. P. Donovan.

LII. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 120 to 134, inclusive, consisting of pump house records from November 7, 1916, to May, 1918.

LIII. In admitting in evidence and permitting to be read to the jury Exhibits Numbers 10 to 14, inclusive, being unloading records.

LIV. In admitting in evidence and permitting to be read to the jury Exhibit No. 139, being General Order No. 1 of the Director General of Railroads, offered as establishing the adoption by said Director General of Railroads of existing tariffs on file December 29, 1917.

LV. In admitting the testimony of the witness Moss respecting an alleged test and the material used therefor; said testimony being as follows:

"Q. What is the company you are with?

"A. Brady, Swanson & Calley.

"Q. Did you sell some gasoline to a party that came to your plant the night before last about half past nine?

"A. I did not sell any.

"Q. Did the Bureau Inspector and myself and Mr. Gann?

"A. I did not sell any.

"Mr. Swacker: I object, as being irrelevant, incompetent and immaterial.

"The Court: The objection is overruled.

"The Court: Well, did you furnish it to him?

"A. Yes, sir.

"The Court: When was that?

"Mr. Payne: Night before last.

"Q. What kind of gasoline was that?

"The Court: Describe what the commodity was.

"Q. Describe what the commodity was.

"Mr. Swacker: Your honor understands this is no part of the test made jointly.

"The Court: Very well. I am going to let this evidence in of this independent test, and I will let your evidence in of your independent test, stand before the jury.

"A. It was just raw casinghead gas.

*By Mr. Payne.*

"Q. Did you take the gravity of it? A. No, sir.

"Q. Did you see it done? A. Yes.

"Q. What was the gravity? A. I—

"Mr. Swacker: We would like to have the privilege of cross examining the witness on the manner of producing before showing what was accomplished in the test. It is a different class of material—if it is a different class of material, we say it is irrelevant.

*By Mr. Payne.*

"Q. Did you put that gasoline in the automobile?

"A. Yes, sir.

"Q. What make of automobile was it, did you notice?

"A. I never noticed.

"The Court: Hold on. I will let them have the privilege of laying the predicate for their objection.

*Mr. Swacker.*

"Q. Mr. Moss, what character of plant did you operate. What character of casinghead plant did you operate?

"A. High and low stage.

*The Court.*

"Q. Compression or absorption plant?

"A. Compression.

*By Mr. Swacker.*

"Q. Did you have expanders on your plant?

"A. No, sir.

"Q. Do you know what kind of plant the Gypsy has, whether that has expanders on it or not? A. I do not.

"Mr. Swacker: We suggest there is no proper foundation laid to take this testimony in evidence.

"The Court: I will permit it, with the understanding that you are to introduce what the difference is between compression plant with expanders and without expanders.

"Mr. Payne: Allow me to do that?

"The Court: Yes, if you don't do that, I will strike this evidence out. It was admitted yesterday that that didn't make any difference. I will permit it only on the understanding that evidence will be introduced to support that contention and if it is not I will strike it out.

"Mr. Swacker: Yes, sir, I think, of course, before additional evidence is offered, that should be established because it is a necessary predicate.

"The Court: Very well, it is within the power of the court to regulate the evidence. If it is not connected up I will instruct the jury not to consider it.

"Q. What did you state was the gravity of the gasoline? A. Eighty-five.

"Q. Did you see the tank of the automobile drained of the gasoline it already had in it? A. I did.

"Q. And you put the 85 gravity raw gasoline right into the tank? A. Yes, sir.

"Q. And did you see them drive away in the car?

"A. I did.

"Mr. Payne: That is all.

*Cross Examination by Mr. Swacker.*

"Q. Mr. Morris, did you examine the performance by the parties there handling that car to see whether they drained the car completely of the gasoline theretofore in it?

"A. It was drained out of the tank in the rear.

"Q. Well, do you know whether they drained out the reserve tank? A. I do not.

"Q. Then you don't know but that the gasoline in the reserve tank is what propelled the car away, is that correct? A. I do not.

"Q. Do you know whether they drained the gasoline from the carburetor? A. I do not.

"Q. Do you know whether they drained the gasoline from the carburetor? A. I don't know.

"Q. Did you see them drain the gasoline from the carburetor or did you not? A. I did not see them do it.

"Q. Do you know what an expander is, on a compression plant? A. No, sir." (S. M., pp. 1152-1155.)

LVI. In admitting the testimony of the witness Downing respecting his using casinghead gasoline from the Crosby & Gillespie plant to propel his car; said testimony being as follows:

"Q. What is your business?

"A. Casinghead gasoline business.

"Q. How long have you been in that business, Mr. Downing? A. Eight years in Oklahoma.

"Q. How long altogether? A. Ten years.

"Q. What is the material, what product do you produce out there?

"Mr. Swacker: I object; incompetent, irrelevant and immaterial; no showing here that there is any connection with this witness and the transaction involved here.

"The Court: Now, he asked how long he had been in the refinery business.

"Mr. Payne: In the casinghead gasoline business.

"The Court: Whereabouts have you been in business?

"A. Kiefer, Oklahoma.

"Mr. Payne: What is the name of the plant?

"A. Crosby & Gillespie.

"Q. Have you ever used casinghead gasoline in an automobile?

"Mr. Swacker: We object, as being irrelevant, incompetent and immaterial, and no showing what character of casinghead—

"The Court: He can show—

"Mr. Payne: Show first he used it, and then what is the gravity.

"Q. What kind of a plant do you operate?

"Mr. Swacker: We will be here from now until next June, the Government can call 20 or 30 witnesses to state they did, and we can call fifty or a hundred witnesses to state they did not, it is a collateral issue, and—

"The Court: You brought it on yourself.

"Mr. Swacker: Of this particular material——

"The Court: Not of the material shipped, I permitted you to go and show by a witness that they tested a material and it was the character of the material of the Kiefer plant. That is the way I let the evidence in. They did not know of their own knowledge that it was the materials of the Kiefer plant, but they tested it as experts, and knew the character of the material at Kiefer, and I permitted them to testify it was the same material.

"Mr. Swacker: We connected it up by proving by the witnesses who furnished it to them.

"The Court: You showed, though, it was subsequent to this date.

"Mr. Swacker: We have also shown and it is undisputed that one plant will continue to produce the same character of material at a later date that it produced at a previous date, but it is a wholly different proposition.

"The Court: I ruled on that; I will let them see what this is. You are manager of the Cosden plant. How long have you been manager of it? Let's get the predicate.

"A. Seven years, ever since it was built.

"Q. What kind of a plant is it? A. Compression.

"The Court: Are you acquainted with the Gypsy plant there?

"A. Yes, sir.

"The Court: What difference, if any, is there in the make-up of the Crosby & Gillespie plant and the Gypsy plant at Kiefer?

"A. Well, no, I couldn't say, I am not acquainted in that way that I can say. I have never been through the Gypsy plant.

"The Court: Well, is your plant an absorption or compression plant?

"A. Compression.

"The Court: Go ahead.

"Q. Are there expanders in your plant? A. Yes, sir.

"Q. State, Mr. Topping, whether you have used the casinghead gasoline in an automobile?

"Mr. Swacker: To which we object as incompetent.

"The Court: From that plant. From that plant, from that Crosby & Gillespie plant, which is a compression plant? What does it compress?

"A. Gas.

"The Court: Casinghead gas?

"A. Yes, sir.

"The Court: And by compression, converts it into what is known as casinghead gasoline.

"A. Yes, sir.

"The Court: You use the expansion method?

"A. Yes, sir, expansion for cooling.

"The Court: This character of casinghead gasoline that you say you used in cars, where did you get it from?

"Mr. Swacker: He hasn't said he used it. They asked him. You asked a question in which you implied that he said he had used it. He hasn't answered the question.

"The Court: I think the record shows that. Did you use it in a car?

"A. Yes, sir.

"Mr. Swacker: To which we object.

"The Court: I want to see the condition.

"Mr. Swacker: Yes, but we want our exception.

"The Court: I will give you a chance to make your objection and consider it made in time.

"The Court: Go ahead, answer the question, you know how to lay the predicate.

"Mr. Payne: That is what I have been trying to do.

"Q. Did you use the gasoline from that plant?

"The Court: I insist that is not—where did you get the gasoline you say you used in the car?

"A. From Crosby and Gillespie plant.

"The Court: When?

"A. Ever since I built the plant for six years.

"The Court: Go ahead.

"Mr. Payne: That is all.

"The Court: You mean you made it a practice of using casinghead gasoline to operate your car for that six years?

"A. Yes, sir, may have sometimes bought some other gasoline when I was not there.

"The Court: Did you use anything else besides this casinghead gasoline to run your car?

"A. Yes, sir.

"Mr. Swacker: We ask this evidence be stricken out as being irrelevant, incompetent and immaterial and not being shown it is the same character of material at all and the conditions are not shown, surrounding the manufacture, surrounding the particular material used by the witness.

"The Court: I will let the record show that they shipped this very stuff—who does the evidence show they shipped it to.

"Mr. Payne: The Texas Company at Port Arthur, at their plant.

"The Court: Do you know the specific gravity; the range of the specific gravity of this commodity you are talking about here, do you know the maximum and the minimum of it?

"A. I do not.

"The Court: The way I get it from you is that you have run that plant for the past six years, and that plant is used exclusively for abstracting casinghead gasoline from the gas by the compression method?

"A. Yes, sir.

"The Court: You did expand it and make it a practice to use that commodity in running your car?

"A. Yes, sir.

"The Court: Very well, I will let it stand over your objection and give you an exception.

"Mr. Swacker: Yes.

"The Court: I merely asked these question- to get the—

"Mr. Swacker: We object now, with the development, it is specifically shown here it is not the same material he stated in response to the court he didn't know what the gravity was.

"The Court: I admit he shows that practice during the year, and it is for the jury to say what the weight is, to say that during that time it is the highest or lowest gravity. I don't know whether this evidences on this test are admissible until it is unfolded and I hear the arguments on both sides as to

the law. I haven't made up my mind as to its evidentiary weight.

"Mr. Swacker: Give me an exception.

"The Court: Yes." (S.M., pp. 1115A-1161.)

LVII. In admitting the testimony of the witness Dykema respecting the conduct and results of an alleged test of material presumed to have been casinghead gasoline, whereas the evidence showed that the witness did not know and had not examined to ascertain whether the reserve tank or carburetor of the car used, had been drained of real gasoline or not; said testimony being as follows:

"Mr. Payne: Mr. Dykema, did you, in connection with a number of the Bureau of Explosive inspectors, and others, make a trip to Jenks night before last?

"A. I did.

"Q. Will you—

"The Court: Do you know this man Moss who testified here you saw him—

"A. I saw him, sir.

"The Court: Will you state what you want to do, Mr. Payne?

"Mr. Payne: What occurred at Jenks.

"Mr. Swacker: To which we object as incompetent, irrelevant and immaterial.

"The Court: Well, if you get what place you are at I will admit it. Jenks is a very indefinite proposition.

"Q. State what occurred in the plant of the Brady, Swanson & Calley people.

"The Court: If anything did occur.

"Mr. Swacker: To which we object, incompetent, irrelevant and immaterial, having nothing to do with this defendant or the Gypsy Oil Company.

"The Court: Overrule the objection.

"Mr. Swacker: We except.

"A. We went to the plant—

"The Court: Is that the plant where Mr. Moss was?

"A. Yes, sir.

"The Court: Go ahead.

"A. We drained our gasoline tank thoroughly.

"The Court: What do you mean by thoroughly?

"A. We drained the tank which connected, of all, as far as the carburetor, and as far as we could determine, there was no gasoline left.

"The Court: Did you drain the reserve tank?

"A. I don't know if there was a reserve tank on the car or not.

"The Court: Did you look to see, did you clean the carburetor and clean that?

"A. The carburetor drains back to the tank automatically if you open the bottom of the tank.

"The Court: Did you examine to see?

"A. We examined the tank and the gasoline did come out of the hole in the bottom of it.

"Mr. Swacker: May I cross examine him on that?

"The Court: Yes.

*By Mr. Swacker.*

"Q. You say you understand; did you examine to see whether it was in fact drained or look at the carburetor at all? A. We did not.

*By Mr. Payne.*

"Q. To the best of your knowledge and belief, was the car entirely drained of the gasoline that was in it?

"Mr. Swacker: I object, being irrelevant, incompetent and immaterial.

"The Court: Yes, I sustain the objection.

"Q. Go ahead and state what occurred.

"Mr. Swacker: I object, as being irrelevant, incompetent and immaterial.

"The Court: You will have to show there was no gasoline in the car or the carburetor was cleaned, before I will admit the evidence.

"Mr. Payne: We can show even if there had been any in the car left, it would have been used up very quickly.

"The Court: You must do that and lay the predicate before I admit the evidence.

"Q. Mr. Dykema—

"Mr. Payne: They presume something—

"The Court: You can lay the hypothetical question, lay the predicate for the hypothetical question,

prove your predicate. I have ruled and you must follow what the court says, and we will get through.

"Q. State whether or not—what kind of a car was it?

"A. It was a Packard car.

"Q. State whether the running of a Packard car from Jenks to Tulsa would use up all of the gasoline which might have remained in the car had there been a reserve tank, and had there been any gasoline left in the carburetor?

"Mr. Swacker: I object to that as incompetent.

"The Court: I am going to let them prove this, but I will state now, I don't think the weight of this evidence amounts to much.

"Mr. Swacker: Your honor observed the witness says he don't know how much the reserve tank might contain.

"The Court: If you are going to make a test, you must take all manner of precaution to make the test.

"Q. State whether or not, in your opinion, that would use up all the gasoline. A. It would.

"Mr. Swacker: We have an exception.

"The Court: I will let the circumstances go to the jury.

"Q. State what kind of gasoline was put into that car after it was drained of gasoline that was already in it.

"Mr. Swacker: I object to that question, particularly as to the form, because it is already testified by the witness that he don't know whether it was completely drained.

"The Court: That is for the jury. What the attorney says don't make evidence. The jury understands what was done.

"The Witness: Repeat the question, please.

"Q. As to what kind of gasoline was put in the car after it was drained?

"A. The product of the compression of natural gas.

"Q. What was the gravity of it?

"A. It was 85 gravity.

"Q. 85 gravity. Did you take the gravity of it at the plant? A. I did.

"Q. What was the vapor tension of that gasoline?

"A. The vapor tension, as we determined it, was seventeen and one-half pounds.

"Q. Seventeen and one-half pounds.

"Mr. Swacker: I don't want to be insistent, but may it be considered that we have an objection to each question and answer, and the court overrules the objection and we save an exception?"

"Q. After you filled the car with this 85 gravity gasoline—did it start the motor?"

"A. It did start the motor repeatedly.

"Q. Was there any trouble in starting the motor?"

"A. There was none.

"Q. State how far the car ran on that gasoline.

"A. It ran——

"Q. Well, where did it run to?"

"A. Ran back to Tulsa, ten miles, I understand it is about twelve miles.

"Q. Did the car stall at all on the way back?"

"A. No, sir.

"Q. Was there any trouble in the running of the car?"

"A. None that I could determine.

"Q. Was the road hilly or level? A. Quite hilly.

"Q. What was the condition of the road near the Brady, Swanson & Calley plant?"

"A. The road near the plant there was new and very sandy and rutted deeply.

"Q. About what speed did the car make on the way back? A. We made as high as 35 miles an hour.

"Q. Was there any adjustment made on the carburetor, on the car?"

"A. None that couldn't be made on the dash.

"Q. Who drove the car, Mr. Dykema?"

"A. I do not remember the driver's name, I believe Donnelly.

"Q. Was it a hired car? A. Yes, sir.

"Q. Where was it hired?"

"A. At a stand across from the Tulsa Hotel.

"Q. Had you ever seen the car, or the driver, before?"

"A. Not to the best of my knowledge.

"Q. Had you ever been to the plant of Brady, Swanson & Kelley before? A. No, sir, had not.

"Q. Had you ever met Mr. Moss before?"

"A. No, sir.

"Q. What kind of gasoline did you ask him to give you? A. Casinghead gasoline.

"Q. Raw casinghead? A. Raw casinghead." (S.M. pp. 1178-1183.)

LVIII. In admitting the testimony of the witnesses Dykema without his being qualified to have an expert opinion,

concerning his belief as to the possibilities of operating a car with material the character of which was not definitely known; said testimony being as follows:

"Q. Mr. Dykema, state in your opinion whether a material even lighter than the material you used last night would run an automobile? A. It would.

"Mr. Swacker: I object to that as incompetent, irrelevant and immaterial.

"The Court: What was the question.

(Question read.)

"By the Court: Material of what kind?

"Mr. Payne: Of the kind that he used in the Pierce Arrow car last night.

"The Court: I believe I will permit that. Their experts have testified as to what it wouldn't do and so on. The converse is true?

"A. It would.

"Q. How light would the material have to get before it would fail to run a car?

"The Court: What material are you talking about?

"Mr. Payne: The same material, gasoline.

"The Court: The material that you had in that car?

"Mr. Payne: Yes.

"The Court: The commodity you had in that car?

"Mr. Payne: The commodity you had in that car?

"Mr. Swacker: I object as being irrelevant, incompetent and immaterial, unless the proper foundation is made, showing the witness has tried and demonstrated and found what point materials will not run the car.

"The Court: He testified he is an expert and has had experience in casinghead gas and things like that, that is *prima facie* evidence which would entitle him as an expert to testify. I will permit you to cross examine him, if you desire.

"Mr. Swacker: I except.

"The Court: I think the authorities hold the court determines whether a man is an expert.

"Mr. Swacker: Yes, sir, but the question presupposes the knowledge which one could only have by

ascertaining in a profession and it is not ascertained whether he attained that knowledge in a profession.

"The Court: I will permit him to testify.

"Q. Is as to whether material, even lighter than the material you used last night would run an automobile and——

"The Court: An ordinary automobile?

"Q. An ordinary automobile, I mean, ordinary automobile and of the point of likeness——

"The Court: Not a Ford—but I don't say that out of derision of a Ford—but a Buick or Dodge or Pierce Arrow.

"Mr. Chambers: More Fords in use than any other car and probably use more gasoline than any other car.

"The Court: I believe they testified yesterday most anything would run a Ford.

"Mr. Chambers: It makes it of commercial value then.

"The Court: Well, when you determine the name, things like that, and it is offered for the purpose that I think it should be conformed to the name of those that you have mentioned, take at least an average grade to determine it, I will confine it to Buicks, Dodges, and Pierce Arrows or Chandlers, cars of that character.

"Q. Yes, any other standard than a Ford?

"A. I believe any liquid made from natural gas by compression will run an automobile." (S.M. pp. 1188-1190.)

LIX. In admitting the testimony of the witness Dykema not shown to be qualified as possessing knowledge of the character testified to; said testimony being as follows:

"Q. Is it not a fact that the product from the compression of natural gas is what is universally known as gasoline?

"Mr Swacker: I object to this as involving—he supposes that the witness has universal knowledge.

"Mr. Payne: He has.

"The Court: I will let him answer the question, whether it is commonly known, not universally known.

"Mr. Swacker: I think he should be limited in it——

*By Mr. Payne.*

"Q. Is it commonly known as gasoline?

"The Court: You can bring out what he means by commonly known.

"Mr. Swacker: Exception, please.

"Q. Is that liquid commonly known as gasoline?

"A. It is.

"Q. In the trade? A. Yes, sir.

"Q. In the scientific world? A. Yes, sir." (S.M. p. 1206.)

LX. In admitting the evidence of the witness Debar concerning having used casinghead gasoline to propel a car, it not being shown that the material was of the same character as that produced by the Gypsy Oil Company; said evidence being as follows:

"Q. Wouldn't casinghead gasoline run a motor car?

"Mr. Swacker: I object; incompetent, irrelevant and immaterial; doesn't show the particular kind of casinghead gasoline involved.

"Q. Have you used casinghead gasoline in any car?

"A. Yes.

"Q. When and where?

"A. During the investigation of the natural gas situation for preparation before the Corporation Commission I drove a Paige car—

"Mr. Swacker: I object to further testimony, unless it is shown what material came from these plants, and that it is identical.

"The Court: Let's see, and then I will be able to rule on it.

"A. I ran a Paige seven-passenger sedan a great number of miles.

*The Court.*

"Q. What sort of casinghead gasoline did you use?

"A. I will get to that, your honor. I will describe that.

"The Court: Yes.

"A. A part of the time on casinghead compression gasoline and absorption plant, both combined; and in another case, on certain compression casinghead gasoline. At an investigation for the North American Refinery, held at Cushing, I believe three years ago this summer, from some certain compression plants I drove a Ford car

several hundred miles on compression gasoline. Also one of the Cushing plants. And I drove a Dodge roadster with compression casinghead gasoline quite a time, some week or two, in that distance, with nothing but casinghead compression gasoline.

"Mr. Swacker: I ask now that that be stricken out as incompetent, irrelevant and immaterial, not properly identified as being the same material.

"The Court: I will overrule the objection.

"Mr. Swacker: Exception please." (S. M., pp. 1285-1287.)

---

In rejecting evidence offered by the defendant upon said trial, to which defendant duly excepted, in the following instances, to-wit:

LXI. In sustaining the objection of the Government to the questions asked of its witness, Waddell, on cross-examination after having testified that he had collected on defendant's shipments the rate applicable to unrefined naphtha, whereby the defendant sought to show that in the month of July, 1919, upon the witness first attempting to collect rates applicable to gasoline he was enjoined by the United States District Court, at Beaumont, on the petition of defendant; said questions, offer and ruling being as follows:

"Q. Mr. Waddell, you testified that you had collected the unrefined naphtha rate on all shipments shipped by the Gypsy Oil Company to the Gulf Refining Company at Port Arthur since December 2?

"The Court: 1916.

"Q. 1916. Is it a fact, Mr. Waddell, that you did undertake to hold out some of these cars claiming a higher rate than the unrefined naphtha rate?

"Mr. Payne. I object unless he fixes the period your honor. I covered only the period from December 2, 1916, to March 31, 1919, which was the date of the indictment, the period covered by the indictment.

"Mr. Diggs: I will state the question again.

"Q. You did undertake in the year 1919, prior to November 22, 1919, undertake to hold some of these cars on the ground that they were subject to a higher rate?

"The Court: Now, after the railroads were put into the hands of the government, I will require you

to limit that. I believe this indictment goes up to that period.

"Mr. Payne: And beyond. But, your honor, what happened in November, 1919, can have no bearing on this case as the period we cover ends with May 31, 1919, and these gentlemen on the other side have been very particular to limit us to what happened during the period of the indictment itself. It is a well established rule. We have never attempted to show as to what has happened afterwards.

"Mr. Swacker: All these subpoenas duces tecum call for more than two months after the indictment. I understood your honor to rule this morning that you would allow evidence on certain matters up to the return of the indictment but not afterwards.

"The Court: I have ruled that is true.

"By Mr. Diggs: If the court please we can thrash this matter out in a second by stating to the court what I expect to prove and then let him rule on it.

"By Mr. Payne: Subsequent to the period no matter what it is it would not be competent.

"By the Court: I will hear you state what it is.

"By Mr. Diggs: The defendant Gulf Refining Company expects to prove by this witness and now offers such proof that sometime in the month of July, I think July 26th and up to and prior to November 22, 1919, he undertook to refuse to deliver the cars described unrefined naphtha shipped by the Gypsy Oil Company from the plants of said people at Drum-right and Jenks.

"By Mr. Payne: We object to the question as leading.

"By the Court: He has got a right to ask leading questions, this is your witness.

"By Mr. Diggs: To the Gulf Refining Company at Port Arthur and was compelled to deliver said cars to the Gulf Refining Company under said rate by order of the United States District Court at Beaumont in pursuance of an order made in a case in which the Gulf Refining Company was complainant and the Railroad Companies and Walker D. Hines the Director General of the Railroads were defendants.

"By the Court: You need not answer that question. I will sustain the objection.

"By Mr. Diggs: Exception if your honor please.

"By the Court: Alright give him an exception."  
(S.M., pp. 214-215.)

LXII. In sustaining the objection of the Government and rejecting the testimony offered by the defendant on cross-examination of the Government's witness League, by which defendant sought to prove that the witness had received a ruling from the chief inspector of the Bureau for the Safe Transportation of Explosives to the effect that the description used by the Gypsy Company was not incorrect; said questions, offer and ruling being as follows:

"Q. In the course of your duties as an inspector do you know of any controversy arising between yourself and Mr. Donovan the manager of the Gypsy Oil Company over an appropriate description to be used in shipping this product? A. No, sir.

"Q. Do you know of any controversy having arisen between Mr. Donovan and the inspector named Ennis?

"By the Court: Of your own knowledge, not from hearsay?

"A. No, sir.

"Q. Do you know of a controversy between yourself and this inspector Ennis in respect to the mode of description? A. Yes.

"Q. Will you state what that controversy was?

"A. There was an exchange of ideas between—

"By Mr. Payne: I anticipate that this, your honor, is in reference to a conclusion of law and I think that Mr. Swacker should bring out the nature of the controversy first?

"By the Court: Yes, sir.

"By Mr. Swacker: My previous question indicated the nature of the controversy, a controversy as to the proper description to be used on the shipping orders.

"By Mr. Payne: I think that that is triable by the regulations themselves, not what this man or that man or the other many may think about it.

"By the Court: On what theory do you claim that is admissible.

"By Mr. Swacker: We desire to show that such a controversy arose and that it was submitted to the superior officer of both of these inspectors, who ruled

in favor of the interpretation given by the Gypsy Company, and overruled the other inspectors. Now we don't say that that is controlling in any sense of determining what the commodity is, but we do say in the light of the evidence that has already been admitted as to the custom of calling the thing that it is relevant on that score.

"By the Court: I sustain the objection.

"By Mr. Swacker: Particularly on the question of intent. We say that if there was no concealment as has been shown by the shipping order; this witness has testified that it was evidenced always by the shipping orders that the commodity was casinghead, that it certainly negatives any intent to obtain an improper rate.

"The Court: This is not the way to prove it. You want to prove by him that he or any officer of these bureaus advised that this was the proper way to bill it, I will let you prove that.

"Mr. Swacker: I was getting to that. I was asking him what the controversy was.

"The Court: No, that is not it. It don't make any difference whether they had a controversy or not, if there was any officer whose duty it was to advise them told them that was the way to bill it, I will let you prove that.

"Q. Did you ever have any instruction from Colonel Dunn, the head of the Bureau of Explosives, to any question as to how this commodity should be billed?

"The Court: No, not that, but what he told these people. It doesn't matter whether they had any instructions or not, but if they told them that was the way to bill it, I will let you show it. I mean, if any of these inspectors advised the Gypsy that that was the proper way to bill it, I will let you prove that.

"Mr. Swacker: That is not exactly what happened. What happened was this, that this inspector would not be giving instructions to the Gypsy, but he communicated to his chief, and his chief gave him instructions.

"The Court: Well, I will exclude that.

"Mr. Swacker: Exceptions, then.

"The Court: That is not a matter for the jury. That is a matter for me." (S. M., pp. 490-493.)

LXIII. In sustaining the objections of the Government to and rejecting the testimony offered by the defendant through the witness League on cross examination, by which the defendant offered to show that the fact that there was a divergence in nomenclature as between the tariffs and the safe transportation rules respecting the article known as casinghead gasoline, was known to and discussed by a meeting at which said witness was present, attended by a majority of the producers of the locality, the witness having been permitted to testify on his direct examination concerning the name used by employees of such producers as he came in contact with; said questions, offer and ruling being as follows:

"Q. Did you attend a meeting of casinghead producers in the summer of 1918 or the spring of 1918, between the casinghead producers and the Bureau of Explosives, a conference? A. On May 11, 1918.

"Q. Here in Tulsa? A. Yes, sir.

"Q. I will ask you if you can state whether there was a large meeting of casinghead producers present at that meeting? A. Yes, sir.

"Q. I will ask if it involved a large portion of the producers of casinghead in this vicinity, or a large portion of the producers in this vicinity? A. Yes, sir.

"Q. Do you recall whether Mr. Donovan, the manager of the Gypsy Gasoline plant, was at that meeting?

"A. Yes, sir.

"Q. Do you recall whether Mr. C. B. Ellis was at that meeting? A. Yes, sir.

"Q. Do you recall whether any representative of the Texas Company was at that meeting?

"A. I don't recall.

"Q. Do you recall whether Mr. Jarvis was there?

"A. I don't know.

"Q. Who was there on behalf of the bureau?

"A. Of explosives?

"Q. Yes. A. Mr. W. S. Topping, C. P. Bisel.

"Q. Who is Mr. Bisel, connected with the bureau?

"A. The chief chemist.

"Q. Was Colonel Dunn there? A. No, sir.

"Q. Can you tell me what the purpose of that meeting was?

"A. A conference with the producers of casinghead gasoline.

"Q. Well, with respect to the rules proposed to be recommended by the Bureau to the Interstate Commerce Commission? A. Yes, sir.

"Q. I will ask you if you recall a discussion of that portion of rule 1824-K you read a while ago in the first edition reading 'and is shipped as gasoline,' and in the second rule reading 'must be described as gasoline, casinghead gasoline or casinghead naphtha'?"

"Mr. Payne: I object, your honor. I don't think that is legal.

"The Court: I don't see how that would be competent.

"Mr. Swacker: They have attempted to show by this witness what was common terminology.

"The Court: No, just the practice of the companies, how they use it.

"Q. Was there any discussion in that meeting——

"Mr. Payne: We object to any discussion in the meeting. It was in reference to proposing an amended rule. Now, the amended rules themselves are the law and not what the discussion was in reference to putting it in. There may have been all kinds of opinions expressed.

"Mr. Swacker: I am not asking this witness to testify to what the law was. I am asking him to testify the subject of discussion there in so far as it had anything to do with the name of this commodity.

"The Court: I will permit you to show they discussed it but not what they said.

"Mr. Swacker: Very well.

"Q. Was there a discussion there of the name properly to be applied to this commodity? A. Yes, sir.

"Mr. Swacker: I do not want to transgress your honor's ruling in that respect, I ask this question——

"Q. Was objection made there that there was a divergence in nomenclature of this particular article as between the tariffs and the safety transportation rules——

"Mr. Payne: I object to what further transpired at the meeting unless we are going to take up the entire meeting and the government to show things favorable to its side.

"The Court: I permitted them to state what was discussed, but not what was said. That is a collateral matter and hearsay, would have to unfold before the jury everything to see the merit.

"Mr. Swacker: I think that is correct. The only thing—I only think I am entitled to it, because the

witness on direct examination went into this character of testimony as to what people called it.

"Mr. Diggs: I suggest that the only theory on which the evidence of this witness was admitted this morning was for the purpose of showing how the people in this vicinity name this article——

"The Court: No, how the trade, body of men.

"Mr. Diggs: We have shown on these—we have shown all these producers or a majority were present or together discussing the proper name to apply to this article.

"The Court: No, I will not permit that. I sustain the objection of the government.

"Mr. Swacker: I except.

"Mr. Payne: I don't object if you let the Government go into it, if you will do that.

"The Court: No, the Government cannot go into it, and I will not permit him to state what he heard and discussed—what he heard them discuss there.

"Mr. Swacker: I except." (S.M., pp. 494-497.)

LXIV. In rejecting the evidence offered by the defendant upon cross examination of the witness Powers showing the witness had established the rate on unrefined naphtha based on defendant's representation that the commodity to be shipped was a low grade article moving to Port Arthur for finishing; said questions, offer and ruling being as follows:

"Q. Did he make the explanation you have heretofore stated in relation to it?

"A. That it was a low grade article to be shipped and treated and reshipped.

"Q. Yes, sir, to Port Arthur to be further finished.

"A. I understood that was to be done, yes, sir.

"Mr. Swacker: Now, may I ask if he established a rate finally based on those representations?

"The Court: No, I will not permit you to prove that.

"Mr. Swacker: All right. That is all." (S.M., p. 719.)

LXV. In rejecting the evidence offered by defendant upon cross examination of the Government's witness Reilly, whereby defendant sought to show that the witness understood the representations of defendant concerning the material to

be shipped as being the material that was in fact shipped, and was actuated in the establishment of the rates used by such understanding; said questions, offer and ruling being as follows:

"Q. Mr. Reilly, did your knowledge and conception of the term unrefined naptha, extend to the point of knowing whether or not there was embraced within that term, naptha produced either by casinghead compression plants or by a topping plant?

"A. I don't think we could or would take into consideration as to how it was produced.

"Q. The different methods of production?

"A. The different methods of production

"Q. Made no difference to you? A. No, sir.

"Q. It was merely a question of was the product unrefined naptha? A. Yes, sir.

"Q. And what was the main question was—the question whether it was finished or unfinished or what?

"The Court: I don't think that is competent.

"Mr. Swacker: Bearing on the question of the representation.

"The Court: Well, the representations speak for themselves. It is in writing. The representations speak for themselves.

"Mr. Diggs: We offer it, if the court please, for the purpose of explaining the meaning that the terms used in the letters already introduced by the Government carried to the mind of this witness.

"The Court: Well, it is not what he understood. That might be if the Frisco was on trial on a criminal offense; they might show their intent, but they are not on trial here now.

"Mr. Diggs: Give us an exception." (S.M., pp. 731, 732.)

"Q. Did the degree of the finishing or refinement enter into the question of what might be shipped on that description?

"By Mr. Payne: I object, the tariff speaks for itself.

"By the Court: The letter speaks for itself too.

"By Mr. Swacker: I except." (S.M. p. 733.)

LXVI. In excluding, upon the objection of the Government, the evidence offered by the defendant of the statute of

the State of Texas passed in February, 1919, which statute prohibits and makes a criminal offense of the calling or designation, for purposes of sale or transportation, of material including that involved in this case either by the name of gasoline or gasoline in conjunction with any other word or words.

LXVII. In sustaining the Government's objection to and rejecting the evidence offered by the defendant through the witness Schock concerning the feasibility of determining by means of distillation curves whether a material will operate a car; said questions, offer and ruling being as follows:

"Q. Now, you were asked, was not allowed to complete your answer with relation to curves, will you explain why it is necessary for you to know what is the curve of the gasoline before you can tell whether it will run a car?

"A. Because the gasoline that will run a car must be made up of a mixture of continuous, or a mixture of substances which will give a rather continuous curve, as we call it, extending from the lowest to the highest, in order that this mixture, when it is sucked or drawn up with the air, drawn through a carburetor, may partly change to a gas, and the remainder be drawn along, a fine mist, as if we use the mixture of lubricating oils and casinghead gasoline, we could have any gravity we wish, and as we drew, used it in the car, particularly with what we might call wild gas product, as we drew air through there we would get a vapor only and a very little mist, because the lubricating oil would be too heavy to be drawn along, the vapor would be too rich, could be easily too rich because the per cent of vapor and air, the upper limit within which no explosion will occur is very low, and if that per cent is easily exceeded, on the other hand the lubricating oils, it would be drawn along——

"Mr. Payne: I object.

"The Court: Yes, I think that is.

"Mr. Swacker: He is speaking of the curves on gasoline composed of the lubricating oils, just to demonstrate that it can be seen by some of the curves that it is impossible to run a car——

"The Court: I don't understand lubricating oils to be in this case.

"Mr. Swacker: No. He is demonstrating why it is impossible to run a car on certain curves in certain instances.

"The Witness: Your honor, will you allow me to explain?

"The Court: No, I think that is going too far.

"A. Well——

*By Mr. Swacker.*

"Q. Now, then——

"Mr. Diggs: Please note our exception." (S.M. pp. 1013-1015.)

LXVIII. In sustaining the Government's objection to and excluding the testimony offered by defendant through the witness Tabor, qualified as an expert, by which the defendant sought to show that casinghead product was comprehended within the scope of the definition given; which questions, offer and ruling are as follows:

"Q. Now, what does Bacon and Hamor say?

"A. Bacon and Hamor say, Vol. 1, page 129, of the work, 'Naptha distillate' (unrefined naptha) as those fractions which boiled up to 150 degrees C under atmospheric pressure.

"Q. That is the same definition as that given by the government in their publication?

"Mr. Chambers: I object to that as asking for a conclusion of the witness.

"The Court: No that is a conclusion.

"Q. That last definition that you have just read likewise comprehended casinghead product? A. It does.

"Mr. Chambers: We object to that as asking for a conclusion of the witness.

"The Court: Yes, that is a conclusion.

"Mr. Diggs: Give us an exception." (S.M. p. 1109.)

LXIX. In sustaining the Government's objection to and refusing to admit Defendant's Exhibit Number 142 for identification, being a bill of complaint filed by the Texas Company against the Texarkana & Fort Smith Railroad Company et al., in the United States District Court, for the Southern District of Texas, wherein said Texas Company sought to recover from the carriers, upon the ground that it had been overcharged, the difference between the rates applicable to gasoline and those applicable to unrefined naptha, on the ship-

ments made by it as to which the indictment alleges said Texas Company suffered discrimination, and the Government offered proof in support of such allegation that the Texas Company had paid gasoline rates on said shipments; said petition being filed with the other exhibits in this case and marked Exhibit Number 142 for identification; and said offer and ruling being as follows:

"Mr. Diggs: Mark that Defendant's Exhibit 142.

"Mr. Diggs: Defendant offers in evidence certified copies of the bill of complaint of the Texas Company against the Texarkana and Ft. Smith Railroad Company, Walker D. Hines, Director General of Railroads, pending in the District Court of the United States for the Southern District of Texas, Texarkana Division.

"Mr. Payne: I object.

"Mr. Diggs: Seeking to recover——

"The Court: Let me see what it is.

"Mr. Diggs: I have a right to make my offer.

"The Court: Yes, but you offer it and I will see what it is.

"Mr. Diggs: I am objecting to the United States attorney jumping in here, which I submit to the court is neither courteous nor an orderly proceeding.

"The Court: Very well, both of you stop.

"Mr. Payne: And has no bearing——

"The Court: Both of you stop.

"Mr. Diggs: Does the court prohibit me from stating——

"The Court: You are offering this as a certified copy giving the style of the case and number of it and I will see what it is and then you can state your grounds.

"The Court: On what grounds do you offer it?

"Mr. Diggs: The Government introduced evidence in this case in chief, showing certain shipments of cars by this company of these railroad companies, the rates of freight paid——

"Mr. Payne: May I interrupt?

"Mr. Diggs: No.

"The Court: Let him make his statement.

"Mr. Payne: May I interrupt a second?

"The Court: No.

"Mr. Payne: Before he makes it. May I have an opportunity to explain?

"The Court: You will be given an opportunity. Proceed, Mr. Diggs.

"Mr. Diggs: Showing the freight received on the cars, as I understand the purpose of the government in offering the proof and the court admitted it was for the purpose of showing nobody else in that section of the country shipped this article by the name we did and it was unknown but that now we offer this record to show that the specific cars mentioned in that evidence, The Texas Company is now seeking to establish to be unrefined naphtha and recover the excessive rate paid; for the purpose of showing the custom of the country and recognition of the term among shippers and producers of the same commodity.

"The Court: Do you object?

"Mr. Payne: Surely we do.

"The Court: Well, do you object? No, just answer the question.

"Mr. Payne: Yes, sir.

"The Court: The objection is sustained.

"Mr. Diggs: Give us an exception." (S.M. pp. 1111-1113.)

LXX. In sustaining the Government's objection to and excluding from evidence Defendant's Exhibits Numbers 143, 144, 145, 146, 147 and 148 for identification, being a bill of complaint filed July 21, 1919, by the defendant against the Texarkana & Fort Smith Railroad and others, in the United States District Court, for the Eastern District of Texas, wherein defendant showed an attempt on the part of the carriers to assess gasoline rates instead of unrefined naphtha rates upon its shipments, and sought an injunction against such course, together with the further proceedings therein, including the injunction pendente lite issued by said court, the demurrer and answer, affidavits, orders and bond in said proceeding, all of which pleadings are filed with the exhibits herein and marked Exhibits Numbers 143 to 148, inclusive, for identification; said offer and ruling being as follows:

"Mr. Diggs: Mark these Defendant's Exhibits 143-144-145-146-147 and 148, if the court please now in offering this I want to say it was offered as a part of the cross examination of the witness in chief and at that time excluded by the court. We now offer the exhibits 143 to 148 both inclusive, being certified copies of the record in the case of the Gulf Refining Company vs. The Texarkana and Ft. Smith Railroad Company.

"The Court: Let me see that.

"Mr. Diggs: Pending in the District Court of Texas solely for the purpose, solely bearing on the motive of the defendant, that is the only purpose we claim they are admissible for, the bearing on the motive of the defendant.

"Mr. Diggs: It has been suggested to me by other counsel that the word 'motive' is not sufficient, so I offer it for the purpose of proving both motive and intent.

"Mr. Gann: The Government objects.

"The Court: On what ground?

"Mr. Gann: On the ground that it is not relevant to the issues in this case, a matter pending in another jurisdiction.

"The Court: Now, what is the last allegation in the indictment? What is the date?

"Mr. Gann: May 16, 1919.

"Mr. Diggs: None of the cars described in that are included in the indictment, I understand?

"Mr. Gann: This proceeding was instituted on July 24, 1919, after the close of the transaction charged in the indictment.

"Mr. Diggs: It is only offered for the purpose of motive and intent.

"The Court: I can understand how, if a suit was filed, that would be evidence then of the good faith where they brought a suit and set it up, but not afterwards.

"Mr. Green: Your honor, you see this was six months before the indictment was returned. We make the point in that way we could be deprived of our defense, because that occurred long before the indictment and being arbitrarily stopped, the indictment might just as well have gone on.

"Mr. Diggs: May I suggest to the court, the

article was shipped; as long as it was delivered to us, we could show no step to show honesty of intention—

“The Court: I will sustain the objection.

“Mr. Diggs: Give us an exception.

“The Court: Very well.” (S.M. pp. 1113-1115.)

LXXI. In sustaining the objection of the Government to and excluding the evidence offered by defendant, of the provisions of Section 4353 of the Revised Laws of Oklahoma concerning the character of material usable as gasoline; which offer and ruling are as follows:

“Mr. Swacker: We want to ask the court to notice, and we introduce as evidence the Oklahoma statute affecting gasoline. Section 4353 of the laws—the Revised Laws of Oklahoma, 1910.

“The Court: I will permit them to go into the record for the advice of the court, not to the jury.

“Mr. Swacker: Our theory—

“The Court: The court takes judicial knowledge—

“Mr. Swacker: You have admitted a good deal of evidence to show the use of words, and I think that is proper evidence in that class, aside from the legal effect.

“The Court: Any objection?

“Mr. Chambers: We object, incompetent, irrelevant and immaterial.

“The Court: You use the word unrefined naphtha—if you had used that word, I would let it go to the jury. I would like to know—

“Mr. Swacker: Most of the evidence has been used on the word gasoline.

“The Court: I will let the word and the term the way it is used gasoline, benzine, naphtha and other easily inflammable liquids of petroleum shall not be tested as flash tests but said fluids shall be tested as to its specific gravity.

“The Court: I will let that part go in.

“Mr. Swacker: The next succeeding part is what we want particularly.

“The Court: That does not go in. These words are not used—

"Mr. Swacker: It is descriptive of the words just preceding.

"The Court: This does not relate to anything—it might be possible that it might be admissible on cross examination of an expert where he was testifying as to specific gravity. That is the only part I will permit to go to the jury for the present. It may be it can be offered later under such shape as might be admissible.

"Mr. Swacker: We, of course, don't want merely the part that has been read without the whole.

"The Court: Very well, I will admit that much. But if you don't want it admitted without all of it, it is not incumbent on you to insist on a part, but I will not let all of it in, but I will let the part that used those terms go to the jury.

"Mr. Swacker: Then may we offer the whole? If I understand the ruling of the court, you will exclude it then?

"The Court: I will permit you to offer this much, and if you don't want any of it unless all—

"Mr. Swacker: That is correct.

"The Court: Then I exclude it. I understand the Government objects.

"Mr. Payne: Yes, sir, we object to that as not bearing on the question in issue as to whether or not this was gasoline.

"The Court: I will exclude it.

"Mr. Swacker: May we save an exception?

"The Court: Yes." (S.M. pp. 1122-1124.)

LXXII. In sustaining the objection to and rejecting the testimony sought to be elicited by the defendant from the witness Dykema on cross examination, concerning commercial products of an ordinary petroleum refinery; said questions, offer and ruling being as follows:

"Q. Now, are you able to state what are the finished commercial products of an ordinary petroleum refinery?

"Mr. Payne: I object.

"The Court: Why?

"Mr. Payne: Because the witness was limited on his examination in chief to casinghead gasoline and he was not allowed to testify in reference to refineries. This is not proper cross examination.

"The Court: I think that is correct.

"Mr. Swacker: He is testifying here as to what is or is not gasoline.

"The Court: You asked though as to what the other products of a refinery were.

"Mr. Swacker: Yes, sir, but he attempted to cover the whole range of petroleum distillation.

"The Court: You made the objection on that and I held him down to it.

"Mr. Swacker: I would like an exception.

"The Court: Very well." (S. M., p. 1251.)

LXXIII. In sustaining the Government's objection to and rejecting the testimony offered by the defendant upon cross examination of the witness Debarr showing that the State of Oklahoma, through its Corporation Commission, does not include the material shipped to defendant as gasoline with respect to taxation and inspection of gasoline; said questions, offer and ruling being as follows:

"Q. Do you know what is the fact what the Corporation Commission of Oklahoma has done with respect to ruling as to whether or not taxes should be paid on this material as gasoline, whether inspected and taxed for gasoline?

"Mr. Chambers: I object.

"The Court: You need not answer that.

"Mr. Swacker: I think it is perfectly proper to show what the use of a term as provided by law, as being construed by the Corporation Commission.

"The Court: That would involve too many issues, all that would have to be before this court. I exclude it.

"Mr. Swacker: Well, may I ask him if it is not the fact that taxes and inspection is not extended to this material, gasoline taxes and inspection?

"The Court: I will not permit that.

"Mr. Swacker: I would like an exception, please." (S. M., pp. 1290, 1291.)

LXXIV. The court erred in admitting over the objection and exception of the defendant, Government Exhibits Numbers 36 to 42, inclusive, and 45 to 56 inclusive, being copies of tariffs on file with the Interstate Commerce Commission,

insofar as said exhibits purport to show anything other than the rates on gasoline from Kiefer, Jenks and Drumright between December 2, 1916, and December 27, 1917, over the routes named in the indictment.

LXXV. That the court erred in permitting the Government's counsel to make improper statements in the presence of the jury to the effect that defendant was in a conspiracy with others to obtain concessions by misbilling; said statements being as follows:

"Mr. Payne: Here is our theory for your honor's consideration, that the Gypsy Oil Company was practically an accessory before the fact in this concession in that they misbilled the shipment.

"The Court: But you haven't got them charged with a conspiracy to violate the law.

"Mr. Payne: Part of the device whereby the Gulf Refining Company got the concession, and thereby they aided and abetted and were in a joint purpose.

"The Court: To my mind I think it is fundamental that that is not competent. If you have any authorities that deal on it I would be glad to hear you, but to my mind that is fundamentally incompetent.

"Mr. Payne: Volume Sixteen of Cyc under the subject of Evidence and Admissions and under the subject of Conspirators and persons acting together, says that where two or more persons are acting together under a common design, that the admission of one are admissions against the others.

"The Court: Well now let me see that.

"Mr. Diggs: Will the court bear with me a minute? I want to object to statements about conspiracy.

"The Court: Oh, they have a right to do that. We haven't time to take that up. You may have an exception." (S. M., p. 199.)

LXXVI. That the court erred in permitting the Government's counsel to attempt to impeach and discredit its own witness, Timmons, in the following respects:

"Q. Does it go from the steam plant into the treating plant? A. Out into the continuous treaters.

"Q. Then what happens to it next?

"A. On into the storage tanks.

"Q. Is it then ready for market? A. No, sir.

"Q. What do you do with it after that?

"A. It has got to be either blended or further refined as you might say.

"Q. Now hold on don't let's anticipate anything.

"By Mr. Swacker: I object to that he is asking the man and the man is answering him as fairly as he can.

"By the Court: Never mind, go ahead.

"Q. After it has gone through the processes you have mentioned the crude still, the steam still and the agitator, what further is done with it in the way of refining?

"A. Well it might be—just depends on what grade I am running—might be further blended.

"Q. Did you do anything else ordinarily? A. No, sir.

"Q. After it has had those three processes?

"A. No, sir.

"Q. What is the purpose of the blend which you might do?

"A. To meet the specifications transported from one oil to another tank to meet whatever specifications I am required to ship.

"Q. Can those specifications be made from the pumping of one tank to another?

"A. Sometimes, sometimes you have to agitate and sometimes blow the tank to get the sample.

"Q. You take a sample from it? A. Yes, sir.

"Q. Naturally you have to do that, to ascertain the contents of it, but aside from this blend, is there anything other that is done to it before you ship it?

"A. As it is in the tank.

"Q. Yes, sir. A. No, sir.

"The Court: Let's make haste. You are taking up lots of time.

"Q. I notice an entry, 'painters naphtha distillate', what is that?

"Mr. Swacker: I object to that.

"Mr. Payne: I will change that.

"Q. What processes are gone through to get painters naphtha? A. The same processes.

"Q. The same processes as the other. That is to say, the oil is refined in the crude stills, steam stills and agitators, and then it is put in a tank and if it meets certain specifications you call it that. What are the specifications

that enables you to determine whether it is painters naphtha? A. By the gravity and color.

"Q. So that your painters naphtha has been through all of your refining processes? A. Some of it has.

"Q. Some of it has. Well now that is a little bit different from what you testified.

"Mr. Swacker: I object to those kind of statements before the jury. He certainly made no such statements at all.

"The Court: I will let the jury determine.

"Mr. Swacker: I would like an exception. I don't think that is proper examination.

"Mr. Diggs: We now ask the court to instruct the attorney for the Government not to make remarks about the nature of the witness' answers.

"The Court: That is not a proper way to examine a witness. The way is to ask him if he didn't say so and so awhile ago. That is the proper way to examine a witness. Proceed." (S. M., pp. 258-260.)

LXXVII. The court erred in stating in the presence of the jury that defendant was making technical objections, giving the implication that the jury would in consequence be unduly detained upon the case for three months; said objections raised by defendant and said statements of the court being as follows:

"Q. You have the original duplicate?

"A. I have the original duplicate of that shipment covered by the same voucher covering the first car B-73, and there is another one there.

"Mr. Gann: I ask to have this identified as Exhibit 30 and offer the same in evidence.

"Mr. Diggs: To which we object as being irrelevant, incompetent and immaterial, and not shown to be issued by the authority of the Texarkana-Fort Smith Railroad Company or signed by any person on its behalf, merely on its face shows to be an instrument, a copy of another instrument which copy is not signed and the rubber stamp appearing on the face thereof not shown to be made by the authority of the railroad company or any of its agents or employees.

"The Court: Have you got the others—offer them together as one exhibit?

"Mr. Diggs: The court overruled my objection?

"The Court: Yes, objection overruled.

"Mr. Diggs: I except.

"Mr. Gann: I offer exhibits offered in evidence—this exhibit is offered in connection with the draft for \$22,826.87, and draft for \$9,193.10.

"Mr. Diggs: I object to the introduction of the said draft as being irrelevant, incompetent and immaterial, because it does not appear said draft has been paid or the amount thereof received by the Texarkana and Fort Smith Railroad Company or any person authorized by it.

"The Court: The objection is overruled.

"Mr. Diggs: I except.

"Q. The freight charges were paid on that car, were they? A. Yes, sir.

"Q. Take the next car, 3104, have you the original duplicate paid freight bill covering car 3104? A. Yes, sir.

"Q. And also the voucher covering that car?

"A. Yes, sir.

"Mr. Gann: I ask that the exhibits be identified. (Which exhibits were marked for identification as Government Exhibits 31 and 32.)

"The Court: Now why don't you wire and get the auditor of this company and get him here and you will get it in much quicker. If they start in on these technical objections I will keep you here three months, and adjourn this jury over. If you start in that I will do that and get it all in here.

"Mr. Diggs: I object to the court stating in the presence of the jury that they are technical objections that we ought not to make.

"The Court: I didn't say you ought not to make them." (S. M., pp. 349, 350.)

LXXVIII. The court erred in stating in the presence of the jury that he believed the defendant was going to insist on technical rules and that he gave it notice that he would require it to toe the law, and upon counsel for defendant objecting to such statements in the presence of the jury as implying that its objections were not authorized by law, although sustained by the court, the court further stated that the objections were only technical and would delay the court and take up time; said objections and statements being as follows:

"By Mr. Diggs: We object to that part of Plaintiff's Exhibit 34 appearing to be a bill or voucher to the Southwest Texas Commercial National Bank for the reason that the same is not endorsed and the J. H. Wilson, it looks like that is his name and he is not shown to be an officer of the Texas Company or is authorized to draw checks and it appears on its face to be for some department agent and not shown that it ever went through the hands of the bank nor was paid by them and I make the same objection to that part of exhibit 34 marked voucher D-522 on the same grounds. I object to that part of the exhibit, Plaintiff's Exhibit No. 34 bearing the number 584 and purporting to be a draft drawn to the order of J. N. Salter and signed by J. C. Countryman as the handwriting of J. C. Countryman has not been shown and it appears to be his signature by another person who is not shown to have any authority to sign his name to the draft nor is the said J. E. Countryman shown to be an officer of the Railroad Company or the said A. R. Bank by whose name it purports to be signed is an officer of the company or has authority to sign the same and I make the same objection to that part of Plaintiff's Exhibit 34, No. 585 being a like draft signed by the same person and for the further reason there is nothing on the face of the said papers to show they have ever been paid except the rubber stamp purporting to contain the name of the Southwest Commercial Bank said stamp not shown to have been affixed by an officer of the bank or an employee having authority to fix the name thereto.

"The Court: Where did you get this voucher?

"A. I got it from our auditor at Houston, Texas, our department agent, he is our auditor, they are in his files in Houston.

"The Court: Now this voucher here, do you know how the South Texas National Bank, are you conversant with the way they handle vouchers and how they mark them paid?

"A. I am conversant with how all banks handle them, and that is marked in the same way, in the usual way as handled by all organizations of that kind.

"Mr. Diggs: We object and ask to have the answer of the witness excluded as being incompetent, irrelevant and immaterial, and tending to show a general custom to which the defendant is not connected, and not being responsive to the question.

"The Court: Very well; objection is overruled.

"Mr. Diggs: We save our exception.

"The Court: Now tell this jury whether or not that draft has been paid.

"Mr. Diggs: To which we object as incompetent, irrelevant and immaterial, because the witness is not shown to have sufficient knowledge.

"The Court: Very well, state whether or not that draft has been paid.

"Mr. Diggs: We save our exceptions.

"A. I stated with all commercial assurance that that draft has been paid.

"Mr. Diggs: We save our exceptions.

"A. I stated with all commercial assurance that that draft has been paid.

"Mr. Diggs: We object and ask that the answer of the witness be stricken, as incompetent, irrelevant and immaterial, and in his answer he states that with all commercial assurance the draft has been paid.

"The Court: Why do you say with commercial assurance it has been paid?

"A. Because it bears evidence of having passed through the usual channels before it reaches the disbursing officer for the final files.

"Mr. Diggs: We ask that the answer of the witness be excluded on the ground it is incompetent, irrelevant and immaterial, and a conclusion of the witness, the fact on which said conclusion is founded not being stated.

"The Court: Now, I believe they are going to insist on these technical rules. I will require you to send and get those witnesses.

"Mr. Gann: I suggest all these exhibits be withdrawn and we re-enter the proof.

"The Court: Very well.

"Mr. Gann: Mr. Reporter, strike from the record all that testimony about those exhibits.

"The Court: Now I will give notice to the defense that you all had better be ready to toe the law.

"Mr. Diggs: We object to the court making the statement in the presence of the jury to counsel for the defendant which implies that they are making

objections not authorized by law, which objections the court has practically sustained.

"The Court: It might be authorized by law but they might be technical objections that only delay this court and take up time. Now we will not discuss it.

"Mr. Diggs: Give me an exception.

"The Court: Gentlemen, you will not consider what the court says when he is dealing with the lawyers in this case. That is a matter the court will take care of and the jury will not consider it in any way whatever for the present." (S. M., pp. 353-357.)

LXXIX. The court erred in permitting counsel for the Government to state in the presence of the jury that defendant made certain misrepresentations which he stated were contained in a letter but not there in black and white but there just the same; said letter being Exhibit Number 97; said statements and ruling being as follows:

"Mr. Payne: We have no objection to the last letter, but we contend that there were representations that the commodity that was being shipped from Kiefer to Port Arthur was the same commodity as was moving between these other points but the fact was that we can show they were entirely different.

"The Court: Get your witnesses here. That representation—where is that representation?

"Mr. Payne: It is in that letter.

"The Court: In this letter, let me see that.

"Mr. Payne: It is not in there in black and white, but it is in there just the same.

"Mr. Swacker: I desire to except to the statements of counsel for the Government, in the presence of the jury, being argumentative, concerning the construction—

"The Court: He is addressing the court.

"Mr. Swacker: I ask for an exception to the statement of counsel for the Government." (S. M., p. 728.)

LXXX. The court erred in denying defendant's motion to strike from the evidence and withdraw from the consideration of the jury the defendant's admission made subject to its

exception concerning shipments of the Texas Company; said admission and motion being as follows:

"By Mr. Diggs: If the court please if you will give me three or four minutes I think we can save three or four days' time in this case. If the court please as to the character of evidence the shipments of the Texas Company sought to be introduced yesterday under certain conditions we think that evidence is immaterial but as we understand the rule in order to be able to move to exclude that evidence after the close of the Government's case we must save exceptions to it as we go along or make an objection to it reserving the right to strike at the conclusion of the Government's case unless the other facts have been shown to make it relevant and material so to cover that feature of the case I have prepared an admission that we are willing to make with respect to count 36 and 81 of the indictment. (Reading) It is admitted by the defendant that the Texas Company shipped to itself at Port Arthur, Texas, over the route of the Midland Valley railroad, the Kansas City Southern and Texarkana & Fort Smith Railway upon the dates, in the cars, the quantities in each such count alleged casinghead gasoline blended about one-third naphtha described in the shipping orders as gasoline and paid the charges for the transportation thereof from Kiefer, and Jenks, Oklahoma, computed at the rates respectively, 33 cents and 39 cents per each hundred pounds and that the commodity shipped from Kiefer was produced by Crosby and Gillespie Company and that from Jenks by the Totum Gasoline Company, this admission is made subject however to the right to move to strike it and have it stricken from the record in the event the Government does not prove by additional evidence facts sufficient to make this evidence relevant and material.

"The Court: What do you say about that?

"Mr. Chambers: I don't know what he means by that last proposition.

"The Court: They admit that for the purpose of the record subject to their right to strike it out on the ground of relevancy and incompetency.

"Mr. Diggs: After the Government closes its case, if the court thinks it is relevant and material, it stands; if the court doesn't think so, it is stricken.

And I want to add to the record that the admission is made for the purposes of this trial only.

"The Court: Yes." (S. M., pp. 387-389.)

LXXXI. The court erred in denying defendant's motion to strike the record and withdraw from consideration of the jury, made upon the completion of the Government's case, and renewed at the end of the evidence, certain evidence admitted over defendant's objection; said motion and ruling being as follows:

"By Mr. Diggs: The defendant moves to strike from the record the admissions heretofore made by the defendant as to the Gulf Oil Corporation owning the stock of the Gulf Refining Company and the Gypsy Oil Company and the Gulf Pipe Line Company of Oklahoma on the ground and for the reason the Government has not made such admissions relevant and material by introducing evidence showing, or tending to show, the dominance and control of the Gulf Refining Company, the Gypsy Oil Company and the Gulf Pipe Line Company by the Gulf Oil Corporation, or that said companies are run and controlled by the same officers, or that a separate corporate existence and independence of each of said corporation is not maintained. The defendant further moves the court to strike from the record and from the consideration of the jury the evidence introduced by the Government, over the objections of the defendant, showing, or tending to show, the method of doing business by the Gypsy Oil Company at its casinghead gasoline plant and the statement of the employees of the Gypsy Oil Company as to the nature and quality of the articles produced, and the evidence showing, or tending to show, that the articles produced were, at the time referred to, as gasoline, on the ground that the same is irrelevant and immaterial in that they are shown to be the acts and declarations performed and made by third persons not under the guidance or control of this defendant; and that no such dominance or control of the Gypsy Oil Company and its employees, by this defendant, has been shown to make the acts and declarations competent evidence as admissions against this defendant; nor has it been shown said acts were performed and statements made in the presence or hearing of this defendant or any officer or agent of this defendant; or

that same were ever made to the knowledge of this defendant under such circumstances and conditions which would make such acts and statements in the presence or hearing of the agents of this company of this defendant evidence against it, and referring particularly to such statements and declarations shown in the evidence by J. H. Reidman, Walter Millard, C. E. Sweet, Frank Ralph, H. W. Morris, Joseph Manson. The defendant also moves to strike from the record all evidence that the Gypsy Oil Company shipped this product, known as casinghead gasoline, south or north before the second day of December, 1916, and shipped same under the name of gasoline, on the ground that said evidence is irrelevant and immaterial as to the guilt of this defendant; and on the further grounds that it does not appear from the evidence of the Government that the product shipped prior to December 2, 1916, was not lawfully shipped and described as provided by the tariff rules and regulations; and on the further ground that said evidence as to this defendant is hearsay; and on the further ground that said evidence cannot be competent and material against this defendant on the ground and for the reason that the Government has not shown that said shipments were made under like conditions and circumstances and subject to the same regulations and laws as to the shipments made after December 2, 1916, and for the same reason and on the same grounds moves to exclude all evidence of shipments north after December 2, 1916; and all admissions of the defendant that the Gypsy Oil Company shipped such products north and south prior to December 2, 1916, and described same as gasoline as being irrelevant and immaterial on the grounds above stated, and no evidence has been introduced by the Government that would tend to make such admissions relevant and material against this defendant; and on the further ground that said evidence and said admissions do not prove, or tend to prove, against this defendant the nature and quality of the articles shipped and could only become competent, material and relevant if the Government had proved the substance shipped to be gasoline. The defendant moves to strike from the record all evidence relating to the Tribes Gasoline Company, the Ajax Gasoline Company, the Akin Gasoline Company, the Monarch Gasoline Company, the Eagle Gasoline Company, the Motor Fuel Company,

Chestnut and Smith Gasoline Company, Oil States Gasoline Company, I don't know whether the name should be Oil States or All States, the Totem Gasoline Company, Crosby and Gillespie Gasoline Company as to how their plants are operated, the nature of the product produced, how such product was billed and sold, the name under which it was produced and sold, the name by which it was generally called and known among the other employees of said companies at the plants producing the same for the reasons and on the grounds that same is irrelevant and immaterial against this defendant and is hearsay, and is 'res inter alios acta'; and on the further ground that it does not prove such usage as would be binding upon this defendant, it not being shown that such facts came to the knowledge of the defendant or even to the knowledge of the Gypsy Oil Company, the defendant being a Texas corporation and it not being shown that it had any business dealings or connection with any of the companies or persons named; and on the further ground that such evidence does not prove and cannot prove or establish a custom in this, that it is not shown to be the general and cover all persons dealing in the article or to include sellers or buyers as well as the employees in the plants, and in this connection particularly moves to strike the evidence of C. C. Waddell, George Anderson, Charlie McCarroll, W. K. Holmes, James Baxtus Saint in such regard. The defendant moves to strike the admission made by it as to the fact of shipments to the Texas Company set out in counts 36 and 81 of the indictment on the ground that same is irrelevant and immaterial and the Government has introduced no evidence making, or tending to make, the facts admitted in such admission relevant and material evidence against this defendant. The defendant moves to strike the evidence of John F. Haich as to the gasoline plants of the Ajax Gasoline Company, Totem Gasoline Company, Jontil Gasoline Company, Kelly Gasoline Company, Swanson and Black Gasoline Company, Texas Company, Oklahoma Petroleum and Gas Company, All States Gasoline Company and Gypsy Oil Company as evidence in regard to the method of the operation of said plants, the nature of the commodity produced by said plants, names by which it was billed and shipped from said plants and what such commodity was generally called by the

employees of said plants on the ground and for the reason that same is irrelevant and immaterial to any fact at issue in this cause, is hearsay as to this defendant, and being transactions, conversations and declarations by parties not connected with the defendant, and not made in the presence of any of its agents or employees and is not evidence proving or tending to prove, that the nature of the commodity shipped to and received by the Gulf Refining Company set out in the indictment was gasoline, and on the further grounds that it appears the practice of said plants that the bills describing and the articles shipped as gasoline was done under the direction of the superior officers of the witness testifying in accordance with the customers of other persons not shown. The defendant moves to strike the evidence of E. J. League as to the nature of the product inspected by him as evidence as to what the product produced by casinghead gasoline plants in the Oklahoma district is called, and the conversation with Mr. Donovan and Mr. Millard as to the nature of the product produced by the Gypsy Oil Company and what they called the product and also moves to strike Government exhibits Number- 58 and 59, being a report of such witness as to the Gypsy Oil Company product; and also moves to strike that portion of the evidence of said witness relating to the the product of the Franchot plant and how such product was commonly known by the employees in the plant on the ground that same is hearsay, irrelevant and immaterial to any issue in this cause being as to this defendant hearsay and transactions between third parties with whom it is not shown this defendant is in any way connected. The defendant moves to strike the evidence of J. S. Scott as to what the employees at the casinghead gasoline plants in Oklahoma called the products produced by them and how such plants billed and described such products and as to the custom of the employees of such plants calling such products gasoline, on the ground that the same is irrelevant and immaterial 'res inter alios' as to this defendant and not being shown to have come to the knowledge of this defendant and on the ground that such evidence is incompetent to prove the nature of the product shipped to and received by this defendant as set out in the indictment; and on the further ground that the alleged custom or usage attempted to be set forth is not shown

to be known to this defendant; and on the further ground that custom and usage is not competent evidence to prove the nature of the product described in the indictment as being shipped to and received by the defendant on the further grounds that the alleged custom is not shown to be general, to the buyer and the shipping public but is confined to certain localities. The defendant moves to strike the evidence of A. W. Bernhart as to the processes of the Franchot plant on the ground that same is irrelevant and immaterial to prove the nature of the commodity which the indictment charges was shipped to and received by the Gulf Refining Company and the nature of such product cannot be proved or established by the practices, customs, usages, acts or declarations of third persons, and with whom this defendant is in no wise connected. The defendant moves to strike Government Exhibits Nos. 66, 68, 69, 86, 87, 88, 95, 97, 98, 100 to 106 inclusive, and also Government Exhibits Nos. 110 to 117 inclusive, and also Government Exhibits 135, 136, 138, 120 to 134 inclusive, 10, 11, 12, 13 and 14 in the tabulated statement checked by witness Otie No. . . . on the ground that said exhibits are irrelevant and immaterial to any issue in this cause and do not prove or tend to prove that the commodity charged in the indictment to have been shipped to and received by the defendant was gasoline and does not tend to prove or disprove that the commodity described in said indictment was not unrefined naphtha, and on the further grounds it is incompetent to prove the nature of the commodity shipped by declarations or practices of third persons. The defendant moves to strike the evidence of J. W. Freeman as to the nature of the product of the Carter Oil Company, its plant at Carterco and by what terms it was described and spoken of, and billed and shipped as being irrelevant and immaterial as to any issues in this cause and not proving or tending to prove the nature of the commodity charged in the indictment to have been shipped to and received by this defendant, and on the further ground that the nature of such commodity cannot be proved or established by acts or declarations of third parties with whom this defendant is not connected. The defendant moves to strike from the record all evidence as to the operation of casinghead gasoline companies in the manufacture and shipment of the commodities produced

by them; and as to all statements of the employees of said companies; as to the nature, quality and physical characteristics of said commodity produced by them and how said product was called and described by the employees of said companies, or by others in the neighborhood of said companies on the grounds that same are irrelevant and immaterial to any issue in this cause, and on the further grounds that same constitutes transactions between third parties and are hearsay as to this defendant, and on the further ground that same is intended to prove the commission of a crime by the defendants by the declarations of third parties without the knowledge of the defendants by showing such third parties called a certain product by a name designated by them without evidence that the product designated by them was identical in its properties, physical and chemical constituents and attributes, to the commodity which the indictment charges was shipped to and received by the defendant; and on the further grounds that such evidence cannot prove the defendant guilty of the crime charged, being the acts, established usages, customs and practices indulged in by third parties.

"Mr. Diggs: As far as the defendant is concerned, if the court please, we are willing that the court reserve its ruling on this until the close of our case. As the court has intimated he would like to hear argument and the whole matter can be presented more consistently, we believe in one argument.

"The Court: Very well." (S. M., pp. 822-832.)

\* \* \* \* \*

"The Court: Mr. Diggs, you haven't got your exception in to the motion to strike.

"Mr. Diggs: I want to ask the court to rule on it.

"The Court: You may have a separate exception to each paragraph on your motion to strike that was made the other day, as if each of the motions were made separate, and you may have a separate exception as to each part referred to in your motion.

"Mr. Diggs: Very well." (S. M., p. 1310.)

LXXXII. The District Court erred in denying defendant's motion made after the evidence in the case was closed,

to instruct the jury to return a verdict of acquittal, or to dismiss the indictment:

(a) Because the evidence did not substantiate, but contradicted the charge; the evidence was insufficient to sustain the charge and there was no evidence in support of certain material allegations of the indictment.

(b) Because there was a material variance between the proof offered and the charge of the indictment.

(c) Because the evidence disclosed there was a controversy involving the construction of tariffs as to whether or not casinghead gasoline was embraced within the description "gasoline," as published in said tariffs, or, whether it was embraced within the description, "unrefined naphtha," as published in said tariffs, of which character of controversy the court had no jurisdiction, such jurisdiction resting wholly in the Interstate Commerce Commission.

LXXXIII. The District Court erred in charging the jury upon said trial as follows:

"The allegation is that throughout the period covering all of said shipments that there was established according to the Acts of Congress joint rates and charges for the transportation of certain properties, to-wit: gasoline in tank cars, and as in that behalf required by law, had printed, and had filed with the Interstate Commerce Commission of the United States, and had published their joint schedules and tariffs of rates and charges which said schedules and tariffs of rates and charges, throughout said period showed the joint rate on each of said routes herein referred to for the transportation of gasoline in tank cars between said points over said four routes, to-wit: (1) over the St. Louis, San Francisco Railway Company, Kansas City Southern and Texarkana & Fort Smith Railway Companies between Kiefer, Oklahoma, and Port Arthur and West Port Arthur, Texas, herein referred to as route number one; and over the Midland Valley Railway Co., Kansas City Southern Railway Co. and Texarkana & Ft. Smith Railway Company between the same places and herein referred to as route number two; and over the Midland Valley Railroad Co., Kansas City Southern Railway and Texarkana & Fort Smith Railway Company between the point of Jenks, Oklahoma, and Port Arthur Texas, herein referred to as

route number three; and over the Atchison, Topeka & Santa Fe, Gulf Colorado & Santa Fe Railroad and Texarkana & Fort Smith Railway Company between the points of Drumright, Oklahoma, and West Port Arthur, and Port Arthur, Texas, and herein referred to as route number four. The rate for the transportation of gasoline in tank cars, the rate on gasoline as shown by the tariff sheets introduced in evidence from December 2, 1916, to June 24, 1918, from Kiefer, Oklahoma, to West Port Arthur, Routes 1 and 2, was 33 cents. From Jenks, Oklahoma, to West Port Arthur, Texas, over the route alleged in the indictment, and which is designated here as route No. 3 was 39 cents; and from Drumright, Oklahoma, to West Port Arthur, Texas, over the route as alleged in the indictment which is the route herein referred to in these instructions as route No. 4, was forty cents. From June 25, 1918, to July 28, 1918, over said route between said Kiefer and West Port Arthur, 41½ cents; and over said route between Jenks, Oklahoma, and West Port Arthur, Texas, 49 cents; and over said route between Drumright, Oklahoma, and West Port Arthur, Texas, 50 cents, of course this means fifty cents per hundred weight. From July 28, 1918, to May 31, 1919, over said route between Kiefer, Oklahoma, and West Port Arthur, Texas, 37½ cents; and over said route between Jenks, Oklahoma, and West Port Arthur, Texas, 43½ cents; and between Drumright, Oklahoma, and West Port Arthur, Texas, over said route 44½ cents.

Now as to unrefined naphtha, the rate from December 2, 1916, to February 2, 1917, over said route between Kiefer, Oklahoma, and Port Arthur, Texas, 19½ cents; from February 3, 1917, to May 1, 1917, from Kiefer, Oklahoma, to Port Arthur, Texas, over said route 19½ cents; from Jenks, Oklahoma, to Port Arthur, Texas, over said route 19½ cents; from Drumright, Oklahoma, to Port Arthur, Texas, over said route 20½ cents; from June 25, 1918, to July 28, 1918, from Kiefer, Oklahoma, to Port Arthur, Texas, over said route 24½ cents; from Jenks, Oklahoma, to Port Arthur, Texas, over said route 24½ cents; from Drumright, Oklahoma, to Port Arthur, Texas, over said route 25½ cents; from July 29, 1918, to May 31, 1919, from Kiefer, Oklahoma, to Port Arthur, Texas, over said route 24 cents; from Jenks, Oklahoma, to Port Arthur, Texas, over said route 24 cents; and from Drumright Oklahoma, to Port Arthur, Texas, over said route 25 cents."

---

The District Court erred in refusing to give to the jury the instructions requested by the defendant in each of the following instances, to-wit:

LXXXIV.

"No. 2.

"You are instructed that you cannot find the defendant guilty under any count in the indictment unless you believe from the evidence, beyond a reasonable doubt, that the commodity which is charged in the indictment to have been shipped to and received by the defendant, was gasoline, and the fact that you might believe from the evidence that the commodity shipped was, and should have been described as liquified petroleum gas, and that such liquified petroleum gas bore the same traffic charge as gasoline, is wholly immaterial to any of the issues in this case, and is not to be considered by you in arriving at your verdict.

"Refused because covered by general charge—See No. 16. Exception saved. R. L. Williams, Judge." (S.M., p. 1523.)

LXXXV.

"No. 3.

"You are instructed that it is not sufficient for you to believe from the evidence that the commodity charged in the indictment to have been shipped to and received by the defendant might have been more accurately, or more appropriately, described or designated as unfinished naphtha, but in order to find the defendant guilty, you must believe from evidence, beyond a reasonable doubt, that the commodity described in the indictment was, as is in said indictment alleged, gasoline, and also must believe, beyond a reasonable doubt, that said commodity was not unrefined naphtha.

"Given in general charge." (S.M., p. 1523.)

LXXXVI.

"No. 4.

"You are further instructed that in order to find the defendant guilty, it is not sufficient that you believe, beyond a reasonable doubt, that the commodity shipped to and received by the defendant is not unrefined naphtha, but you must further believe from the evidence, beyond a reasonable doubt, that such commodity is, as it is charged in the indictment, to be, gasoline.

"Refused because covered in general charge. R. L. Williams, Judge." (S.M., p. 1524.)

## LXXXVII.

## "No. 5.

"You are further instructed that every concession, rebate or discrimination, no matter how honestly granted, made or received, is unlawful, and honesty of purpose or design does not prevent in a civil action or proceeding brought for that purpose, the recovery of the amount of any concession, rebate or discrimination established, and, in addition thereto, in proper cases penalties may be recovered. But, in order, for any claimed rebate, concession or discrimination to be subject to criminal prosecution, in order to constitute a misdemeanor or crime, the rebate, concession or discrimination must be knowingly granted, made, solicited, requested or received. That is, that the thing granted, made, solicited, or received must, at the time of the granting, making, soliciting or reception have been known to be a concession, discrimination or rebate, and have been granted, made, solicited or received as such, and it is the granting, making, soliciting or receiving of the same with such knowledge, that the law defines and punishes as a crime, and the law permits a resort to the criminal courts for punishment only where the guilty knowledge, purpose or design exists to grant, make, solicit or receive a rebate, concession or discrimination.

"Refused as requested. Exceptions saved. Given as amended by me. Exceptions saved. R. L. Williams, Judge." (S.M., pp. 1524, 1525.)

## LXXXVIII.

## "No. 6.

"You are further instructed that upon the question of intent you are to consider carefully and give great weight to the uncontradicted evidence to the effect that the defendant corporation, previous to the time of its indictment, readily accorded full and complete access to its records and affairs to the Government officials investigating the same; and you should bear in mind that such conduct is not consistent with the wilful knowledge and design to obtain a concession or discrimination contrary to law; and as further bearing upon the question of intent, you should give consideration to the fact that the evidence shows undisputedly that the defendant company, at no time, sought to conceal its course or the character

of the material shipped, but instead, even after it was aware of the fact that its acts were the subject of investigation by the Government, continued in its course, which conduct is inconsistent with a guilty intent.

"Refused, exception saved. R. L. Williams, Judge."  
(S.M., p. 1525.)

## LXXXIX.

"No. 7.

"You are further instructed that the fact that the employees of the casinghead gasoline plants of the Gypsy Oil Company spoke of the commodity produced in said plants as gasoline, and that the officers and employees of other casinghead gasoline plants in the neighborhood of the Gypsy Oil Company's plants and Government inspectors spoke of the product of said casinghead gasoline plants as gasoline, is not evidence that the commodity produced by the Gypsy Oil Company and shipped to and received by the defendant as unrefined naphtha was, in fact, gasoline, such statements not being evidence of the nature and character of the product so produced, shipped and received, but such evidence was admitted solely for the purpose of establishing the intent, if any, on the part of the defendant to receive a concession or discrimination in event that you should determine from the other evidence in the case, beyond a reasonable doubt, that the commodity shipped to and received by the defendant, was, in fact, gasoline, and you must first find from the evidence, beyond a reasonable doubt, that such commodity was gasoline, before you consider the fact that said commodity was described by the employees of such casinghead gasoline plants as gasoline.

"Refused. Exceptions saved. R. L. Williams, Judge." (S.M., pp. 1525. 1526.)

## XC.

"No. 8.

"You are further instructed that even if you find from the evidence, beyond a reasonable doubt, that the material or commodity alleged in the indictment to have been shipped to and received by the defendant was not unrefined naphtha, and if you should further find from the evidence, beyond a reasonable doubt, that such material or commodity is gasoline, it is your duty to return a verdict of not guilty, unless you further find from the evidence, beyond a reasonable doubt, that, at the time the defendant received the concession or discrimination

set out in the indictment, it knew that the commodity shipped to and received by it was not unrefined naphtha, and was gasoline; and you must further find, beyond a reasonable doubt, that the defendant had no reasonable grounds for believing, and did not, in fact, believe such material or commodity to be unrefined naphtha, but at the time of receiving said concession or discrimination believed such material to be gasoline and received such concession or discrimination having such knowledge, and with the purpose and design of procuring the transportation of such commodity at rates less than those lawfully published and filed applicable thereto.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S.M., pp. 1526, 1527.)

## XCI.

"No. 9.

"You are further instructed that unless all twelve of you are convinced, beyond a reasonable doubt, that the material could not properly be designated 'unrefined naphtha,' you cannot convict, but must return a verdict of not guilty.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S.M., p. 1527.)

## XCII.

"No. 10.

"You are further instructed that unless all of you are convinced beyond a reasonable doubt, that the material shipped was actually gasoline, you cannot convict the defendant, and it is your duty to return a verdict of not guilty.

"Refused. R. L. Williams, Judge." (S.M., p. 1528.)

## XCIII.

"No. 11.

"You are further instructed that if you believe that the material shipped may properly be described as either unrefined naphtha or gasoline, you must find the defendant not guilty.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S.M., p. 1528.)

## XCIV.

"No. 12.

"You are further instructed that even though you are convinced, beyond a reasonable doubt, that the material

shipped is actually gasoline, you cannot convict unless you are all convinced, beyond a reasonable doubt, that the defendant knew the material shipped could not properly be described as unrefined naphtha.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S. M., p. 1528.)

XCV.

"No. 14.

"You are instructed that the defendant is not on trial for misbranding or misdescribing the commodity alleged in the indictment to have been shipped to and received by it, but is charged in the indictment with having shipped to and receive by it gasoline, and if you find from the evidence, beyond a reasonable doubt, that the commodity shipped to and received by the defendant was not properly and appropriately described by the name of unrefined naphtha and was not, in fact, unrefined naphtha, still you must find the defendant not guilty unless you further find from the evidence beyond a reasonable doubt, that such commodity was gasoline, and should have been shipped and described as such, and further believe, beyond a reasonable doubt, that defendant knew it to be gasoline, and received the alleged concession, or obtained the alleged discrimination with the intent thereby of procuring the transportation thereof at rates less than those lawfully published and filed applicable thereto; and unless you so believe beyond a reasonable doubt, you must find the defendant not guilty.

"Refused. Exception saved. R. L. Williams, Judge."  
(S.M., pp. 1529, 1530.)

XCVI.

"No. 15.

"You are instructed that before you can find the defendant guilty, you must believe from the evidence, beyond a reasonable doubt, that the commodity shipped to and received by the defendant on the dates set out in the indictment was not unrefined naphtha. You must further believe, beyond a reasonable doubt, that the commodity so shipped to and received by the defendant, as described in the indictment, was gasoline, and you must further find beyond a reasonable doubt that the defendant knew the commodity was gasoline and shipped the same with the intent of thereby procuring a concession or discrimination, and that the said commodity was shipped on the dates and at the times in the indictment set forth, and

received the alleged concession or discrimination, knowing it to be such, and with the purposes and design of thereby procuring the transportation of the commodity described in the indictment at rates less than those lawfully published and filed applicable thereto.

“Refused. Exceptions saved. R. L. Williams, Judge.” (S.M., p. 1530.)

## XCVII.

“No. 16.

“You are further instructed that the sole offense with which the defendant is charged, under the indictment, is in having shipped to and received by it, gasoline at a rate less than the legal rate established for gasoline, and unless you find from the evidence, beyond a reasonable doubt, that the commodity so shipped to and received by the defendant was, in fact, gasoline, it is your duty, and you are instructed to find the defendant not guilty even though you might believe from the evidence that the commodity shipped to and received by the defendant was not unrefined naphtha, but was a commodity which should have been shipped under another name than that of unrefined naphtha, and should have borne a rate equal to the rate lawfully published and filed for the transportation of gasoline.

“Given as a part of general charge. Refused. Except. R. L. Williams, Judge.” (S. M., p. 1531.)

## XCVIII.

“No. 17.

“If you are in doubt whether casinghead gasoline is a product of petroleum oil, you must find the defendant not guilty.

“Refused. Exception saved. R. L. Williams, Judge.” (S.M., p. 1531.)

## XCIX.

“No. 18.

“You are further instructed that unless you believe from the evidence, beyond a reasonable doubt, that the defendant company was not honestly, though mistakenly, of the belief that the material shipped might properly be described as unrefined naphtha, you must find the defendant not guilty; in this connection, you should give great weight to the uncontroverted evidence to the effect that the tariff naming the rate on unrefined naphtha was estab-

lished at the request of the defendant company by the carriers involved upon the defendant company's representations that the product intended to be shipped was an unfinished article, that after publication of said tariff and before its becoming effective, the agent of the defendant company advised the agent of the carriers of the intention of said defendant company to begin shipping its product upon the becoming effective of said tariff under the name of, and at the rate applicable to the description of unrefined naphtha; that the shipping orders of the defendant company covering all the shipments set out in the indictment bore, upon their face, the rubber stamp placed thereon by the defendant company indicating that dome placards had been applied to the cars in conformity with the rules governing the safe transportation of the commodity, which rules required and limited the application of said placards to casinghead gasoline cars; further that said rules governing the safe transportation of explosives provided that the proper tariff name shall be used in describing any commodity subject thereto; that such shipments were subject to regular inspection of agents of the carriers whose duty it was to require that the material shipped be properly described, and to the further circumstance that while the evidence clearly shows that the agents of the carrier were at all times in position to be, and were by the defendant fully informed as to the nature of the commodity shipped, no action was taken by such carriers to question the description adopted by the defendant; in these circumstances, unless you believe, beyond a reasonable doubt, that the carriers deliberately intended to accord to the defendant a concession and discrimination, you must find the defendant not guilty.

"Refused, covered, exception saved. R. L. Williams, Judge." (S.M., pp. 1532, 1533.)

C.

"No. 19.

"You are further instructed that unless you are convinced, beyond a reasonable doubt, by evidence that each of the following circumstances is proved with respect to each count of the indictment, viz.:

"(a) That the shipments therein set forth were made, transported and delivered to the defendant.

"(b) That such shipment was of the weight set forth in each such count;

"(c) That the rates alleged in the indictment as applicable thereto were lawfully published and

filed with the Interstate Commerce Commission of the United States and known to the defendant, or posted at the stations from which such shipments were made;

“(d) That the commodity shipped to the defendant in each of the shipments set forth in each count of the indictment, was, in fact, gasoline;

“(e) That the defendant paid to the carriers transporting such commodity charges for such transportation computed upon rates less than those lawfully published and filed, with full knowledge that such payments were so in fact less.

“(f) That such shipments were made upon the dates and in the cars in each such count alleged;

you must find the defendant not guilty; if you have a reasonable doubt as to the existence of any one of the foregoing facts, you must find the defendant not guilty.

“Refused. Exceptions. R. L. Williams, Judge.” (S.M., pp. 1533, 1534.)

#### CI.

##### “No. 20.

“You are instructed that common carriers may lawfully publish and file special rates applicable to the transportation of particular commodities under particular circumstances lower than those applicable to such commodities under ordinary circumstances, and you must regard the action of the carriers as shown by the evidence, in publishing rates applicable to the transportation of unrefined naphtha, at less than the rates previously applying on gasoline as entirely lawful, and you should draw no inference whatever against the defendant from the fact of its taking advantage of such lawfully published and filed rate on unrefined naphtha, providing you have reasonable ground of belief that that term appropriately comprehends casinghead gasoline blended or unblended, and if you believe such term does appropriately comprehend such commodity, you must find the defendant not guilty.

“Refused. Exceptions saved. Covered by general charge. R. L. Williams, Judge.” (S.M., pp. 1534, 2535.)

#### CII.

##### “No. 21.

“If you are in doubt as to whether the proper name of the commodity shipped *in* gasoline or unrefined naph-

tha, or if you believe that neither of such names is the proper name, but that its proper name is casinghead gasoline, you must find the defendant not guilty; if you believe that the defendant company honestly believed that the commodity shipped could be properly designated as unrefined naphtha, regardless of your own conclusions with respect thereto, you must find the defendant not guilty.

"Refused. Exceptions *served*. R. L. Williams, Judge."  
(S.M., p. 1535.)

"No. 22.

"If you are in doubt whether casinghead gasoline is gasoline you must find the defendant not guilty.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S.M., p. 1535.)

### CIV.

"No. 23.

"The act of any officer or agent of the defendant, which may be imputed to it as evidence of guilt, or considered by you as a circumstance from which guilt can be inferred, must be an act done or performed by such officer or agent within the scope of his employment and must be an act done or performed in knowingly receiving, accepting or obtaining a rebate, concession or discrimination.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S.M., pp. 1535, 1536.)

### CV.

"No. 24.

"Only the act of an agent, officer or employee of the defendant done and performed within the scope of his employment, can be imputed to the defendant for the purpose of establishing its guilt, and then only when knowingly done or performed for the purpose of procuring the commodity to be transported in interstate commerce at a rate less than the lawfully published and filed rate, with the intent, by such agent, officer or employee of the defendant obtaining thereby a rebate, concession or discrimination, and after such rebate, concession or discrimination has been obtained or received, no act of an agent, officer or employee of the defendant can be considered by you in determining the intent and guilty knowledge of the defendant, unless it be the act of the agent, officer or employee within the scope of his employment, who pro-

cured the unlawful transportation alleged and obtained the alleged rebate, concession or discrimination.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S.M., p. 1536.)

CVI.

"No. 25.

"In order to find the defendant guilty as charged in the indictment, you must find from the evidence beyond a reasonable doubt, that defendant procured the commodity named in the indictment to be transported in interstate commerce over the routes named in the indictment, with the knowledge that it was to be so transported at a rate less than the lawfully published and filed rates fixed for such commodity, with the intention of knowingly receiving a rebate, concession or discrimination, which intention must have continued up to and including the time of the reception of such rebate, concession or discrimination; and, unless you so find beyond a reasonable doubt, you must find the defendant not guilty; and, unless the defendant was guilty at the time of receiving the alleged rebate, concession or discrimination it could not become guilty by any subsequent act of its agents, officers or employees, and the fact that some of its books were subsequently changed or altered, is not evidence of guilt on the defendant, unless it appears that such changes or alterations were made by the agent, officer or employee of the company procuring the rebate, concession or discrimination, and you are instructed there is no evidence showing or tending to show such change or alteration was made, authorized or permitted by any such officer, agent or employee.

"Refused. Exception saved. R. L. Williams, Judge."  
(S.M., p. 1537.)

CVII.

"No. 26.

"You are further instructed that certain evidence has been introduced with reference to changes and erasures of the defendant's records. No evidence has been introduced which shows, or tends to show, that any responsible officer or agent of the company authorized or acquiesced in this action, and you will, therefore, disregard any evidence upon this subject.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S.M., p. 1537.)

CVIII.

"No. 27.

"You are instructed that the word, 'refined,' cannot properly be applied to any raw product of nature, but can only be applied to a product whose nature, physical characteristics, or component parts have, in some manner, been altered, changed or added to by the act of man.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S.M., p. 1537.)

CIX.

"No. 28.

"You are instructed that distillation is not, under all circumstances, essential to the art of refining, nor is distillation always applied for the purpose of removing impurities from the material distilled, and is often used, not for the purpose of removing impurities, or making the article distilled more pure, but for the purpose of separating the material into its component parts, or some portion of its component part, for the purpose of further treatment, or for the purpose of mixing, blending or combining the same with like or different materials.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S.M., p. 1538.)

CX.

"No. 30.

"You are instructed that you cannot consider the evidence relating to the Texas Company paying the gasoline rate at all, unless and until you are convinced, beyond a reasonable doubt, that the material shipped was actually gasoline.

"Refused. Exceptions saved. Partially given. R. L. Williams, Judge." (S. M., p. 1538.)

CXI.

"No. 32.

"You are instructed that the blending or weathering of the product of the plants at Kiefer, Drumright and Jenks for purposes of transportation did not make it a refined product.

"Refused. Exceptions saved. R. L. Williams, Judge."  
(S.M., p. 1539.)

CXII.

"No. 33.

"You are instructed that in order to ship the product

of the plants at Kiefer, Drumright and Jenks it was necessary for the defendant to make it conform to the rules and regulations of the Interstate Commerce Commission and that it was entirely proper for this to be done either by weathering or blending the product to such a degree as to make it conform to the said rules and regulations.

"Refused. Exceptions. R. L. Williams, Judge." (S.-M., p. 1539.)

### CXIII.

#### "No. 34.

"You are instructed that the word 'refine' as used in this case means 'to bring an article to a given standard' and may be accomplished either by adding something to it in the proper proportions, or by taking something from it to the proper degree.

"Refused. Exceptions. R. L. Williams, Judge." (S.-M., p. 1539.)

### CXIV.

#### "No. 35.

"You are instructed that you are not authorized to consider as a refining process anything that may have happened to the casinghead gas below the surface of the earth; in other words, the word 'refine' refers to something that man may have done to the article as distinguished from the processes of nature.

"Refused. Exception. R. L. Williams, Judge." (S.-m., pp. 1539, 1540.)

### CXV.

#### "No. 36.

"You are instructed that the term 'blending' as the same has been used in this case is a process of refining. You are further instructed, however, that the blending of the product of the plants at Kiefer, Drumright and Jenks with sufficient heavy naphtha to make it conform to the rules of the Interstate Commerce Commission did not necessarily make it a refined article. An article may have undergone some of the processes of refining and still be unrefined.

"Refused. Exceptions. R. L. Williams, Judge." (S.-M., p. 1540.)

CXVI. The District Court erred in not giving to the jury, upon its request for further instructions respecting the

safe transportation rules, the following, requested by defendant, or any additional, instructions in reference thereto:

First, that said safe transportation regulations were not rate regulations nor classifications controlling description to be used for rate purposes; second, that the fact that defendant used the description "gasoline" upon shipments where there were no unrefined naphtha rates applicable, should not be taken as an admission against defendant that the proper name of the commodity in question was gasoline, the use of such name by defendant being obligatory in such cases in order to comply with said safe transportation regulations; third, that the fact, admitted by the plaintiff, that defendant at all times complied with said regulations in so far as affixing the "dome cover placard" stamp upon its bill of lading, required and permitted only upon shipments containing casinghead product, and from the time said regulations were amended to provide that such product must be designated under the description "gasoline, casinghead gasoline or casinghead naphtha", the defendant at all times showed upon its bills of lading, in addition to the description "unrefined naphtha" the further description "Casinghead naphtha 1824-K", should be taken into consideration by the jury as evidence that the defendant did not conceal from the carriers the actual nature of the commodity shipped by it.

CXVII. The District Court erred in overruling defendant's motion to set aside the verdict as to each and every count of said indictment and to discharge it or grant it a new trial on account of errors of law committed on the trial of said cause, as follows:

First. On the ground and for the reason that the verdict of the jury so rendered against it, is contrary to law and the evidence.

Second. Because said verdict is against the evidence.

Third. Because said verdict is not reasonably supported by the evidence.

Fourth. For errors of law committed by the court on the trial of said cause, in admitting over the objection of the defendant, incompetent, irrelevant and immaterial evidence.

Fifth. For error of law committed on the trial of said cause in permitting evidence that the employees of the Gypsy

Oil Company, Carter Oil Company, Smith & Chestnut Company, and Crosbie & Gillespie Company, and a large number of other companies, spoke of and referred to the products of said plants as gasoline, over the objection of said defendant.

Sixth. For error of law committed by the court on the trial of said cause in permitting the witnesses, E. L. League, Haigh and others, to testify as to the custom of the employees of casinghead producers and superintendents of plants, with which this defendant was in no wise connected, of speaking of and describing the casinghead gasoline produced at said plants, by the name of gasoline, over the objection and exception of this defendant.

Seventh. For error of law committed by the court on the trial of said cause, in permitting evidence of the fact that casinghead producers with whom this defendant was in no wise connected, shipped and described in their shipping orders and bills of lading, the products of their casinghead gasoline plants, as gasoline, over the objection and exception of this defendant.

Eighth. For error of law committed by the court in permitting evidence to be given that casinghead producers shipped their product over routes and between points other than those named in the indictment, as gasoline, in the absence of a showing that the same was shipped under the identical or similar circumstances, or so shipped and described with the knowledge of this defendant, over the objection and exception of this defendant.

Ninth. The court committed error of law in permitting evidence of the practice of superintendents of casinghead gas plants, and the employees of such plants, as to the manner of shipping and describing the products of such plants, it appearing that said shipments were made to points other than those mentioned in the indictment and made to refineries, over the objection and exception of this defendant, for the reason that said evidence is hearsay as to this defendant, being transactions between persons with whom it was in no way connected, same not shown to be known to this defendant, and not to have been shipped under similar circumstances and conditions under which the products shipped by the Gypsy Oil Company

to this defendant were shipped, and not shown to be shipped over routes and between points where there existed a tariff or rate on unrefined naphtha.

Tenth. For error of law committed by the court on the trial of said cause in permitting to be introduced in evidence, to the jury, over the objection and exception of this defendant, Government's Exhibits numbered 66, 67, 68, 69, 77, 78, 79, 86, 87, 88, 95, 98, 100 to 106 inclusive; and also Government Exhibits numbered 110 to 117 inclusive; also Government Exhibits numbered 135, 136 and 138; also Government Exhibits numbered 120 to 134 inclusive; also Government Exhibits 10, 11, 12, 13 and 14, and the tabulated statement checked by witness Otey, numbered . . . ., on the ground that the same were incompetent, irrelevant and immaterial to any issues in this cause.

Eleventh. For error of law committed by the court in overruling the motion of the defendant to strike from the record the evidence that employees of casinghead gasoline plants in Oklahoma, called the product produced by them, gasoline; and the evidence of A. W. Barnhart, J. W. Freeman and other witnesses named and set out in said motion, showing the practice of the superintendents of casinghead plants, and the employees thereof, calling the product of said plants gasoline, to which action of the court the defendant then and there objected and excepted.

Twelfth. For error of law committed by the court on the trial of said cause in permitting the introduction of that portion of the evidence of the government, which was subsequently stricken out on motion of this defendant, for the reason and on the ground that the same is incompetent, irrelevant and immaterial, and the improper admission of such evidence being prejudicial to this defendant, and to the introduction of which evidence this defendant at the time objected and excepted.

Thirteenth. For error of law committed by the court on the trial of said cause in refusing defendant's motion to instruct the jury to bring in a verdict of not guilty, to which action of the court the defendant at the time excepted.

Fourteenth. For error of law committed by the court on the trial of said cause in refusing the motion of defendant to dismiss said cause on the ground of want of jurisdiction of the court to hear and determine the same, and that it appeared from the evidence in the case that there was involved the construction of the tariffs, and that such construction was necessary in order to determine whether casinghead gasoline was included within the meaning of gasoline, as such word was used in the tariffs, the determination of which question is by law vested solely in the Interstate Commerce Commission, to which action of the court the defendant then and there excepted.

Fifteenth. For error of law committed by the court on the trial of said cause in refusing to instruct the jury that a material variance between the allegations of the indictment and the evidence existed, and therefore the jury should bring in a verdict of not guilty on such account, to which action and order of the court the defendant then and there excepted.

Sixteenth. For error of law committed by the court in permitting the introduction of evidence to the effect that there were rates in force after December 28, 1917, governing the transportation of gasoline, whereas there was no showing that such rates had been lawfully published and filed, or adopted by the Director General of Railroads, in accordance with the statute and the orders of the Interstate Commerce Commission affecting such publication, filing and adoption, to which the defendant then and there excepted.

Seventeenth. For error of law committed in the course of said trial by the attorneys for the government, consisting in improper comment in summing up, to the effect that the United States was pecuniarily interested in the outcome of said trial, and in making improper comments upon the wealth of the defendant, and in making improper comments to the effect that the defendant had violated the safe transportation regulations, notwithstanding the judicial admission of the government to the contrary; this defendant not being on trial on a charge of defrauding the United States, or of violating such safe transportation regulations, and such comment being highly prejudicial and calculated to inflame the jury, and such comment having been excepted to by the complainant.

Eighteenth. For error of law committed by the court in instructing the jury that there were lawfully established, published and filed rates governing the transportation of gasoline subsequent to December 28, 1917, the evidence showing no publication, filing or adoption thereof in the manner and form provided by law, to which the defendant was allowed to except.

Nineteenth. For error of law committed by the court in charging the jury that they could look to the rules and regulations governing the safe transportation of explosives and other dangerous articles for the purpose of determining or assisting them in determining, the meaning of the term gasoline, said regulations being no part of, and having nothing to do with, the rate regulations and classification governing freight rates, to which charge of the court, the defendant was, by the court, permitted to save an exception.

Twentieth. For error of law committed by the court in its general charge to the jury, that articles shipped in Interstate Commerce, should be billed and designated by the name which it is generally called, and if such article is generally used in commerce, its commercial name should be given, and that if an article generally used in commerce, its commercial name should be used, that is, the name by which it is used in commerce. If the article is not an article generally used in commerce and has no commercial name, then the jury should look to its manufacturer and look to those who sell and buy it, to see how it is called, the law being that tariffs named freight rates, are to be strictly construed with respect to the proper technical designation of the article.

Twenty-first. For error of law committed by the court in refusing special instructions of the defendant numbered 6, 7, 8, 9, 10, 11, 12, 14, 15, 17, 19, 21, 22, 23, 24, 25, 26, 27, 32, 33, 34, 35 and 36, to which action of the court the defendant then and there did except.

Twenty-second. For error of law committed by the court in refusing to give, as requested, or in substance, special instructions, numbered 2, 5, 13, 16, 18, 20, 29, 30 and 31, to which action of the court the defendant at the time did except.

CXVIII. The District Court erred in overruling defendant's motion in arrest of judgment as to each count of the indictment, upon the following grounds:

1. Because the pretended indictment herein is not a true bill voted by the grand jury in accordance with law, as set forth in defendant's motion to strike the same from the records of the court and its plea in abatement duly filed and forming part of the record herein.

2. Because the matters and things set forth and charged do not constitute an offense against the laws of the United States.

3. Because the averments of each count of said indictment are too general, vague, indefinite and uncertain to inform the defendant of the nature and cause of the accusation against it, or apprise it with such reasonable certainty of the offence with which it is charged or what it may expect to meet on the trial so as to enable it to make its defense.

4. Because the averments of each count of said indictment are so vague, indefinite and uncertain, consisting in the pleader's conclusion as to what constitutes a concession, that the court is unable to say as a matter of law whether the acts of defendant constitute an offense against the United States.

5. Because the admissions of the plaintiff and the uncontroverted evidence show that there is involved a controversy as to the legal construction and application of tariffs, of which character of controversy this court has no jurisdiction.

And as to Counts 36 to 40, inclusive, and 81 to 85, inclusive, because the said counts are bad for duplicity, in that in each of said counts there is attempted to be charged two separate and distinct offenses.

CXIX. The District Court erred in entering final judgment in said cause against the defendant.

WHEREFORE, the defendant prays that the judgment of the District Court against it may be reversed.

JAMES B. DIGGS,

FRANK M. SWACKER,

*Attorneys for Defendant.*

Dated, January 10, 1921.

**Order Allowing Writ of Error and Fixing the Amount of Supersedeas Bond.**

Now on this, the 10th day of January, 1921, at Muskogee, in the Eastern District of Oklahoma, came on to be heard the petition of the defendant, Gulf Refining Company, a corporation, for Writ of Error to the United States Circuit Court of Appeals for the Eighth Circuit, said petition being presented at Muskogee to the undersigned Judge of the United States District Court for the Eastern District of Oklahoma. Said petition also asks that an order be entered fixing the amount of security which said defendant will be required to furnish to supersede said judgment until the final determination of the said Writ of Error and the proceedings thereon, and that it be allowed ten (10) days from this date in which to furnish said security, and that pending the furnishing of said security, that said judgment be stayed and superseded for ten (10) days, and on the furnishing of said security, that said judgment be stayed and superseded during the pendency of such proceedings in error, and said defendant, having filed herewith and submitted its Assignments of Error,

It Is Hereby Ordered, Adjudged and Decreed that said petition for Writ of Error be and the same hereby is, in all things, allowed, and that said Writ issue and that citation thereon issue to the United States citing it to appear in the Circuit Court of Appeals of the United States for the Eighth Circuit, at St. Louis, Missouri, on or before sixty (60) days from the date of said citation to show cause, if any it has, why the errors complained of should not be corrected.

It Is Further Ordered, Adjudged and Decreed that said defendant give security in the sum of One Hundred, Twenty Five Thousand and No./100 Dollars, the same to operate as a supersedeas and cost bond, conditioned as required by law, and to be approved by the Judge of this Court.

It Is Further Ordered, Adjudged and Decreed that the defendant have ten (10) days from this date in which to give said security and that the judgment and sentence of this court be, and the same hereby is stayed and superseded during said ten (10) days, and on the giving of said security and the approval thereof, as herein provided, said judgment and sentence of this court shall be and hereby is stayed and superseded until the final determination of said Writ of Error, and

the proceedings thereon be had in the United States Circuit Court of Appeals for the Eighth Circuit.

R. L. WILLIAMS,

Judge of the United States District Court  
for the Eastern District of Oklahoma.

Endorsed: Filed in open court Jan. 10, 1921. W. V. McClure, Clerk U. S. District Court, Eastern District of Oklahoma.

---

**Writ of Error.**

United States of America, ss.

The President of the United States of America, to the Honorable Judge of the United States District Court of the Eastern District of Oklahoma. Greeting:

Because, in the records and in the proceedings, as also in the rendition of the judgment of a plea which is in the said United States District Court of the Eastern District of Oklahoma, before you, at the January Term, 1921, thereof, between the United States of America, who was plaintiff in the said cause, and the Gulf Refining Company, a corporation, who was defendant in said cause, a manifest error hath happened, to the great damage of the said Gulf Refining Company, defendant, as by its complaint appears.

We being willing that error, if any hath been, should be duly corrected, and full and speedy justice done to the parties aforesaid in this behalf, do command you, if judgment be therein given, that then, under your seal, distinctly and openly, you send the record and proceedings aforesaid, with all things concerning the same, to the United States Circuit Court of Appeals for the Eighth Circuit, together with this writ, so that you have the said record and proceedings aforesaid at the City of St. Louis, Missouri, and filed in the office of the Clerk of the United States Circuit Court of Appeals, for the Eighth Circuit, on or before the 11th day of March, 1921, to the end that the record and proceedings aforesaid being inspected, the United States Circuit Court of Appeals may cause further to be done therein to correct that error, what of right, and according to the laws and customs of the United States, should be done.

Witness, the Honorable EDWARD D. WHITE, Chief Justice of the United States, this the 10th day of January in the year of our Lord one thousand nine hundred twenty-one.

Issued at office in Muskogee with the seal of the United States District Court of the Eastern District of Oklahoma and dated as aforesaid.

W. V. McCLURE,

Clerk of the United States District Court  
of the Eastern District of Oklahoma.

(Seal)

By WARREN BUTZ, Deputy.

Allowed by me this 10th day of January, 1921.

R. L. WILLIAMS,

Judge of the United States District Court  
of the Eastern District of Oklahoma.

In the United States District Court of the Eastern District of Oklahoma. United States of America, Plaintiff, vs. Gulf Refining Company, a Corporation, Defendant.—No. 3716 Criminal.

### RETURN TO WRIT.

United States of America, Eastern District of Oklahoma—ss:

In obedience to the command of the within writ, I herewith transmit to the United States Circuit Court of Appeals, a duly certified transcript of the record and proceedings in the within entitled cause, with all things concerning the same.

In Witness Whereof, I hereto subscribe my name and affix the seal of the United States District Court of the Eastern District of Oklahoma.

W. V. McCLURE,

Clerk of the United States District Court  
of the Eastern District of Oklahoma.

(Seal)

By WARREN BUTZ, Deputy.

Endorsed: Filed in open court, Jan. 10, 1921. W. V. McClure, Clerk U. S. District Court, Eastern District of Oklahoma.

### Citation.

United States of America, to United States of America,  
Greeting:

You are hereby cited and admonished to be and appear in the United States Circuit Court of Appeals for the Eighth Circuit, at the City of St. Louis, Missouri, sixty (60) days from and after the date this citation bears date, pursuant to a Writ of Error filed in the Clerk's office of the United States

District Court of the Eastern District of Oklahoma, wherein the Gulf Refining Company is plaintiff in error, and you are defendant in error, to show cause, if any there be, why the judgment rendered against the said Gulf Refining Company, plaintiff in error, as in said Writ of Error mentioned, should not be corrected, and why speedy justice should not be done the parties in that behalf.

Witness the Honorable ROBERT L. WILLIAMS, Judge of the United States District Court of the Eastern District of Oklahoma, this 10th day of January, A. D. 1921.

R. L. WILLIAMS,

Judge of the United States District Court  
of the Eastern District of Oklahoma.

Service of this citation accepted this the 10th day of January, A. D. 1921.

C. W. MILLER,

United States District Attorney for  
the Eastern District of Oklahoma.

J. STANLEY PAYNE,

Special Assistant to the United  
States Attorney.

---

**Supersedeas and Appearance Bond.**

Know All Men by These Presents:

That we, Gulf Refining Company, as principal, and American Surety Company of New York as surety, are held and firmly bound unto the United States of America in the full and just sum of One Hundred Twenty-five Thousand and no/100 Dollars (\$125,000.00), to be paid to the United States of America, to which payment well and truly to be made we bind ourselves, our heirs, executors and administrators jointly and severally by these presents.

Sealed with our seals and dated this 12th day of January, in the year of our Lord, One Thousand Nine Hundred Twenty One.

Whereas, lately at the January Term, A. D. 1921, of the District Court of the United States for the Eastern District of Oklahoma, in a suit depending in said Court between the United States of America, plaintiff, and Gulf Refining Company, defendant, a judgment and sentence was rendered against the said Gulf Refining Company, and the said Gulf

Refining Company has obtained a writ of error from the United States Circuit Court of Appeals for the Eighth Circuit, to reverse the judgment and sentence in the aforesaid suit, and a citation directed to the said United States of America, citing and admonishing the United States of America to be and appear in the United States Circuit Court of Appeals for the Eighth Circuit, at the City of St. Louis, Missouri, sixty days from and after the date of said citation, which citation has been duly served.

Now the condition of the above obligation is such that if the said Gulf Refining Company shall appear either in person or by attorney in the United States Circuit Court of Appeals for the Eighth Circuit on such day or days as may be appointed for the hearing of said cause in said Court and prosecute its said writ of error and shall abide by and obey all orders made by the United States Circuit Court of Appeals for the Eighth Circuit in said cause, and shall surrender himself in execution of the judgment and sentence appealed from as said Court may direct, if the judgment and sentence against it shall be affirmed or the writ of error or appeal is dismissed; and if he shall appear for trial in the District Court of the United States for the Eastern District of Oklahoma on such day or days as may be appointed for a retrial by said District Court and abide by and obey all orders made by said Court provided the judgment and sentence against him shall be reversed by the United States Circuit Court of Appeals for the Eighth Circuit; then the above obligation to be void, otherwise to remain in full force, virtue and effect.

Gulf Refining Company,  
By JAMES B. DIGGS, Its Attorney.  
American Surety Company of  
of New York,  
By HARRY C. ASHBY, Atty. in fact.  
By W. LYLE DICKEY, Countersigner.

Approved:

R. L. WILLIAMS,  
Judge of the United States District Court  
for the Eastern District of Oklahoma.

Endorsed: Filed Jan. 13, 1921. W. V. McClure, Clerk  
U. S. District Court, Eastern District of Oklahoma.

And, to-wit, on the 5th day of February, A. D. 1921, the defendant filed application for enlargement of time in which to file transcript, which application was granted by the court.

Said application and order enlarging time are in words and figures as follows:

**Application for Enlargement of Time to File Transcript.**

To the Honorable ROBERT L WILLIAMS, Judge of the United States District Court for the Eastern District of Oklahoma:

Comes now the defendant, Gulf Refining Company, in the above entitled cause and shows to this Honorable Court that heretofore, to-wit, on the 10th day of January, 1921, final judgment was entered in said cause, and on said 10th day of January, 1921, the Honorable ROBERT L. WILLIAMS, as Judge of said Court did allow a writ of error in said cause returnable to the Circuit Court of Appeals of the Eighth Circuit of the United States, and on said 10th day of January, 1921, a citation was duly issued on said writ of error to the United States of America returnable within sixty (60) days from the date thereof, to-wit, on or before the 11th day of March, 1921: that under the rules of the said Circuit Court of Appeals a transcript of the record in said cause must be filed in said court on or before the 11th day of March, 1921.

The defendant shows and represents that the record in said cause will cover between twenty-five hundred and twenty-seven hundred printed pages, many of such pages being tabulated statements of figures and reproduction of certain rules and regulations of the Departments of the United States introduced in evidence, containing plats and drawings that are both difficult and which take considerable time for making; that the clerk of the court has given said record to Guyette & Humphry of Muskogee, Oklahoma, for printing and that it will be impossible, in the judgment of this defendant and in the judgment of said printers, to have said record printed in time for filing in the United States Circuit Court of Appeals for the Eighth Circuit on or before the return day of said writ of error, and a citation issued thereon, and that it will take about ninety (90) days in addition to said time to print said record and file the same in the United States Circuit Court of Appeals for the Eighth Circuit.

Defendant further shows that it has exercised diligence in endeavoring to procure the printing of said record in time for filing in said Circuit Court of Appeals on or before the 11th day of March, 1921, and before final judgment was entered in the cause; that it has caused the Clerk of said Court to deliver the indictments, motions, pleas to the indictments and the orders of the court on such pleas and motions to Guyette & Humphry, the printers above mentioned, for the

purpose of having the same printed in order to expedite the printing of said record, and that said indictments, pleas, etc., and so much of the record as was then obtainable was delivered to said Guyette & Humphry and set up in type for printing and printed before the final judgment entered herein, and that the Clerk delivered to said Guyette & Humphry the Bill of Exceptions and all papers in connection with the suing out and granting of the writ of error the day after said Bill of Exceptions was delivered by the Judge of the Court to the Clerk of said United [ ] District Court.

Defendant further shows and represents that this application is not made for the purpose of delay, but because it is necessary to procure an enlargement of time for the filing of said return in order that justice may be done, and that said application is made at this time instead of at a later date for the reason that it understands that the Honorable ROBERT L. WILLIAMS, Judge of this Court will leave the State of Oklahoma on or between the 8th and 10th days of February, 1921, and will not return thereto until on, about or after the 10th day of March, 1921.

Wherefore, defendant prays that it be granted an enlargement of time in which to print and file the record in the above styled case in the United States Circuit Court of Appeals of the Eighth Circuit and that your honor make and enter an order in said cause extending the time for filing said record in said Circuit Court of Appeals to the 10th day of June, 1921.

JAMES B. DIGGS,

Attorney for Defendant, Gulf Refining Company.

Endorsed: Filed Feb. 5, 1921. W. V. McClure, Clerk  
U. S. District Court, Eastern District of Oklahoma.

---

#### **Order Enlarging Time.**

It is this day ordered, for cause appearing, that the time in which the defendant in the above entitled cause, Gulf Refining Company, may lodge its writ of error, bill of exceptions and transcript in the above entitled cause in the United States Circuit Court of Appeals of the Eighth Circuit be and the same hereby is enlarged and extended for ninety (90) days from and after the 11th day of March, 1921, to-wit, up to and including the 10th day of June, 1921.

R. L. WILLIAMS,

Judge of the United States District Court  
for the Eastern District of Oklahoma.

Endorsed: Filed Feb. 5, 1921. W. V. McClure, Clerk  
U. S. District Court, Eastern District of Oklahoma.

---

And, to-wit, on the 17th day of February, A. D. 1921, the defendant filed its praecipe for printing record, which is in words and figures as follows:

**Praecipe for Printing Transcript.**

To the Clerk of the United States District Court of the Eastern District of Oklahoma:

In the above entitled cause, you will please have printed the following as the record in the cause:

1. Indictment.
2. Plea in Abatement.
3. Motion to Strike Indictment from Record.
4. Demurrer to Plea in Abatement.
5. Demurrer to Indictment.
6. Motion for New Trial.
7. Motion in Arrest of Judgment.
8. Journal Entries, including Final Judgment.
9. Bill of Exceptions.
10. Petition for Writ of Error.
11. Assignments of Error.
12. Order Allowing Writ and to act as Supersedeas.
13. Writ.
14. Citation.
15. Certificate of Clerk.
16. Supersedeas Bond.
17. Petition for Extension of Time.
18. Order Extending Time.

JAMES B. DIGGS,

Attorney for Gulf Refining Company.

---

Service of the above and foregoing accepted this the 14th day of February, 1921.

C. W. MILLER,

United States District Attorney,  
Eastern District of Oklahoma.

Endorsed: Filed Feb. 17, 1921. W. V. McClure, Clerk  
U. S. District Court, Eastern District of Oklahoma.

---

And, to-wit, on the 7th day of May, A. D. 1921, the defendant filed praecipe for additional papers to be included in the printed transcript, which is in words and figures as follows:

**Praeceptum for Additional Papers.**

To the Clerk of the United States District Court:

In addition to the papers mentioned in former praecipe for preparing record on appeal, you will include in the record the following:

1. Order sustaining motion to strike plea in abatement.
2. Order sustaining motion to strike motion to quash.
3. Order overruling demurrer.
4. Arraignment and plea.
5. Record of trial.
6. Verdict.
7. Motion to set aside verdict.
8. Motion to transfer.
9. Order granting motion to transfer.
10. This notice and agreement as to contents of printed transcript.
11. Certificate of clerk.

JAMES B. DIGGS,

Attorney for Gulf Refining Company.

Notice of the above and foregoing is accepted this 7th day of May, 1921, and I hereby agree that the above and foregoing may be included in the record in the above case as a part thereof the same and to the same extent as if included in the original stipulation herein covering record.

JOHN T. HARLEY,

United States District Attorney for  
the Eastern District of Oklahoma.

By C. C. LYDICK, Assistant.

Endorsed: Filed May 7, 1921. W. V. McClure, Clerk  
U. S. District Court, Eastern District of Oklahoma.

And, to-wit, on the 21st day of May, A. D. 1921, the defendant made application for additional time in which to lodge record on appeal, which was allowed by the court. Said application and order allowing same are in words and figures as follows:

**Application for Additional Time to File Record.**

The Honorable ROBERT L. WILLIAMS, Judge of the United States District Court for the Eastern District of Oklahoma:

Comes now the Gulf Refining Company, the defendant in the above entitled cause, and shows that it has heretofore se-

cured an enlargement of time for the filing of the record in the above case in the office of the Clerk of the Circuit Court of Appeals of the Eighth Circuit, and that such time expires on June 10, 1921, but that it is informed by the printers to whom the Clerk of the United States District Court gave the preparation and printing of the record in said cause that owing to the printers' strike and trouble raised with their force and the likelihood of greater trouble to come, it will be impossible to complete the printing of the record in time to be filed on June 10, 1921, and that such printers, Guyette & Humphry, of Muskogee, Oklahoma, feel uncertain whether said printing can be completed within sixty (60) days from the 10th day of June, 1921, and said printers have advised the attorney of defendant to such effect and requested him to make this application for extension of time; that this defendant has done everything it could do to expedite the printing of the record in the above case and does not make this application for delay, but because the same is necessary in order to preserve the rights of this defendant and see justice done, and that it is solely owing to labor troubles that it is necessary to make this application.

Wherefore, defendant asks that the time for filing said record in the Circuit Court of Appeals for the Eighth Circuit be extended to and including the 10th day of August, 1921.

JAMES B. DIGGS,

Attorney for Defendant, Gulf Refining Company.

Subscribed and sworn to before me this 20th day of May, 1921. (Seal) Ruth M. Connery, Notary Public.  
My commission expires June 10th, 1924.

Endorsed: Filed in open court May 21, 1921. W. V. McClure, Clerk U. S. District Court, Eastern District of Oklahoma.

---

#### **Order Extending Time to Lodge Record.**

It is this day ordered, for cause appearing, that the time in which the defendant in the above entitled cause, Gulf Refining Company, may lodge its writ of error, bill of exceptions and transcript in the above entitled cause in the United States Circuit Court of Appeals of the Eighth Circuit be and the same is hereby enlarged and extended to and including the 10th day of August, 1921.

R. L. WILLIAMS,

Judge of the United States District Court  
for the Eastern District of Oklahoma.

Endorsed: Filed in open court, May 21, 1921. W. V. McClure, Clerk U. S. District Court, Eastern District of Oklahoma.

---

**Certificate of Clerk.**

*United States of America, Eastern District of Oklahoma—ss.*

I, W. V. McClure, Clerk of the United States District Court for the Eastern District of Oklahoma, do hereby certify that the above and foregoing is a full, true and correct transcript of so much of the record in the case of *United States of America v. Gulf Refining Company, a Corporation*, Criminal No. 3716, as was ordered by praecipe of counsel herein to be prepared and authenticated, as the same appears from the records in my office.

I further certify that the writ of error and citation attached hereto, and returned herewith, are the original writ of error and citation issued in this cause.

*In testimony whereof*, I have hereunto set my hand and affixed the seal of said court at my office in the City of Muskogee, this *12* day of July, A. D. 1921.

(Seal)

W. V. McCLURE, Clerk.

By *Warren Butz* Deputy.

1677 And thereafter the following proceedings were had in said cause in the Circuit Court of Appeals, viz:

*Appearance of Mr. R. L. Batts as counsel for plaintiff in error.*

1679 *Order of submission.* May term, 1922, Monday, May 1, 1922.

This cause having been called for hearing in its regular order, argument was commenced by Mr. R. L. Batts for plaintiff in error, continued by Mr. William D. Riter, Assistant Attorney General, for defendant in error, and concluded by Mr. Frank M. Swacker for plaintiff in error.

Thereupon, this cause was submitted to the court on the transcript of the record from said district court and the briefs of counsel filed herein.

1680

*Opinion.*

United States Circuit Court of Appeals, Eighth Circuit.

No. 5899.—September Term, A. D. 1922.

GULF REFINING COMPANY, A CORPORATION,  
plaintiff in error,

*vs.*

UNITED STATES OF AMERICA, DEFENDANT IN  
error.

In error to the District Court of the United States for the Eastern District of Oklahoma.

Mr. R. L. Batts and Mr. Frank M. Swacker (Mr. James B. Diggs, was with them on the brief), for plaintiff in error.

Mr. William D. Riter, Assistant Attorney General (Mr. James M. Beck, Solicitor General of the United States, was with him on the brief), for defendant in error.

Before Lewis and Kenyon, Circuit Judges, and Johnson, District Judge.

LEWIS, Circuit Judge, delivered the opinion of the court.

The plaintiff in error (defendant below) was convicted and fined on 99 counts of an indictment charging that it received concessions on shipments of gasoline to its refinery at Port Arthur, Texas, from Kiefer, Drumright and Jenks, Oklahoma, in violation of section 1 of the act of February 19, 1903 (32 Stat. 847), as amended by the act of June 29, 1906 (34 Stat. 587). The shipments were all made By the Gypsy Oil Company between December 2, 1916, and the early part of 1919; but the freight charges were paid by defendant, and it alleged that they were under the lawful rate, the contention being that the difference in amount between the rate on gasoline and what was paid (rate on unrefined naptha) con-

stituted a concession. Prior and subsequent to December 2, 1916, the tariff gave a rate to Port Arthur of 33 cents per 100 on gasoline in tank cars, but on that date a rate regularly established of 19½ cents per 100 on unrefined naptha in tank cars became effective and continued throughout the time covered by all shipments in controversy. There were, then, the two rates between points of origin and destination, one on gasoline in tank cars, the other on unrefined naptha in tank cars, both listed in the tariff under the general heading: "Oils." Prior to December 2 shipments were made at the rate on gasoline, and the commodity was so designated by the shipper, thereafter the same commodity was shipped to Port Arthur at the rate on unrefined naptha, and the commodity so designated. The indictment charges that the commodity shipped was in each instance gasoline; hence, the burden was on the prosecution to establish that the commodity was gasoline—not unrefined naptha. When the trial opened it was stipulated, among other things:

"Throughout the aforesaid period (covering the shipments), and prior thereto the Gulf Oil Corporation was a corporation organized and existing under the laws of the State of New Jersey; that the Gypsy Oil Company was a corporation under the laws of the State of Oklahoma; that the Gulf Refining Company was a corporation organized and existing under the laws of the State of Texas; that the Gulf Pipe Line Company was a corporation organized and existing under the laws of the State of Texas; and during said period all of the capital stock of the Gypsy Oil Company, Gulf Refining Company and the Gulf Pipe Line Company was owned and controlled by the Gulf Oil Corporation, except that the directors of each of the three last mentioned companies held shares in each of said companies sufficient to qualify them as directors."

We gather from the record that the Gulf Oil Corporation has its main office and conducts its principal business at Pittsburgh, Pa., that the Gulf Refining Company owns and operates an oil refining plant at Port Arthur, that the Gulf Pipe Line Company is a carrying company owning a pipe line from the Oklahoma oil fields to the defendant's refinery at Port Arthur, through which crude oil 1682 is carried to the refinery, and that the Gypsy Oil Company owns and operates at Kiefer, Drumright and Jenks what are known as casing-head compression plants, into which natural gas is conducted and its alleged gasoline contents extracted in liquid form by condensation under compression.

The evidence shows that when crude oil reached the refinery at Port Arthur it is put through the distilling process. As heat is applied the competent parts known as the lighter ends vaporize first, and all of them, down to what is called the kerosene cut, when taken off and condensed into liquid form, are technically and commercially known by the generic name of naptha, which embodies gasoline, benzine and naptha. By further distillation those three may be separated, coming off in vapor in the order named for condensation, the naptha part being then designated as heavy, crude or painter's

naptha. A part of this crude or painter's naptha is shipped in tank cars to the compression plants at Kiefer and Drumright. Their product, if exposed, will again become gaseous. Its vapor tension is more than ten pounds to the square inch, and there are restrictions by the Interstate Commerce Commission on its shipment on account of its dangerous character. One of the witnesses testified that if it were shipped and the dome of the tank car in which it was contained were removed at the end of the route it would all escape in the air. The crude or painter's naptha having a gravity around 54, which the defendant shipped to the casing-head compression plants, was for the purpose of mixing or blending with the product of those plants, which served two purposes: the blending reduced the vapor tension, and when that was brought below ten pounds the restrictions on shipment were not so severe, and secondly, the naptha acted as a sponge to the casing-head condensate (commonly known as casing-head gasoline) and prevented to a great extent evaporation. The blending at the two plants was in the ratio of 30 to 35% naptha to 65 to 70% casing-head gasoline. At the Jenks plant another method was pursued. Instead of blending the casing-head gasoline with the naptha the casing-head was exposed and permitted to evaporate until its most volatile parts had escaped; it was then steamed and the vapor tension thus reduced below ten pounds. This was the commodity—blended from two plants and weathered from the other—shipped under the "unrefined naptha" rate, but which the indictment charges to be gasoline.

4  
1683 Prior to December 2, 1916, the condensates of the three plants and the blended commodity of the two plants were commonly known to and spoken of as gasoline by those employed at the plants. While shipments from the three plants were moving to Port Arthur after December 2 as unrefined naptha, the same commodity was shipped from those plants to the Gulf Oil Corporation at Pittsburgh as gasoline. There was no rate on unrefined naptha to that point. The gravity of casing-head gasoline was around 85, but the blended and weathered commodities had an average gravity of 76. Gravity is said to express the ratio of densities of oil and water at given temperatures. In the oil industry it is of some weight but not a controlling guide to determine the gasoline content, or whether the particular product is gasoline. There are many specifications for that purpose in which there are slight differences, those for aeroplane gasoline, fighting gasoline for bombing planes, gasoline that meets the different tests of different States, etc. All of them give an approximate overpoint, that is, the degree of heat when vaporization begins, and the degree of heat known as the dry point, when vaporization is complete. The uniform requirement is the per cent of recovery. The distillates must equal 95% or more of the gasoline put through the still on a test. Out of 100 gallons at least 95 gallons must be recovered. The highest recovery gotten from the blended and weathered products shipped to Port Arthur was 88%, and it went as low as 76%. Crude naptha is a part of the oil off the crude

X

oil as far down as the kerosene cut. The first thing that the defendant does at its refinery is to put the oil in the crude still, and naptha therefrom is the first cut. It is then pumped away to tanks and agitators, and is given a sulphuric acid treatment to remove the impurities. It is known as the naptha fraction and contains gasoline, benzine and naptha. It then goes to the steaming still for the purpose of making various cuts of it. Gasoline is the lightest of the three and comes over first, benzine the intermediate, and naptha the remainder and heaviest cut. Naptha applies to all of them as a body. After the division into gasoline, benzine and naptha the gasoline is given further treatment, and if it does not meet specifications it is necessary to blend it with other refinery products of lower or higher volatility, and sometimes with both. None of the commodity received from

Oklahoma and here in question was ever shipped out from 1684 defendant's refinery in the condition in which it was received.

It was testified that that would be criminally negligent, that it was not fit to be put on the market, too volatile and dangerous, that it had to be refined when it got to Port Arthur by further blending with the still products. A very high gravity gasoline is made at the refinery in the distillation of crude oil, which also is never shipped as gasoline because dangerous, and because it would not meet any specifications for gasoline, and this is always used at the refinery for blending with the commodity that comes from Oklahoma. The commodity as finally treated and blended at Port Arthur and shipped from there to the market as gasoline contains not more than 25% and as low as 5% of what was received from Oklahoma, shipped as unrefined naptha. The remaining 75 to 95% consists of refinery gasoline and painter's naptha, obtained through distillation from the crude oil at Port Arthur. The blending process frequently has to be done the second time. Distillation tests must be made to meet specifications. Compressed air is turned into the tank for thorough mixing, so as to get the distillation tests accurately. The unrefined naptha shipped from Oklahoma has various names among employees at the refinery, such as Kiefer gas, and others. Employees and managers of other casing-head compression plants in Oklahoma testified over defendant's objection as to the products of their plants, that they blended with naptha in various proportions and shipped out the blended commodities to points other than Port Arthur as gasoline, and that one plant shipped its blend to the Texas Company at Port Arthur as gasoline. At some of them the blends ran as high as 75% of naptha, some 50%. There was great diversity in the character and quantity of the material used in blending among the casing-head producers, some used naptha, some kerosene, some fuel oil. The blending would run from 25% to 95% of material other than the casing-head gasoline, and would then be shipped out from these other plants as gasoline. Some of them did not blend but "weathered" (exposed so the lighter ends evaporated) their product below ten pounds pressure, and then shipped the residue as gasoline. Of the blended commodity at Kiefer there was shipped out of the same

X tank one car designated as gasoline, destined to the Gulf Oil Corporation at Pittsburgh, Pa., and another designated as unrefined naphtha to the defendant at Port Arthur. /The defendant's traffic

agent originally asked the carriers for a transit rate on gasoline; that is, he represented that the commodity was to be moved from Oklahoma points to Port Arthur for further handling. He said he wished to move a quantity of low grade naphtha at Port Arthur to Oklahoma points, work it through the plants there, and move it back to Port Arthur and rework it again before it could be put on the market. There was an arrangement of that kind in Toledo, Findlay, and Lima, Ohio. That request was not granted by the carriers. He then asked that they publish a rate on unfinished naphtha from Oklahoma points to Port Arthur. In that connection the railroads considered the decision of the Interstate Commerce Commission in *National Refining Company v. M. K. & T. Ry. Co. et al.* (23 I. C. C. 527), decided May 7, 1912, in which reparation was awarded. The shipments were from Oklahoma points to the complainant's refinery at Coffeyville, Kansas. The carrier charged the rate on refined oil. The commission, in awarding reparation, said that the product seemed to have no distinct commercial designation or trade name, that complainant referred to it as "crude product"; one of the shippers described it in bills of lading as "crude benzine." It was obtained from the crude oil by a skimming process, by which the lighter ends of the oil were extracted and the residue marketed as fuel oil. The skimming process was accomplished by distillation carried just far enough to separate the lighter from the heavier oil, the former amounting to about one-fourth part. The commission held that inasmuch as there was no trade name or commercial designation for the commodity, that they would leave its description to the carrier in the new rate. Attention of the carriers was also called to the fact that one of the connecting carriers had made a rate from Oklahoma points to Baton Rouge on a commodity obtained from crude oil in the same way as in the *National Refining Company* case, designated as unrefined naphtha. The defendant's agent in the light of the foregoing facts asked for a rate on "unfinished naphtha," but the carriers made a rate on the commodity under consideration as "unrefined naphtha." It was testified that the commodity that moved to Baton Rouge was from a skimming plant, and that the naphtha fractions down to kerosene, called the tops off of crude oil, were shipped to Baton Rouge. It and the commodity that went to Coffeyville had no substantial difference from the commodity now under consideration, except they contained no casing-head gasoline. It was shown, and the fact emphasized by the prosecution, that some of the Gulf Refining Company records which showed the receipt of the commodity at Port Arthur in the early part of 1917 described it as "Kiefer gasoline," and that the word gasoline in many instances had been erased and that the books were in that condition when they were presented to the grand jury. It was not shown who kept the books, nor who made the erasures. It was

also shown that the heading on a number of pages listing shipments of the commodity from Oklahoma to Pittsburgh had been cut off, but that letters written to the Pittsburgh office in connection therewith referred to some of the shipments as Kiefer gasoline. These erasures and changes were characterized as admissions and introduced as such. None of the blended or weathered commodity was ever marketed by defendant in the condition in which it was received, as gasoline or otherwise; samples of it were taken and tested on receipt as guides to proper blending with refinery products in making gasoline, losses were much less in the blending process than in distillation at the refinery and the cost was less, and when that could be done it was the method adopted. In rare instances the distillation process had to be used, but that was unusually on account of the fact of the company being in straightened circumstances for certain material, and occasionally a car would be badly off color. Blending is the general practice not only as to the making of gasoline but kerosene, lubricating and other oils. A refinery could not be economically conducted without blending, and it is the general practice at refineries. Not over ten or twelve per cent of the casing-head condensate entered into the final blend at the refinery of the finished gasoline product that was shipped out as such. It ran as low as 5%. It was shipped to Port Arthur to blend with other material. The process is carried on under the direction of skilful men and requires years of experience.

Mr. Taber, vice president of the Gulf Oil Corporation and a resident of Pittsburgh, had been in the petroleum business constantly since 1882. He started the Gypsy Company's compression plant at Kiefer, and had been in general supervision of it ever since. He had read extensively all treatises and literature that could be had on the oil industry. He had originated and given names to many petroleum products. He read critically on request Bacon and Hamor's book entitled, "American Petroleum Industry" before its publication. It is considered a standard work on the subject and is widely used.

He had also revised the manuscript of another text book on 1687 the subject, limited to the refining practice. He had just recently reviewed the manuscript of a book by Hamor and Padgett on the "Evolution of Petroleum and Natural Gas." He had written a good many technical papers on the subject and was a member of societies interested in the study of the petroleum industry. From the beginning it was customary to call the condensed portion of the vapor down to that used for making kerosene or lamp oil, naphtha. That is the generic name applied to the whole product that comes over above the kerosene cut. The U. S. Census Report for 1885 stated that from 100 bbls. of crude oil 15 bbls. of naphtha could be made, and that out of the 15 bbls. about a half-barrel was made into gasoline, the remainder of the 15 bbls. was called naphtha. But later automobiles came so fast and there was such a demand for gasoline that it was necessary to go to the naphtha to get something heavier. It was necessary to make the carburetors so they would

burn the heavy material, and finally the whole naptha product was utilized and prepared and called gasoline. The demand became so great that some kerosene was put in it, and again the carburetors were changed to burn heavier and heavier material, but they still called it gasoline. The automobile business has run away with the petroleum business. People in the crude oil business attempted to keep up with the automobile requirements. In distillation the parts that come off first down to kerosene are called naptha fractions; that is the generic or family name for them. At present gasoline is known as a combination of products of naptha produced from crude oil and made suitable for use in the general run of automobiles which use suction carburetors; not material that will run one make of car but many makes of cars equipped with the ordinary suction carburetor. He was familiar with the product at Kiefer, Drumright and Jenks, does not consider it gasoline but naptha. It will not fulfil any specifications for gasoline; it requires refining to fit it for the market. The Gypsy Company, when it started in business, attempted to market its product direct to customers in the northwest and failed. All sorts of blends with casing-head gasoline are made. Some blend with kerosene, some with heavy naptha. In order to make a gasoline it is necessary to make a different blend than the one used at Drumright and Kiefer. If weathered enough it could be used to run a car, but that process would take off about 70% of it. It might have to be weathered to less than 30% to run a car satisfactorily.

1688 The weathering made at Jenks and the blending at Kiefer and Drumright was to prevent excessive evaporation and reduce vapor tension. It has too much light end. In the refinery business anything which improves the quality of the oil or petroleum produced and fits it for market is considered refining. Blending is a refining process. Casing-head gasoline has too much light end for safety and for use economically. There is excessive loss by evaporation. In the ordinary specification for gasoline you must get back 95% of what you start with. From the unrefined naptha shipped from Kiefer, Drumright and Jenks you would not get back over 88% possibly 80%. Under the specifications of the U. S. Government if you do not have 95% of what you started with it is rejected and refused. You have to make the product comply with that requirement, and the only way to do it is to take off the light end. Different States require different specifications which have to be met. Unrefined naptha is a proper designation for the commodity in question.

Col. Burrell, holds degree of chemical engineer from Ohio University and doctor of science from Wesleyan University; was in the employ of the U. S. Bureau of Mines from 1906 to 1916; 1917 was with the U. S. Army, in charge of chemical warfare service, research division, which had to do with the development of all sorts of gases, etc. There were about 1,500 technical men in the division, and he was at the head. He first discovered the method of finding the real composition of casing-head natural gas. It was known to be a mix-

ture of paraffin hydrocarbons, but it was not known what they were and in what quantities. He has written various publications, bulletins, magazine articles, and technical papers on gasoline, also wrote a book on the subject; belongs to a number of societies engaged in technical research; is familiar with the literature on the subject; is engaged in the operation of an experimental refinery; has built several refineries. He considers blending a refining process, requiring skill and experience to perform it. Many casing-head plants started compression about 1912. Until the art of blending casing-head gasoline with heavier refinery distillates was perfected the product was almost a drug on the market. That made a tremendous amount of natural-gas gasoline available for use as automobile fuel. Naphtha is the light distillate which comes off from crude oil down to the kerosene cut. It is a generic name. He defines gasoline as

an inflammable liquid, a mixture of hydrocarbons suitable for use in any kind of vaporizers. There is a great deal of confusion in the nomenclature of the petroleum industry. The material shipped from Kiefer, Drumright, and Jenks is not gasoline, although it is popularly called gasoline. The name unrefined naphtha is a proper and appropriate description of the material. Gasoline is a wrong name for it. It would be just as appropriate to apply it to the topping or skimming plant material (shipped to Baton Rouge) described by the Carter Oil man. Casing-head gasoline is not usable in an automobile; it is too volatile and vaporizes too rapidly, and there is great loss on distillation. Most gasolines would not lose over 2 to 2½% on distillation test.

Dr. Garner, mechanical engineer, Pittsburgh; of recent years engaged principally in reference to natural-gas gasoline recovery; has university degree; now in Mellon Institute of Industrial Research at Pittsburgh. Gasoline in the strict sense is that low boiling portion of naphtha having a gravity from 76 to 82 and usable for the purpose of illumination. It is also used as a term applicable to products of petroleum to be used for vaporization purposes. It is a product of the naphtha fractions of crude oil. Used as a commercial term or article of commerce, it is not considered gasoline unless it can be used for vaporization purposes, such as running a car or gasoline stove. The product shipped from Kiefer, Drumright, and Jenks to Port Arthur is not gasoline in any proper sense of that word. Unrefined naphtha describes that commodity very accurately. About 96% of all the material used and called gasoline is used in internal-combustion engines with suction carburetors. Practically all of them are blended.

Dr. Schock, chairman School of Chemistry and Mechanical Engineering, University of Texas. In defining gasoline we must consider its use and take that as the basis for a definition. It is most used in the ordinary automobile. It is primarily obtained from petroleum. What we use to-day and call gasoline is not identical with the material that was called gasoline years ago; it was more volatile than the present gasoline. It is a liquid, volatile, inflammable, but

so made up, and is a mixture of a number of substances in such proportions, that a part only will volatilize when air is blown through it, as is done in the ordinary automobile carburetor. The amount

thus changed to strict gaseous form must not be very large. 1690 There is a degree of interchangeability between the words "gasoline" and "naptha," but it is a little one-sided. All gasoline can be called naptha; that is, it is a product of naptha. The word "gasoline" designates the naptha of certain properties, whereas the word "naptha" designates any volatile inflammable liquid hydrocarbon mixture. He was familiar with the product shipped from Kiefer, Drumright, and Jenks to Port Arthur; it is not gasoline; it is appropriately described as unrefined naptha. The words "unrefined naptha" would also embrace such material as a topping or skimming plant produces. A material that will begin to distill at least as low as 140 deg. F., that will distill 20% at least at 221, that will distill 45% at 275, and that will distill at least 90% at 356, and dry point not exceeding 428, and a minimum recovery of 95%, will run a car. The initial boiling point might be as low as 100. Gasoline that will run a car must be made up with a mixture of substances which will give a rather continuous course, extending from the lowest to the highest, in order that the mixture, when it is sucked or drawn through a carburetor, may partly change to a gas and the remainder be drawn along in a fine mist. By using a mixture of lubricating oils and casing-head gasoline any gravity may be obtained, and as it is used in the car, drawn through air, we would get vapor only and a very light mist because the lubricating oil would be too heavy to be drawn along. Gravity is not a guide.

Witness Miller, a petroleum refiner and consulting engineer, for a while manager of the refining department of Cosden & Co., handled millions of gallons of casing-head products from compression plants; is familiar with still-gas produced by the distilling process at refineries. If it is not condensed into a liquid by the compression or other process, as may be done, it escapes into the air; if condensed it is to a certain extent analogous to casing-head gasoline. It is not a finished product, it must be blended or weathered. Is familiar with the material shipped from Kiefer, Drumright and Jenks to Port Arthur; it is not suitable for gasoline and he does not consider it gasoline. Gasoline is that fraction of crude petroleum lying within the range of boiling points and other necessary points which will satisfactorily and economically operate an internal combustion motor. This material will not do that; it must be blended with products of crude oil in such proportions as to bring the material to the point

where it will operate an internal combustion motor satisfactorily and economically, and blending is the most economical method of bringing it to that point. It can be done by excessive weathering or by distillation, but the weathering required for that purpose would result in a loss of 60 to 75% of the original amount. The percentage of casing-head in the final blending should be kept down to 3 to 5% of the total mixture, according to his ex-

perience, both with Pierce Oil Company and Cosden refinery. There are few refineries that use more than 10% of the casing-head product. Naptha is a generic term which describes that fraction obtained by the distillation of crude oil before the product kerosene is reached. The process of blending is a process of refining. The material shipped from Kiefer, Drumright and Jenks to Port Arthur is properly designated by the name of unrefined naptha. It might also be appropriately called unfinished naptha or unfinished gasoline blend, or unrefined casing-head blend, or unfinished casing-head blend. Unrefined naptha will embrace any naptha which is not ready for use, not completely refined; it will embrace materials referred to as tops. It would not be possible in this day for a refinery in the production of gasoline to operate successfully without blending as part of its process. There is great confusion and misuse of names. The names of the finished product are frequently applied to the materials which ultimately become such product. It is not a practical thing to blend casing-head at the plant to a finished marketable condition, to do that you would have to bring to the casing-head plant 90 to 95% of other refinery products, or locate the refinery at the casing-head plant, and as the well was exhausted move the refinery. Blending is for the initial point, for end points, for gravity; not for one point but anywhere from 5 to 14 points, including various distillation points in the curve, also to meet the various specifications, and it requires considerable experience and an intimate knowledge of the products used.

Dr. Bacon, chemist, holds master and doctor degrees; in Government service until 1911; since then in the Industrial Research Department University of Pittsburgh, now Mellon Institute; was Colonel on General Pershing's staff in France and in charge of chemical work for one year; member of technical societies. One of the authors of Bacon and Hamor on American Petroleum Industry. Has written a large number of papers for scientific journals; made a large number of tests of various kinds of petroleum products; his studies have embraced casing-head gasoline. The material now sold as gasoline was not manufactured prior to the advent of the automobile. Crude oil was then run into other products. The material shipped from Kiefer, Drumright, and Jenks to Port Arthur is not gasoline. Gasoline is a mixture of combustible liquids, a finished product that will satisfactorily run a motor car. The automobile industry has dominated the petroleum industry so that demand for oil has been almost entirely in the direction of gasoline; 90 to 95% of it is used for running automobiles. Naptha fractions of petroleum include all fractions from the beginning up to illuminating oil. Gasoline now contains portions of the crude heavier than the naptha fractions were a few years ago. In the early days when kerosene or lamp oil was wanted the naptha fractions were exceedingly narrow, but now they are made as wide as can be. The term gasoline is loosely applied to the material from which the finished product is to be produced. We speak about boiling point,

Baume gravity and distillation curves; that is one way to look at these things and state that it is a satisfactory gasoline; but the thing behind all this is the actual work. We try it in an engine and if we find it performs satisfactorily it is gasoline; then we make these boiling points and Baume gravity, etc. We have a gasoline engine in the Mellon Institute which is connected up with an apparatus to register the power it develops. Have tested on that machine a very large number of gasoline materials. Then we make gravities and initial points and end points and get the curve of the gasoline, which we know is good gasoline because we worked it out in the engine; then if we get a new gasoline we could probably tell from its boiling points and its curve as to whether it also would be satisfactory gasoline. The thing we do is done in all scientific institutions. We not only test the gasoline in the engine where we can measure the horsepower but we get several different kinds of cars and drive them over the roads near Pittsburgh and see how they perform. I have tested the material commonly called casing-head gasoline; it did not make the engine run at all. Once in awhile you get one that will make the engine run in very unsatisfactory manner. It has very little power and the consumption will be very high; it will spit and misfire, and things of that kind. Dr. Garner and he made distillation curves of this casing-head gasoline and of this blended product, and

they indicate that neither would run a car; they are not 1693 gasoline. Naptha is a term used for any low boiling product of petroleum which boils below the illuminating oil fraction.

[ The blending process is a part of refining. Casing-head can be weathered down to a point where it would run a motor car, but not in a way very satisfactory. It was shown that Bacon and Hamor used the term unrefined naptha, and a Government publication on the chemical properties of California petroleum issued in 1914 uses that term, the term comprehends casing-head gasoline. The witnesses Burrell, Bacon, Garner, and Schock all participated in testing casing-head gasoline and the blended product at the Jenks and Kiefer plants on Packard and Dodge motor cars during the trial, and all testified that the experiments were failures.

+ The prosecution then called W. P. Dykema, graduate Michigan College of Mines in 1905, mining engineering from 1905 to 1909, then did surveying and general engineering in the California oil fields, then returned to silver and copper mining, then in the city engineer's office of Los Angeles until August, 1915, then employed by U. S. Bureau of Mines until March, 1920, and now consulting petroleum engineer; devoted most of his time since 1915 to study of casing-head gasoline, visited plants throughout the country, has written Government bulletins on compression and refrigeration of natural gas published by the Bureau of Mines, petroleum division. Any liquid made from natural gas by compression would in his opinion run a car, that even the lightest product would be good motor fuel; had ridden in cars run by gasoline from compression plants; does not consider compression a refining process; thinks the product

was already refined because it needs no purification. It is commonly known as gasoline in the trade and scientific world; never heard it called unrefined naphtha before, that name is not appropriate; it is misleading in that it would need further refining and purification; it is fit for use as it is and is marketable as it is. The process of blending is not refining; it might be termed a finishing process. He defines gasoline as the lighter petroleum distillates fit for use in an automobile. Said it was not dangerous in the hands of anyone who could use it with reasonable caution, but more dangerous than curb gasoline and would not give equal power per gallon. The fractions, including gasoline, have for a long time been called by the generic name of naphtha. Naphtha embraces all gasoline. Naphtha fractions, after they have been separated in distillation, can be properly  
1694 called unrefined naphtha; they are the light ends of petroleum which need further refining. Part of it is then cut out for gasoline fractions. Refineries are large purchasers of raw casing-head and blended casing-head gasoline. He did not know what they did with it. The attention of this witness was then called to the bulletin of which he was the author, published by the U. S. Bureau of Mines in 1918, entitled: "Recovery of Gasoline From Natural Gas by Compression and Refrigeration," and this excerpt therefrom seems to nullify his testimony that casing-head gasoline is a good or suitable motor fuel:

"Condensate produced by compression is also an undesirable fuel for gasoline engines. It is exceedingly volatile, which causes losses in handling, is dangerous because fumes are easily formed, and gives less power as compared with equal volumes of heavier distillates, a larger number of gallons being required to develop the same power. It gives a quick, sharp explosion in a motor cylinder, but seems to lack 'push' after the explosion has taken place."

The bulletin later on treats rather fully of the methods of blending, and among other things says:

"Some blending companies use with the usual naphthas small quantities of straight still-run gasoline in order to increase the proportions of those hydrocarbons of which the naphtha and the condensate contain only small percentages."

It points out that the products of different casing-head plants are different, even those in the same field; that the gases they treat are different and that each must be separately considered and studied in order to know the percentages of the various hydrocarbon fractions in the casing-head gasoline. He also participated in the test of the casing-head gasoline and of the blended commodity with two automobiles during the trial, and considered the test fairly successful as to the car in which he rode; said that he thought the trouble they did have with it could have been avoided if the carburetor had been adjusted.

Dr. DeBarr, vice president Oklahoma State University and head of department of chemistry, holds bachelor and doctor degrees; said that casing-head gasoline is not properly denominated unrefined

naptha, that it is not refining to blend casing-head gasoline with naptha because both products are refined before they are put together; had used casing-head gasoline in a motor car, drove a Ford several hundred miles on compression gasoline, and a Dodge roadster a week or two with nothing but casing-head compression gasoline. The end point would need to be regulated for use by common people in its volatility, but for a man like himself it need not be regulated; that his knowledge would not entitle him to any protection with regard to volatility but the general public needs protection; he would not let his wife run it unless she learned how to use it. Its boiling points are not the proper boiling points and it is not economical motor gasoline. There is both interchangeability and confusion in the use of the names naptha and gasoline; extreme confusion as to the material more properly called gasoline. If the lighter as against the heavier hydrocarbons are too great the car will not run, and vice versa. Many writers call all of the hydrocarbons that are lighter than kerosene naptha, when derived from crude petroleum. Thinks the term unrefined naptha originated with a Bureau of Mines publication and circular, either there or with Bacon and Hamor.

Throughout the trial, during introduction of evidence and in argument, the prosecution insisted that the conduct of the defendant was fraudulent. One of the grounds of this insistent was the fact that the defendant's traffic agent asked for the rate on unrefined naptha, a commodity which had theretofore been and was then being shipped as gasoline to Port Arthur; but in the light of the ruling of the Interstate Commerce Commission in the National Refining Company case, the rate on unrefined naptha theretofore given by one of the carriers to Baton Rouge on a commodity shown to be substantially the same as the condensate of the Gypsy Company's plants, and the testimony in this case, we think the insistence groundless and must have been highly prejudicial. Another fact relied on and pressed upon the attention of the jury was that the same commodity was shipped to Pittsburgh by the Gypsy Company as gasoline after December 2, 1916, while shipments were being made to Port Arthur as unrefined naptha, and its effect upon the jury cannot be doubted, but we think this entirely without evidentiary weight in view of the further fact that there was no rate on unrefined naptha to Pittsburgh. Another error assigned is that testimony was admitted over objection showing that the casing-head gasoline and blended product at other casing-head compression plants in Oklahoma were called gasoline and shipped as gasoline, without a showing that they were substantially similar to those of the Gypsy Company, and in the face of proof that they were not of a uniform blend with those of the Gypsy Company but contained, in some instances, as much as 75% naptha. It is also assigned as error that counsel for the prosecution stated in his argument to the jury that the Mellon Institute at Pittsburgh was founded by the Mellon family, and that Mr. Mellon is president of the Gulf Oil Corporation. The

court said there was no evidence of that kind in the record. This statement could have been made for no other purpose than to prejudice the jury against Dr. Bacon and Dr. Garner, witnesses for defendant. Counsel also stated to the jury that during the time part of the shipments were made the Government was operating the railroads and that it had guaranteed the revenue of the railroads, and that the jury would have to contribute to make up any deficiency in that revenue, that the defendant, by the advantage that it got over its competitors in this way placed in its "own pocket hundreds of thousands of dollars which they were not entitled to and which the people of the United States have got to bear the burdens, and it is true that the Gulf Refining Company will have to join, thank goodness, the other people of the United States to pay these things if it had to be paid." On objection the jury was instructed to ignore the statements. All of the assignments that have been mentioned are in our judgment meritorious, the matters complained of were prejudicial and would require a reversal. Many errors are assigned, to the admission and rejection of evidence, to the instructions of the court, to the refusal of requests to instruct, and to comments by the court during the progress of the trial, which it is claimed were prejudicial and unfair. But the view we take of the case renders it unnecessary to pass on them.

It is our opinion that when all competent and relevant proof in the case is given a fair and impartial consideration the conclusion that the verdict is without support is inevitable. The prosecution rested its case in chief on testimony of operators of casing-head compression plants that they called the condensate and their blended products gasoline, believed they were gasoline and shipped them as gasoline; and also on the claimed admissions about which we have expressed our opinion. They could not ship their products otherwise,

there was no rate on unrefined naptha or unfinished naptha to their points of destination; and as to the shipments to the Texas Company at Port Arthur, on which gasoline rates had been exacted and collected, that company had pending in the U. S. District Court for the Eastern District of Texas at the time of the trial an action for the recovery of the difference between what it had been required to pay and the rates on unrefined naptha. The defendant then called witnesses thoroughly familiar, technically and practically, with the recovery of petroleum and natural gas, their treatment, their component parts, their reduction to usable and marketable commodities, and they were in accord in their testimony that the commodities were appropriately designated as unrefined naptha, were unrefined naptha and were not gasoline, and could not be appropriately so designated. They stated the facts on which their conclusions were based. Then the best informed witnesses in behalf of the prosecution, the only ones who spoke with general information on the subject, Dr. DeBarr and Mr. Dykema, were called and both stated that casing-head condensate was too violatile and dangerous for use as gasoline—the former as a witness and the latter in his

article prepared and issued as an official bulletin by the Bureau of Mines; and neither claimed that either the condensate or the blended  
y product would fulfil any specification for gasoline.

We think the court erred in refusing defendant's request for an instructed verdict in its favor.

Reversed and remanded.

*Judgment.*

United States Circuit Court of Appeals, Eighth Circuit.

September Term, 1922.

Monday, September 11, 1922.

GULF REFINING COMPANY, PLAINTIFF IN ERROR,

*vs.*

UNITED STATES OF AMERICA.

No. 5899.

In error to the District Court of the United States for the Eastern District of Oklahoma.

This cause came on to be heard on the transcript of the record from the District Court of the United States for the Eastern District of Oklahoma, and was argued by counsel.

On consideration whereof, it is now here ordered and adjudged by this court, that the judgment of the said District Court in this cause be, and the same is hereby, reversed without costs to either party in this court.

It is further ordered that this cause be, and the same is hereby, remanded to the said District Court with directions to grant a new trial.

September 11, 1922.

1699 *Application of defendant in error for extension of time to file petition for rehearing.*

[Telegram.]

WASHINGTON, D. C., Nov. 4-22.

E. E. KOCH,

*Clerk Ninth Circuit Court of Appeals, St. Louis.*

Because of important bearing of the decision in Gulf Refining Co. versus United States on reparation claims which may amount to several million of dollars the Interstate Commerce Commission is exceeding anxious that the government file a petition for rehearing Stop We did not obtain copy of opinion until short while ago Stop Will you therefore please ask Court for an order extending time until Dec. first to file rehearing petition.

DAUGHERTY.

(Endorsed): Filed in U. S. Circuit Court of Appeals, Nov. 4, 1922.

*Order extending time to file petition for rehearing until December 1, 1922.*

September term, 1922.

Tuesday, November 7, 1922.

Upon application of the Attorney General of the United States, in behalf of the defendant in error in this cause, and for good cause shown, It is ordered by this court that the time for filing a petition for a rehearing herein be, and the same is hereby, extended until December 1, 1922, and that the issuance of the mandate of this court be, and the same is hereby, stayed pending the filing of said petition and if filed the issuance of the mandate will then be withheld until said petition has been acted on.

NOVEMBER 7TH, 1922.

*Petition of defendant in error for a rehearing.*

*To the honorable the United States Circuit Court of Appeals for the Eighth Circuit and the honorable Judges thereof.*

The United States of America, defendant in error in the above-entitled cause, does most respectfully petition for a rehearing upon the writ of error in said cause and to that end does move said court to set aside and vacate the rulings and orders heretofore made in said cause reversing the judgment of, and remanding said cause to, the said District Court of the United States for the Eastern District of Oklahoma, and does further petition and pray that the said writ of error be further considered by this court, with leave to the defendant in error to further argue and present the same, and that upon a re-submission of said writ of error for decision the said judgment of said district court be affirmed.

And defendant in error respectfully submits the following grounds in support hereof:

1. The evidence in the case was sufficient to require submission of the case to the jury.
2. The evidence in the case supported the verdict.
3. The evidence in the case shows that plaintiff in error was guilty, as charged, beyond a reasonable doubt.
- 1704 4. There was no prejudicial error in the admission or rejection of evidence.
5. The statements made by counsel for the Government in their argument to the jury were not improper and did not constitute reversible error.

6. No error prejudicial to the plaintiff in error, requiring reversal, was committed by the trial court.

Respectfully submitted.

*Order denying petition for rehearing.*

December Term, 1922. Tuesday, January 16, 1923.

This cause came on this day to be heard upon the petition for a rehearing, filed by counsel for defendant in error.

On consideration whereof, it is now here ordered by this court, that said petition for a rehearing of this cause, be, and the same is hereby, denied.

January 16, 1923.

*Clerk's certificate*

United States Circuit Court of Appeals, Eighth Circuit

I, E. E. Koch, clerk of the United States Circuit Court of Appeals for the Eighth Circuit, do hereby certify that the foregoing transcript composed of two volumes, Volume I consisting of pages 1 to 950, inclusive, and Volume II consisting of pages 951 to 1702,

inclusive, contains the transcript of the record from the District Court of the United States for the Eastern District of Oklahoma as prepared, printed, and certified by the clerk of said District Court to the United States Circuit Court of Appeals in pursuance of the act of Congress approved February 13, 1911, and full, true, and complete copies of all the pleadings, record entries and proceedings, including the opinion, had and filed in the United States Circuit Court of Appeals, except the full captions, titles, and endorsements omitted in pursuance of the rules of the Supreme Court of the United States, in a certain cause in said Circuit Court of Appeals wherein the Gulf Refining Company, a corporation, was plaintiff in error, and the United States of America was defendant in error, No. 5899, as full, true, and complete as the originals of the same remain on file and of record in my office.

I do further certify that on the thirty-first day of January, A. D. 1923, a mandate was issued out of said Circuit Court of Appeals in said cuase, directed to the judges of the District Court of the United States for the Eastern District of Oklahoma.

In testimony whereof, I hereunto subscribe my name and affix the seal of the United States Circuit Court of Appeals for the Eighth Circuit, at office in the city of St. Louis, Missouri, this tenth day of April, A. D. 1923.

(Endorsed): U. S. Circuit Court of Appeals, Eighth Circuit, No. 5899. Gulf Refining Company, plaintiff in error, vs. United States of America. Stipulation as to return to writ of certiorari. Filed July 10, 1923, E. E. Koch, clerk.

1705 UNITED STATES OF AMERICA, ss:

*The President of the United States of America to the honorable the Judges of the United States Circuit Court of Appeals for the Eighth Circuit, greeting:*

Being informed that there is now pending before you a suit in which Gulf Refining Company is plaintiff in error and The United States of America is defendant in error, No. 5899, which suit was removed into the said Circuit Court of Appeals by virtue of a writ of error to the District Court of the United States for the Eastern District of Oklahoma, and we, being willing for certain reasons that the said cause and the record and proceedings therein should be certified by the said Circuit Court of Appeals and removed into the Supreme Court of the United States, do hereby command you that you send without delay to the said Supreme Court, as aforesaid, the record and proceedings in said cause, so that the said Supreme Court may act thereon as of right and according to law ought to be done.

Witness the Honorable William H. Taft, Chief Justice of the United States, the twenty-third day of June, in the year of our Lord one thousand nine hundred and twenty-three.

WM. R. GRANSBURY,

*Clerk of the Supreme Court of the United States.*

UNITED STATES OF AMERICA, PETITIONER,	} No.—
v.	
THE GULF REFINING COMPANY, A CORPORATION, respondent.	

---

## PETITION FOR WRIT OF CERTIORARI TO THE CIRCUIT COURT OF APPEALS FOR THE EIGHTH CIRCUIT.

*To the honorable the Supreme Court of the United  
States:*

The United States of America hereby respectfully petitions that a writ of certiorari be issued to review the judgment of the Circuit Court of Appeals for the Eighth Circuit reversing and remanding a judgment of conviction on which a fine of \$99,000.00 was entered by the United States District Court for the Eastern District of Oklahoma on 99 counts of an indictment charging respondent with receiving concessions and discriminations in rates on shipments of gasoline from Kiefer, Drumright, and Jenks, Oklahoma, to its refinery at Port Arthur, Texas, in violation of the Elkins Act of February 19, 1903, 32 Stat. 847, as amended June 29, 1906, 34 Stat. 587. The shipments in question had been billed to respondent by

543065

its subsidiary, the Gypsy Oil Company, as "unrefined naphtha," and respondent had paid only the lower charges applicable to that commodity instead of the higher charges applicable to gasoline. January 16, 1923, said Circuit Court of Appeals entered an order denying the petition of the Government for rehearing of the case.

#### STATEMENT.

Respondent and the Gypsy Oil Company are both subsidiaries of the Gulf Oil Corporation, but for convenience the Gypsy Oil Company is herein referred to as respondent's subsidiary.

The Gypsy Oil Company produced condensates from natural gas at its compression plants at Kiefer, Drumright, and Jenks, Oklahoma.

The Interstate Commerce Commission, under the powers conferred upon it in the so-called Transportation of Explosives Act, Criminal Code, sections 233-236, 35 Stat. L. 1134, had issued regulations forbidding the transportation of such condensates in ordinary tank cars, unless their vapor pressure had been reduced to a maximum of 10 pounds per square inch, and requiring when so shipped, either alone or blended with other petroleum products, that they be shipped and described as gasoline, casing-head gasoline, or casing-head naphtha. These regulations further required that the shippers certify that the shipments were "properly described by name \* \* \* according to the regulations prescribed by the Interstate Commerce Commission." (Record, 1216-1270.)

In addition, these regulations had been published and filed with the Interstate Commerce Commission by the carriers in their tariffs as Rule 44 of the Western Classification, which governed all the shipments covered by the indictment. (Record, 1040-1211.)

Respondent's subsidiary and all other shippers of such condensates, in order to reduce their vapor pressure to the maximum of 10 pounds per square inch prescribed by the Commission for shipment in ordinary tank cars, either weathered the pure condensate (that is, exposed it to the atmosphere until its pressure became reduced) or blended it with crude naphtha. As has been stated, the Commission's regulations, and the carriers' tariffs *required such condensates, either alone or blended with other petroleum products, to be shipped and described as gasoline, casing-head gasoline, or casing-head naphtha*, and prior to December 2, 1916, respondent's subsidiary (Record, 188-191, 208-209), as well as all other shippers (Record, 427-428), so shipped and described such shipments, and respondent paid the gasoline rates applicable thereto (Record, 281).

During the entire period of the indictment all other shippers continued to bill such shipments as gasoline and to pay the rates applicable thereto. (Record, 427-428.) On December 2, 1916, however, respondent obtained the publication of lower rates on "unrefined naphtha" from these Oklahoma points to Port Arthur, which rates were about 59 per cent of the rates on gasoline, and thereafter respondent's subsidiary, without making any change whatever

in the nature of its shipments (Record, 550), and contrary to the Commission's safety regulations and to the carriers' tariffs, and though continuing to certify that its shipments were properly described by name as required by the regulations of the Interstate Commerce Commission (Record, 959, 961, 963, 966), shipped and described such condensates as "unrefined naphtha" and respondent paid only the lower rates applicable to that commodity (Record, 550). Moreover, the Government contended and introduced evidence (Record, 1363-1377) showing that the respondent had obtained the publication of these rates on "unrefined naphtha" by misrepresentation and by concealing the fact that it was intended to ship these condensates under that description, contrary both to the Commission's regulations and to the carriers' tariffs. In addition, the Government proved that, though these rates on "unrefined naphtha" were open to respondent's competitors, if such were a proper description of these condensates, respondent's competitors, during the entire period covered by the indictment, continued to ship such condensates as gasoline and to pay the higher rates applicable to that commodity (Record, 427-428), and that respondent's subsidiary itself continued to use this description in shipping such condensates to other points (Record 214-215).

According to the Bureau for the Safe Transportation of Explosives, gasoline is more destructive than dynamite, and is the most destructive article handled by the railroads, and the records of that Bureau

show that at Memphis, Tennessee, on January 24, 1921, 13 people were killed, 18 people were injured, and a large loss of property resulted from an explosion of a tank car of casing-head gasoline; that at Ardmore, Oklahoma, on September 27, 1915, 39 people were killed, a large number of people were injured, and a large loss of property resulted from an explosion of another tank car of the same commodity; that at Gainesville, Texas, on May 18, 1917, 1 railway employee was killed, and 3 other persons were injured by the explosion of a tank car of casing-head gasoline blended with naphtha, shipped by respondent's subsidiary to the respondent; and that 14 other such explosions since April 21, 1911, have resulted in the death of 19 people and the injury of 58.

**REASONS FOR GRANTING THE PETITION.**

**I.**

The judgment of the Circuit Court of Appeals conflicts with, and practically nullifies, the powers of the Government under the so-called Transportation of Explosives Act to enforce the regulations promulgated by the Interstate Commerce Commission for the safe transportation of explosives and other dangerous articles.

It is most remarkable that the opinion of the Circuit Court of Appeals *does not even mention* the Commission's explosive regulations, requiring these condensates to be shipped and described as gasoline, though such regulations appear in full in the record. (Record, 1216-1270.)

## II.

Said judgment practically nullifies the powers conferred upon the Interstate Commerce Commission under sections 1, 6, 13, and 15 of the Act to Regulate Commerce, to prescribe just and reasonable rates and classifications and just and reasonable regulations and practices affecting the manner in which property tendered for transportation shall be marked and described.

It is again most remarkable that the opinion of the Circuit Court of Appeals *does not even mention* the fact that Rule 44 of the Western Classification governing these shipments required such condensates to be described as gasoline, though such tariff provision appears in full in the record. (Record, 1040-1211.)

Moreover, the judgment of that court requires the carriers to accept approximately 59 per cent of their published gasoline rates on such condensates, though the gasoline rates remain the published rates, and though they have never been found unreasonable by the Interstate Commerce Commission, but, on the contrary, have been expressly held reasonable, as applied to such condensates, in the case of *Southern Carbon Company v. A. & L. M. Ry. Co.*, 62 I. C. C. 733, cited to the court in the Government's petition for rehearing.

## III.

The judgment of the Circuit Court of Appeals seriously imperils the Government's interests in the

following pending litigation in relation to similar misbilling of casing-head gasoline as "unrefined naphtha":

(a) It practically precludes the Government from prosecuting 7 other criminal indictments pending in the Eastern District of Oklahoma against the respondent, its officers, and certain carriers, charging violations in this respect of the Elkins Act, of the Act to Regulate Commerce, and of the so-called Transportation of Explosives Act.

(b) It practically precludes the Government, through the Director General of Railroads, from collecting undercharges outstanding against the respondent in this respect, aggregating approximately \$500,000.

(c) It probably subjects the Government, through the Director General of Railroads as Agent of the President, to liability for overcharges in this respect, aggregating approximately \$500,000.

#### IV.

The action of the Circuit Court of Appeals in reversing the judgment of the District Court on the ground that the District Court erred in refusing defendant's (respondent's) request for an instructed verdict, is extraordinary and unjustifiable in any event.

This action of the Circuit Court of Appeals could only be justified if the District Court would have been warranted *in holding, as a matter of law*, that these condensates were unrefined naphtha and not

gasoline, and in withdrawing that question from the jury on that ground. In fact, the Circuit Court of Appeals reaches this conclusion by choosing by what amounts to a mere fiat to accept *as conclusive* the testimony of certain expert chemical witnesses for respondent that these condensates were *chemically* unrefined naphtha, entirely disregarding the admissions of these same experts that these condensates were popularly known as gasoline (Record, 694); that their designation as gasoline had been prescribed by the Interstate Commerce Commission for transportation purposes both with reference to safety (Record, 1216-1270) and to rating (*Southern Carbon Co. v. A. & L. M. Ry. Co., supra*); that the carriers' tariffs prescribed their designation as gasoline (Record, 1040-1211); that the respondent and its subsidiary were the only shippers who ever designated such condensates as "unrefined naphtha" (Record, 427, 428); and that the respondent and its subsidiary had previously invariably designated them as gasoline (Record, 188-191, 208-209), and that respondent's subsidiary continued to so designate them in shipments to other points (Record, 214, 215).

#### V.

Accepting at their face value the alleged errors in the admission of certain testimony and in remarks of counsel to the jury, assigned by the Circuit Court of Appeals as among the grounds upon which that court reversed and remanded for dismissal, such errors warranted the Circuit Court of Appeals at most in remanding the case for a new trial.

In fact, the Government undertakes, if the writ is granted, to show that no errors were committed by the District Court in this respect.

It is therefore respectfully submitted that this court, in view of the public importance of the questions involved, and the extraordinary action of the Circuit Court of Appeals in reversing and remanding for dismissal, instead of at most remanding the case for a new trial, should issue its writ of certiorari to review the judgment of the Circuit Court of Appeals in this respect.

Respectfully submitted.

JAMES M. BECK,  
*Solicitor General.*

## STATEMENT OF THE CASE

This is a criminal prosecution for receiving concessions in rates in violation of Section 1 of the Interstate Commerce Act (32 Stat. 847-8) as amended by the act of June 29, 1906 (34 Stat. 584). There were one hundred counts in the indictment. The first forty counts are based on alleged concessions received on consignments of gasoline shipped from Kiefer, Oklahoma, to West Port Arthur, Texas. (Vol. 1, pp. 2-62.) Counts 41 to 85, inclusive

(pp. 62-123), were based on shipments of gasoline from Jenks, Oklahoma, to West Port Arthur, Texas, and the remainder of the counts were based on shipments from Drumright, Oklahoma, to West Port Arthur (pp. 124-145). A plea in abatement was filed, but on motion was stricken out by the court. (Vol. 1, p. 147.) A demurrer to the indictment was also filed which was overruled. (Vol. 1, p. 150.) A trial was had, and all the counts, except No. 44, were submitted to the jury; and the jury found the defendant guilty on each of the ninety-nine counts. The court thereupon imposed the minimum fine of \$1,000 under each count, and pronounced judgment against the defendant for \$99,000. (Vol. 1, p. 167.) A motion for a new trial was made and overruled. (Vol. 1, p. 943.) The defendant then entered a motion in arrest of judgment, which was also overruled (p. 948). Errors were assigned, and an appeal was prosecuted to the Circuit Court of Appeals for the Eighth Circuit; and that court sustained a number of the assignments of error, and remanded the cause to the District Court "with directions to grant a new trial." (Vol. 2, p. 1692.) The grounds upon which a new trial was awarded appear in the opinion of the Court (Vol. 2, pp. 1690, 1691) and will be stated in the assignment of errors.

REPLY TO DEFENDANT'S MOTION TO DISMISS OR  
AFFIRM

## I

This court has jurisdiction to bring the case here by writ of certiorari

The defendant insists that the case, being a criminal one, can not at the instance of the Government be removed to this court by writ of certiorari.

By Section 6 of the act establishing the Circuit Court of Appeals (Chapter 517, Act of 1891; 26 Stat. 826, 828), appellate jurisdiction, except in specified cases, was vested in the Court of Appeals; and it was provided that the—

judgments \* \* \* of the circuit courts of appeals shall be final in all cases \* \* \* arising \* \* \* under the criminal laws;

except the Circuit Court of Appeals may certify to the Supreme Court any question or proposition of law concerning which it desires instruction for its decision—

And excepting also that in any such case as hereinbefore made final in the circuit court of appeals it shall be competent for the Supreme Court to require, by certiorari or otherwise, any such case to be certified to the Supreme Court for its review and determination with the same power and authority in the case as if it had been carried by appeal or writ of error to the Supreme Court.

In *United States v. Dickinson*, 213 U. S. 92, it was held that this provision did not authorize this

128  
jud

court to take jurisdiction over a criminal case in which a judgment of conviction had been reversed by the Circuit Court of Appeals. That case was decided in 1909. And when the Judicial Code was adopted in 1911, Section 240, which embodies the provision of the act of 1891, that relates to the removal of causes from the Circuit Court of Appeals to this court by writs of certiorari, was made to read as follows:

In any case, *civil or criminal*, in which the judgment or decree of the circuit court of appeals is made final by the provisions of this Title, it shall be competent for the Supreme Court to require, by certiorari or otherwise, *upon the petition of any party thereto*, any such case to be certified to the Supreme Court for its review and determination, with the same power and authority in the case as if it had been carried by appeal or writ of error to the Supreme Court. (36 Stat., Chap. 231, p. 1157.)

Omitting the italicized words, this section is exactly the same in substance as the provision originally enacted. The intention to confer jurisdiction upon this court to issue a writ of certiorari to the Circuit Court of Appeals in a criminal case on petition of the Government could not possibly be more clearly expressed. By no possible refinement of construction can the Government be eliminated from the phrase "upon the petition of *any party thereto*." But if any doubt could otherwise exist, it is dispelled by what occurred in the Senate when the words above

italicized were introduced as an amendment to the report of the Committee that had the bill in charge. The following appears in the proceedings of the Senate (46 Cong. Rec. 2134):

The VICE PRESIDENT. \* \* \* The Senator from Utah (Mr. Sutherland) offers the following amendment:

The SECRETARY. On page 173, section 227, in line 6, after the word "case," insert "civil or criminal," and in line 9, after the word "otherwise," insert "upon the petition of any party thereto."

Mr. HEYBURN. I call the attention of the Senator from Utah to the effect this amendment would have. Would that include the United States as a party?

Mr. SUTHERLAND. *That is the object of it.*

Mr. HEYBURN. *It permits the United States to ask through certiorari proceedings for a review of a criminal case?*

Mr. SUTHERLAND. *Yes.*

Mr. HEYBURN. It is pretty wide departure, it seems to me. I do not want to enter into much controversy about it, but it seems to me that it is going a good ways from the established rule to allow the United States to review a criminal case by writ of certiorari.

Mr. SUTHERLAND. *The object of it is this: Very often in the circuit court of appeals a criminal case has gone off on a purely technical proposition, and there is no way by which the question can be got to the Supreme Court of the United States. I think in some cases it is a great necessity that the Supreme Court of the*

*United States should have the power to review such a case.*

MR. HEYBURN. We hesitated a long time before we allowed the right of appeal to the United States in criminal cases. It is only a few months since we enacted that legislation. *Now, if we allow the United States, in a case where there is no right of appeal, to bring up upon certiorari a criminal case that has been decided adversely to the United States, it is going a long way. I will not do more than interpose these suggestions. I had not anticipated any such amendment being offered. It so radically widens the jurisdiction in the matter of appeals in criminal cases that it seems to me that it ought to go to a standing committee—the Judiciary Committee—of the Senate. But I am willing to let it pass in. It will be considered in conference.*

THE VICE PRESIDENT. The question is on agreeing to the amendment proposed by the Senator from Utah.

The amendment was agreed to.

True, it has often been said rather than practised that debates of a legislative body can not be looked to in construing a statute, but it is well settled that the report of the committee having the bill in charge can be considered by the court. Certainly with greater reason can consideration be given to the explanation as to the purpose and meaning of an amendment given by the member who introduced it, and as a result of which explanation it is then and there adopted.

The bill went to conference; and the report of the conference committee to the House of Representatives was accompanied by a statement in which reference was made to Section 240 as follows (46 Cong. Rec. 4001):

The other amendments made by the Senate, embracing substantive changes, were as follows:

\* \* \* \* \*

Section 240 (227). The insertion of the words, "civil or criminal," and the words "upon the petition of any party thereto." The effect of this amendment is to make more clear the right of the Supreme Court of the United States by writ of certiorari to bring before it for review any case in which the judgment or decree of the Circuit Court of Appeals is made final by the provisions of the Act, and to define more accurately the method by which such writ might be obtained.

It is suggested that this language indicates, not a purpose to extend the power of the court, but to eliminate uncertainty as to the power already possessed. In fact the broad language used in the original act creating the Circuit Court of Appeals does include cases of this character, but following by analogy *United States v. Sanges*, 144 U. S. 310, the court was constrained to hold that Congress did not intend to vest the power in this court to issue a writ of certiorari in a criminal case on petition of the Government. In other words, in the *Dickinson* case, the court held that, although the language was broad

enough to include such a case, it would not be construed to do so, because it had been a principle recognized not only by this court, but by the courts of a large majority of the States and of England, not to permit a review of a criminal case by an appellate court at the instance of the Government *unless authority was given by express language*. Therefore the language of the conference committee was apt, because the intention was to make it clear, so clear as to remove any doubt upon the subject, that such authority was vested in this court. If the words added on motion of Senator Sutherland do not have that effect, then what do they mean? And what sense is there in the language used by the Conference Committee? Instead of making more clear the extent of the power of the Court and defining more accurately how the writ may be obtained, they would be senseless, and would but add uncertainty as to the powers possessed by the court in this respect.

## II

**The fact that the mandate, following the judgment of the Circuit Court of Appeals, directs a new trial is immaterial**

Although the court in its opinion held that the trial court committed error in not directing a verdict for the defendant, yet in its judgment it remanded the case to the District Court "with directions to direct a new trial."

But so far as the jurisdiction of this court is concerned it can make no difference whether the judg-

ment in the Circuit Court of Appeals was final or not. There is a broad distinction between final decisions of district courts, which the circuit court of appeals is given authority to review by section 128 of the Judicial Code, and "a final judgment or decree in any suit in the highest court of a State," which, if involving certain questions, can be reviewed by this court, and judgments and decrees of the circuit courts of appeal, which are declared final by said section 128. What is meant by the judgments and decrees of that court being final in the classes of cases specified is that there is no appeal therefrom as a matter of right, and they can only be reviewed by writs of certiorari. As said by the Chief Justice in *Lau Ow Bew v. United States*, 144 U. S. 47, 57:

By this section judgments or decrees in the enumerated classes of cases are made final in terms by way of the exclusion of any review by writ of error or appeal, while as to cases not expressly made final by this section, appeal or writ of error may be had of right, where the money value of the matter in controversy exceeds one thousand dollars besides costs.

The effect of the provision is thus clearly stated by the court in *American Construction Company v. Jacksonville Railway Company*, 148 U. S. 372, 385:

Then follows the provision in question, conferring upon this court authority "in any such case as is hereinbefore made final in the Circuit Court of Appeals," to require, by *certiorari* or otherwise, the case to be certified to this

court for its review and determination. There is nothing in the act to preclude this court from ordering the whole case to be sent up, when no distinct questions of law have been certified to it by the Circuit Court of Appeals, at as early a stage as when such questions have been so certified. The only restriction upon the exercise of the power of this court, independently of any action of the Circuit Court of Appeals, in this regard, is to cases "made final in the Circuit Court of Appeals," *that is to say, to cases in which the statute makes the judgment of that court final, not to cases in which that court has rendered a final judgment.* Doubtless, this power would seldom be exercised before final judgment in the Circuit Court of Appeals, and very rarely indeed before the case was ready for decision upon the merits in that court. But the question at what stage of the proceedings, and under what circumstances, the case should be required, by *certiorari* or otherwise, to be sent up for review, is left to the discretion of this court, as the exigencies of each case may require.

Since the preparation of this brief this court granted, on October 20, 1924, a writ of *certiorari* on petition of the United States in the case of *United States, Petitioner, v. Trenton Potteries Co. et al.*, No. 591, on the docket of the Supreme Court for the present term. That case was in the same condition as this, except the Court of Appeals had not held that there was no evidence to sustain the verdict of the jury.

## III

**The questions presented in this case are of such gravity as to require their review by this court**

The questions presented in this case are vitally important for the following reasons:

1. The Circuit Court of Appeals has undertaken to pass upon the merits of the case, and by casting aside all evidence relating to common understanding and the conduct and practices of defendant itself, and giving attention solely to technical but indefinite and contradictory definitions of gasoline given by experts, when their own testimony show that their definitions are wholly inaccurate, has determined that the record presents no controverted question of fact. In a case of great magnitude, and upon the determination of which the rights of many other parties depend, a departure from fundamental and universally recognized principles applicable in determining whether a case involves a question of fact for the decision of a jury itself requires a review of the case by this court.

2. The Circuit Court of Appeals has in effect decided that, in determining under what rate an article shall be shipped, the name by which the article is generally known by its producers and by the trade, and under which it has always been shipped, except by the accused under the circumstances out of which the controversy has arisen, and its similarity to and in important particulars identity with an article which undisputably must be shipped under a

specified rate, *has no evidential weight whatever*, but that the shipping name of the article is to be determined *entirely* by its characteristics as described and its technical definition given by experts, and has thus overruled the well-recognized principle that the shipping name of a commodity is that under which it is generally known in commerce and among those by whom it is produced, used, and consumed.

3. The Circuit Court of Appeals in its decision disregarded entirely the regulations of the Interstate Commerce Commission, made within the scope of its authority, wherein the Commission directed that the commodity here in question be designated as "gasoline," and directed that it be shipped under that name.

4. In *Southern Carbon Company v. Arkansas and Louisiana Midland Railway Company*, 62 I. C. C. 733, which was decided after the trial of this case in the District Court but before the decision was handed down by the Circuit Court of Appeals, the Interstate Commerce Commission held that a commodity identical with casinghead gasoline was "gasoline," and that rates on "gasoline" were applicable thereto, and therefore a conflict upon this question exists between the Circuit Court of Appeals and the Interstate Commerce Commission, the body upon which Congress has expressly conferred authority to determine questions of this character.

## ASSIGNMENT OF ERRORS

The United States insists that the Circuit Court of Appeals erred in the following respects, to wit:

## I

In holding that "When all competent and relevant proof in the case is given a fair and impartial consideration the conclusion that the verdict is without support is inevitable"; and that the trial court "erred in refusing defendant's request for an instructed verdict." (Vol. 2, pp. 1691, 1692.) ✓

This question was raised in the Court of Appeals in the sixth assignment of error. (Vol. 2, pp. 1543, 1544.)

## II

In holding that plaintiff improperly throughout the trial in the District Court insisted that the conduct of the defendant was fraudulent, one ground for the insistence being that its traffic agent asked for the rate on unrefined naphtha; when the claim of fraud in that respect was refuted by the fact that the Interstate Commerce Commission had established a rate to Baton Rouge on a product designated "unrefined naphtha" shown to be substantially the same as the condensate of the Gypsy Company plant. (Vol. 2, p. 1690.) ✓

Apparently this holding of the court is based on the evidence set out in the assignments of error which appear in Vol. 2 on pages 1544-1548, 1550-1553, 1559-1601, 1632, 1638, 1640, 1641, and 1663.

## III

In holding that it was error for the Trial Court to admit over objection testimony showing that the same commodity was being shipped by the Gypsy Company to Pittsburgh after December 2, 1916, as "gasoline," while it was being shipped to Port Arthur as "unrefined naphtha." (Vol. 2, p. 1690.)

The evidence upon this subject, which it was held should not have been admitted, is set forth in the assignments of error in the Court of Appeals found in Vol. 2, pp. 1569-1588, 1640-1645.

## IV

In holding that the Trial Court erred in admitting over objection testimony that "casinghead gasoline and blended product at other casinghead compression plants in Oklahoma were called gasoline and shipped as gasoline, without a showing that they were substantially similar to those of the Gypsy Company, and in the face of proof that they were not of a uniform blend with those of the Gypsy Company but contained, in some instances, as much as 75% naphtha." (Vol. 2, p. 1690.)

The evidence, which under this holding should not have been admitted, is set forth in the assignments of error in the Court of Appeals, appearing in Vol. 2, pp. 1569-1588, 1640-1645.

## V

In holding that the remarks of government counsel in argument to the jury to the effect that the Mellon

Institute at Pittsburgh was founded by the Mellon family and Mr. Mellon is president of the Gulf Oil Corporation, and also that the company by this advantage put in its own pocket hundreds of thousands of dollars which it was not entitled to, and of which the people of the United States have to bear the burdens, afforded grounds for reversal. (Vol. 2, pp. 1690, 1691.)

The assignment of error in the Court of Appeals relating to this subject is 117, p. 1663, and the remarks referred to by the Court of Appeals appear in the record, Vol. 1, pp. 905-907.

#### BRIEF AND ARGUMENT

The assignments of error will be considered in the order mentioned.

#### I

The Circuit Court of Appeals erred in holding that "When all competent and relevant proof in the case is given a fair and impartial consideration the conclusion that the verdict is without support is inevitable," and that the trial court "erred in refusing defendant's request for an instructed verdict"

The finding by the Court of Appeals, that the verdict of the jury is without support of evidence, necessitates a somewhat extended citation of the evidence and discussion of the facts; but such discussion will enable the Court to readily see the relevancy of the evidence which that court held should have been rejected.

The shipments in question were made to defendant by the Gypsy Oil Company; and it was admitted that the Gulf Oil Company is a corporation of which the Gypsy and Gulf Refining Companies are subsidiaries, the Gulf Oil Company owning all the stock of the other two companies except a few shares personally held by the directors for qualifying purposes. (Vol. 1, p. 210.) It is also shown without dispute that Mr. Donovan was General Superintendent of the Gasoline Department of both the Gulf and Gypsy Companies, and that he reported to Mr. Tabor, who was Vice President of the Gulf Company, and that Mr. Ellis was Traffic Manager for both companies. (Vol. 1, pp. 246-248.) And it was admitted that Mr. Ellis, as Traffic Manager of the Gulf Company, instructed Mr. Donovan how to ship the product in question. (Vol. 1, p. 484.)

After December 2, 1916, between Kiefer, Jenks, and Drumright, oil-producing points in Oklahoma, and Port Arthur and West Port Arthur (the termination of a branch line about two miles in length), Texas, there were two published commodity rates, one on "gasoline in tank cars" at 33¢ per 100 pounds, and the other on "unrefined naphtha in tank cars" at 19½¢ per 100 pounds. (Topping, Vol. 1, pp. 285-288, and exhibits Vol. 2, pp. 985, 1043. The same rates also appear in numerous other exhibits.) There was also a rate of 39¢ on "Oils: Petroleum oil and its products \* \* \* listed under head of 'Petroleum and Petroleum Products.'" (Gov. Ex. 36, Vol. 2, pp. 981, 984, 986, and numerous other tariffs.)

The product in question was shipped as "unrefined naphtha" at the  $19\frac{1}{2}\text{¢}$  rate (Vol. 1, p. 190); and the question of fact for the jury was whether this was a correct designation or whether it should have been shipped as "gasoline" at the 33¢ rate. If the higher rate applied, the defendant received a concession of  $13\frac{1}{2}\text{¢}$  per 100 pounds as alleged in the indictment. Plaintiff here in the beginning emphasizes its contention that the question was not whether the product answered in every respect to a *technical* definition of gasoline, as appears to have been the view of the Court of Appeals, but *what was its proper shipping designation?* When so considered, we respectfully submit, the Court of Appeals could have held with greater reason that there was no material evidence contrary to the verdict, and therefore that no prejudicial error could have been committed in the admission of testimony, in argument of counsel, or in the charge of the court.

The exact nature of the product in question will appear from a consideration of the treatment of crude petroleum and of the products resulting therefrom.

**The "naphtha fraction" and products derived therefrom**

The Government introduced Mr. Pritchard, who was Superintendent of the Gulf Refining Company; and on cross-examination he briefly described the manufacture of petroleum products in so far as it is important in this litigation. He says that the "naphtha fraction" is the portion of the crude oil

which contains gasoline, naphtha, and benzine, and is the lighter hydrocarbons of the crude oil. In the first distillation the "naphtha fraction" is separated from the balance of the crude oil, and is pumped into the agitator and given a sulphuric-acid treatment to purify it before its distillation. It is then put in the steaming still, and is there subdivided into naphtha, benzine, and gasoline. Gasoline is the lighter fraction, benzine the intermediate, and naphtha the heavy. He also says that while in the process of refining they are all called "naphtha," but that after refined some people call one finished product "gasoline," another "benzine," and another "naphtha," and that others call the entire group "naphtha." With this process the distillation is complete, but the product that is to become gasoline is given a chemical treatment varying according to what is required, and is then pumped out into the tanks. (Vol. 1, pp. 586-589.) Defendant's expert Tabor says the "naphtha fraction" includes the parts "which come off from the crude oil from the beginning of distillation down to what goes into burning oil." (Vol. 1, pp. 676, 677.) Pritchard says that painter's naphtha is the heavy naphtha which is used for the purpose of treating, and has a gravity of about 54. (Vol. 1, pp. 585-6.) Riedeman, who was employed from September, 1916, to September, 1918, in the gasoline end of the Gypsy Company, says that he made gravity and color tests of the naphtha that was shipped to Kiefer for blending as hereafter explained, and that the gravity was around

54 (Vol. 1, p. 185); while Otey, who was employed by the defendant as inspector at Port Arthur, says that its gravity was 55.6 plus and its color 25 (Vol. 1, p. 470), which means that it was white.

#### Production of Casinghead Gasoline

Casinghead gasoline is the name of a product obtained from oil wells. Gases emanate in the wells, and these gases are pumped through tubes to plants for treatment. (Riedeman, Vol. 1, pp. 185-6.) If oil gets in the line through which the gas is conducted from the well to the plant the product is discolored and rendered impure. And at Kiefer they had erected a tank, which they called a "scrubber," about four feet in diameter and ten feet high; and the gas was injected into this tank about the center; and the moisture, oil, and other foreign matter was thereby separated from it. (Millard, Vol. 1, pp. 551-2.) The same process was used at Drumright, though Routh did not know the tank was called a "scrubber." (Vol. 1, p. 236.) The gas was reduced into a liquid by compression. (Sweet, Vol. 1, p. 202.) Routh, Superintendent at Drumright, says the vapor tension of the liquid that came from the compressor was from 20 to 30 pounds, and the specific gravity was from 88 to 90, and its color was generally white to the eye. (Vol. 1, pp. 242-3.) Millard, who was Superintendent at Kiefer from February, 1914, to November, 1918, says that the product was generally white, and if colored they shipped it by itself. (Vol. 1, pp. 552-3.)

**Blending of naphtha and casinghead gasoline at compression plants, and the character of the resultant product**

Naphtha or painter's naphtha, which is above described and is one of the products resulting from the steam distillation of the naphtha fraction, was shipped in tank cars from the refining plant at West Port Arthur to the casinghead plants, and there blended with the casinghead gasoline. This naphtha was shipped north in clean cars. (Riedeman, Vol. 1, p. 186.) Riedeman says that the two products were blended "to lower the gravity of the casinghead gasoline." (Vol. 1, p. 187.) The vapor tension of the casinghead gasoline was generally about 10 pounds to the square inch; and this blend with the naphtha was made to reduce the pressure below 10 pounds. According to Routh the blend at Drumright was in the proportion of 35% naphtha and 65% gasoline. After the blend was made, it was weathered so as to still further reduce the vapor tension. (Vol. 1, pp. 236-7.) Sweet thinks that at Kiefer the blend was about one-third naphtha and two-thirds gasoline. (Vol. 1, p. 203.) The color of the blended material as a general proposition was white, and its gravity varied from 70 to 75. (Vol. 1, p. 243.) Pritchard says that the naphtha is used as a holder or container of the casinghead gasoline, and absorbs and keeps it in a liquid solution, and makes it safer to handle. (Vol. 1, p. 591.) Pritchard also says that the specific gravity of this product received from Jenks was about 77 or 78, and some as high as 80, that the average color was 24 to 25 and the vapor tension was about 8 (Vol.

1, pp. 594-5), and that the gravity of that received from Drumright was about 77. (Vol. 1, p. 596.) After the naphtha and gasoline were blended it was shipped to West Port Arthur in the same cars in which the naphtha had been transported from that point; and if the cars had become in any respect dirty, they were cleaned. (Riedeman, Vol. 1, pp. 186-7.) The Jenks product appears to have been unblended, and prepared for shipment only by weathering. Pritchard says it was unblended. (Vol. 1, p. 594.) Millard says it was weathered at Jenks, but the product obtained was similar to that shipped from Kiefer. (Vol. 1, p. 554.)

It was this blend of casinghead gasoline with the painter's naphtha shipped from West Port Arthur that defendant shipped from Kiefer and Drumright to West Port Arthur, and the unblended casinghead gasoline condensed by weathering from Jenks to West Port Arthur, under the name of and at the rate for "unrefined naphtha."

Both before and during the time these shipments were being made the Gypsy Company shipped the same product to other points than West Port Arthur as "gasoline"

Riedeman testifies that prior to December 2, 1916, by instructions from the company, he had always billed this product as "gasoline." (Vol. 1, pp. 190-1.) Millard testifies that prior to December 2, 1916, the product was always billed as "gasoline," and that there was then no change in the commodity, but only in the name. (Vol. 1, p. 550.) It was admitted that prior to the date when the

"unrefined naphtha" rate went into effect, this commodity was shipped as "gasoline" to all points where that rate did not apply. (Vol. 1, p. 249.)

On January 15, 1914, Traffic Manager Ellis wrote a carrier:

We want to move 10 cars of *gasoline* from Kiefer to Port Arthur, to be handled in our own boats to our eastern distributing stations. (Gov. Ex. 85, Vol. 2, p. 1363.)

On June 2, 1914, Ellis wrote Donovan, Superintendent of the Gypsy Company:

Upon receipt of this letter, will you kindly change routing on the *gasoline* from Kiefer to Port Arthur, so that it will route: Frisco, H. & T. C., T. & N. O., until further instructions. (Gov. Ex. 68, Vol. 2, p. 1290.)

The product was designated *gasoline* in other correspondence, which will be quoted hereafter.

And it was also admitted that from the time the plant was constructed in 1913 up until about the end of 1914 or 1915 the practice was to ship naphtha from Port Arthur to Kiefer and there blend it with casinghead gasoline, and ship the blended product to northern points, describing it as "*gasoline*" (Vol. 1, p. 479); that the shipments north were discontinued, except to defendant's plant at Pittsburgh, which shipments continued up to the present time under the name of "*gasoline*"; that the remainder of the material was shipped to the Fort Worth refinery described as "*gasoline*" up to 1915, and thereafter to Port Arthur refinery billed and de-

scribed as "gasoline" up to December 2, 1916, and thereafter it was shipped from Kiefer to Port Arthur under the designation "unrefined naphtha," and to Pittsburgh as "gasoline." (Vol. 1, pp. 479-80.) And a specific admission was made that *from the same tank* one carload was shipped to West Port Arthur as "unrefined naphtha" and another car to Shady Side, Pittsburgh, as "gasoline." (Vol. 1, pp. 487-8.) See also Sweet, Vol. 1, p. 215; Millard, Vol. 1, p. 549.

Same product was being shipped at the same time by the Gypsy Company **TO CUSTOMERS OF THE GULF REFINING COMPANY DIRECTLY** as "gasoline" //

Government Exhibit 95 (Vol. 2, pp. 1375-76) is "Partial statement of shipments of blended gasoline made from Kiefer, Okla., by Gypsy Oil Company for account Gulf Refining Company consigned directly to customers of Gulf Refining Company;" and with reference to these shipments, Mr. Millard testifies that they were billed as "gasoline"; that the only difference between the product thus shipped and that shipped to Port Arthur was the gravity, but he does not remember the exact amount of naphtha in the blend; that if he had a 70 gravity casinghead gasoline, and wanted to produce a 60 gravity for the purpose of marketing it direct, he would accomplish the result by blending with naphtha, and that if he wanted to reduce it to a 58 gravity he would accomplish it by using more naphtha, and that there was nothing else done to the gasoline that was sold direct than blending it with naphtha. Different customers called for

different gravities in their orders and the product was made to meet the orders. (Vol. 1, p. 555.)

**All other producers than the Gypsy Company both before and after December 2, 1916, shipped this same product as gasoline**

It was admitted by counsel for the defendant that the Texas Company had shipped to itself at Port Arthur over certain railroads, upon the dates, in the cars and the quantities alleged in the counts relating to that company, casing-head gasoline blended about one-third naphtha, and described in the shipping orders as "gasoline," and paid charges for the transportation from Kiefer and Jenks rates, respectively, of 33 and 39 cents per 100 pounds; that the commodity shipped to the Texas Company from Kiefer was produced by Crosby & Gillespie, and that shipped from Jenks by the Totem Gasoline Company. This admission was made subject to objection for irrelevancy. (Vol. 1, p. 382.) It was proven by Anderson, employed by the Kadeshan, Totem & Shade Gasoline Company, which company conducted the Totem operation at Jenks, the Kadeshan & Stone at Stone Bluff, and Kadeshan No. 2 at Broken Arrow, that they produced the same article (Vol. 1, p. 329), and that their shipments were made as gasoline (Vol. 1, pp. 333-4). Mr. McCarroll, who was with Crosby & Gillespie at Kiefer, shows that the product shipped to the Texas Company as gasoline was the same as the product here in question. (Vol. 1, pp. 340-3.) Mr. Haigh, Superintendent of the Casinghead Gasoline Plant located at Jenks, belonging to the Ajax Gasoline Company, testified that there were about ten gasoline

plants at Jenks, and that they all operated on the compression system and made about the same product, and that his company billed the product as liquefied petroleum gas when it was over ten pounds pressure and when under such pressure as "gasoline." (Vol. 1, pp. 396-8, 401.) Mr. League, who was inspector for the Bureau of Explosives, maintained by the railroad companies, and who had tested about 50% of the plants in Oklahoma, testified that prior to December 2, 1916, Mr. Donovan spoke of this product as casinghead gasoline, and that it was the same commodity that he investigated after December 2, 1916 (Vol. 1, pp. 410-413), and that the other plants he mentioned shipped the same product as "gasoline" (Vol. 1, pp. 421, 425-7). He further testified that different blends of casinghead gasoline with naphtha were shipped as gasoline, and that it was shipped under the same name when blended with kerosene or crude oil (Vol. 1, pp. 448-9); and that the range of vapor tension of such shipments was from six to ten pounds (Vol. 1, p. 450). Mr. Scott, who was also an inspector of the Explosive Bureau, gave testimony of like character. (Vol. 1, pp. 456-7.) And Mr. Barnhart, who had charge of Franchot's plant, testified that they shipped the product under the name of gasoline. (Vol. 1, p. 463.) Mr. Sweet testified that the Gypsy Company inclosed in drums the same material, except it contained a higher percentage of the naphtha that came from Port Arthur, and shipped it from Kiefer to various places under the name gasoline. (Vol. 1, pp. 215-17.)

**Correspondence between Gypsy Company and Railroad Company relative to putting in side track at Drumright**

Correspondence between the Gypsy Oil Company and the Railroad Company relating to putting in a spur track at Drumright shows that this product was regarded as gasoline. On November 10, 1916, McKirahan wrote Koontz, both agents of the Railroad Company, in regard to the proposed spur for the Gypsy Company:

I have succeeded in getting a very conservative estimate from the Gypsy Oil Company, *Gasoline* Department, on the business which this new *gasoline* plant at Drumright will bring us. They estimate that there will be shipped 40 carloads of *gasoline* per month which will go to their refinery at Port Arthur, Texas. Inbound they estimate 13 or 14 carloads of naphtha per month which will come from Port Arthur. (Ex. 76, Vol. II, p. 1294.)

And on February 9, 1917, the Gypsy Company wrote McKirahan:

In further reference to the *gasoline* loading rack track we intended to have constructed on your line at Drumright, Oklahoma, I now understand that your company will not permit placing of gasoline loading racks within 400 feet of your main line. \* \* \* It seems to me that rules and regulations governing shipments and handling of *gasoline* are laid down by the railroads and others without giving the matter involved due consideration. (Ex. 75, Vol. 11, p. 1293.)

A number of witnesses, who were familiar with the oil industry, testified that the product in question is known as gasoline and is gasoline

Anderson of the Kadeshan, Totem & Shade Company when asked to describe the product says:

It was blended gasoline (Vol. 1, p. 332).

And Haigh, of the Ajax Company, when asked the name of the commodity he produced (which was of the same character) answered, "Gasoline." And when asked by the court what the commodity was called said:

*Gasoline* after it (is) condensed.

The Court. What do you mean by condensed?

A. Run through a set of cooling coils and condensed into a liquid form (which he explains was a part of the condensing process).

Q. Then you say after you get it through the compression you call it *gasoline*?

A. Yes, sir.

Q. Suppose you were to combine one-third naphtha and two-thirds of the commodity after it was compressed, what would you call it then?

A. Gasoline.

Q. Just the same name as you would before?

A. Yes, sir.

Q. Why do you call it gasoline when it is through the compression process? How do you get the name gasoline?

A. Simply as a trade name. (Vol. 1, p. 396.)

League had testified in chief that the commodity was gasoline; and on cross-examination he was asked

if in so calling it he did not make a mental reservation, and he answered, "No, sir." (Vol. 1, p. 433.) Scott testified that they called this product "gasoline." (Vol. 1, p. 461.) Barnhart, of the Franchot Plant, says they called it "gasoline," and that they shipped it under that name. (Vol. 1, pp. 462-3.)

**Use made of product in question after delivered to refinery at West Port Arthur**

What was done with the product after it reached West Port Arthur is explained by Mr. Timmons, who was Pump House foreman, and Mr. Pritchard, defendant's superintendent. Mr. Timmons says that when the cars arrived samples would be taken from them and tests made for gravity and color (Vol. 1, p. 255); that if they received a car that was off color it would be pumped into tank No. 829, which was the *crude naphtha* tank, and the contents of that tank were run through a steam still; but the liquid put into tanks 805, 838, and 857 was not rerun, but was thereafter merely blended; that the number of cars they received from Kiefer, Jenks, and Drumright which were pumped into tank 829 was very small, maybe two per cent (Vol. 1, pp. 255-6); and that not to his knowledge was anything done with the contents of tanks 805, 838, and 857 other than to blend them (Vol. 1, p. 257). *It was conceded by counsel that no shipments described in the indictment went into tank No. 829.* (Vol. 1, p. 259.) On cross-examination Timmons said that the custom shows that if the gravity test was 57 or above, it was called

gasoline (Vol. 1, pp. 294-5); and that there were different specifications for gasoline—northern gasoline, southern gasoline, motor specifications and specifications for the Motor Transport Corps of the United States; aeroplane gasoline, fighting gasoline, used for bombing planes; South Carolina motor gasoline, specifications adopted by the State of South Carolina; and the company had its own standard called "Good Gulf Gasoline," and he thinks there were specifications for gasoline to be sold in Texas. They were all to some extent different. (Vol. 1, pp. 309-10.)

Mr. Pritchard testified that, when an order for gasoline was received with certain specifications, a mixture would be made to meet them, and this was done by pumping from the tanks which contained products of different specific gravities, and other qualities, the mixture being tested from time to time until it complied with the requirements of the specifications. (Vol. 1, pp. 586-7, 589.)

To describe it a little more specifically than the witness:

Say there were two tanks, one of which was No. 805, containing the product shipped from Kiefer, which was of high specific gravity, and another tank containing painter's naphtha, of a very low specific gravity. If an order was received for gasoline specifying an intermediate gravity, it would be filled by pumping from each of the tanks until the specific gravity and other requirements were met, and *this combined product was shipped as gasoline and defendant says it was gasoline; but it contends that a product is*

*not gasoline, and should not be so shipped, unless it meets the specifications of the particular order.*

Citation to the record is probably necessary to substantiate the assertion that such a contention is made. On pages 317-18, Volume 1, counsel for the defendant says:

Our contention is this, that this product is not gasoline until it is a finished product and that——

The COURT. When is it a finished product?

Mr. SWACKER. After this blending or correcting, until it gets down to meet the specifications.

The COURT. You are bringing in other purposes then, although it might be such a product as could be used in some commercial market as gasoline, that until it is blended in this refinery to meet the specifications of the kind of gasoline they put on the market, it would not be gasoline—is that what you mean?

Mr. SWACKER. Yes, sir; we say it is not gasoline, and in (which is) the proper name of the finished product.

On page 590, Vol. 1, Mr. Pritchard says that they don't consider at the Port Arthur refinery any product a refined product until it is a finished one, and that it might be gasoline for one purchaser and not gasoline for another purchaser. And on cross examination he says that what he terms gasoline is the product finished in accordance with the specification of the purchaser, and he doesn't call anything gasoline until it meets the specifications of the man that buys it

for the market; but he says there are different kinds of gasoline, and he might call one South Carolina gasoline and another motor gasoline. (Vol. 1, p. 602.)

In other words, if a wholesale merchant were to order sorghum molasses of a certain consistency, and molasses of a different consistency were shipped, it would not be sorghum molasses.

#### Alteration of defendant's records

Some of the documents delivered to Government's agents for inspection were altered by eliminating therefrom the description "gasoline." The Government's Exhibit No. 77 was part of a record that was subsequently kept on the daily test sheet and shows the number of cars that were received from the different points upon specified dates. It appears that on the dates of December 29, 1916, January 1, January 3, January 8, and January 31, 1917, after each word "Kiefer" appeared the word "gasoline" (Vol. 2, pp. 1297-1298-1300), but this word had been erased (Otey, Vol. 1, pp. 501-3); and it was admitted by counsel that these erasures were made before the document was delivered to the Government's agent (p. 507). That part of Government's Exhibit 80, which appears on pages 1330-1336, was a sheet containing a list of cars and showing outages, etc., for the month of April, 1917. This sheet appears to have been made in duplicate, and the heading had been cut off the one first handed to the Government's agent. In response to a *subpœna duces*

*tecum* the other copy was turned over to the Government during the trial; and that copy is Exhibits 81 and 82. (Vol. 2, pp. 1354-1358.) Exhibit 81 is a letter addressed to defendant's auditor at Pittsburgh and begins, "Our April yield statement will show, as a receipt, 146 cars of *gasoline* from Kiefer," etc.; and Exhibit 82, which is the list attached to Exhibit 81, is headed "Receipts of Kiefer *Gasoline*, April, 1917." (See Stewart, pp. 529-30-31.) The Court of Appeals appears to hold that the effort upon the defendant's agents to conceal their admissions of record that the product in question was gasoline, and was shipped as such, is inadmissible.

**When this rate was published the defendant did not disclose to the carriers its purpose to ship this product thereunder**

This is fully disclosed by the correspondence preceding its publication, and the testimony of those who represented the carriers. The following correspondence appears in the record:

On January 15, 1914, Mr. Ellis, agent for the defendant, wrote Mr. Powers, agent for the St. L. & S. F. R. R. Co., to the effect that the company wanted to move ten cars of *gasoline* from Kiefer to Port Arthur, to be handled in its boats to its eastern distributing station; that he found nothing but a 37¢ rate published from Kiefer to Port Arthur, and asked that it be arranged to publish a 33¢ rate, the same as the northbound rate from Port Arthur, to Tulsa. He stated that if the movement proved satisfactory he was sure there would be more of it, and that he

believed he could induce the Kansas City Southern to participate in the 33¢ rate. (Ex. 85, Vol. II, p. 1363.) On January 18, 1914, Ellis wired Mitchell of the Kansas City Southern:

Requested Powers docket rate 33¢ Kiefer to Port Arthur on *gasoline* for coastwise shipments. He has wired you and Christian for concurrence. Hope you will concur. Answer. (Ex. 90, Vol. II, p. 1366.)

On the following day, January 19, Ellis wired Mitchell:

Exchange telegrams relative 33¢ rate Kiefer to Port Arthur in addition to this southbound rate we are figuring on moving about fifty cars per month or more of *naphtha* Port Arthur to Kiefer have talked with Powers St. Louis long distance and he will make additional request on Leland to-day as separate proposition that same be docketed for San Antonio meeting this will permit of majority cars moving under load both ways want you to favor this and use your influence with other lines am trying to get you long distance. (Ex. 91, Vol. II, p. 1366.)

On the same day Ellis again wrote Powers stating that they were figuring on from 50 to 75 cars of *naphtha* per month from Port Arthur to Kiefer, and that he found the existing rate of 43¢ per 100 pounds was prohibitive, and requested a 33¢ rate; that there was then a 33¢ rate on *refined petroleum and its products* from Port Arthur and West Port Arthur to Tulsa, and that they should have a rate not to

X
1
 exceed that rate to Kiefer, and that "This naphtha is being moved from Port Arthur to Kiefer to be further refined at that point in connection with products now at Kiefer and *the outbound shipments will consist of gasoline*, and for each car of naphtha moved into Kiefer there is approximately *two cars of gasoline* outbound"; and he asked that the matter be quickly disposed of, adding, "This is absolutely new business." (Ex. 92, Vol. II, p. 1367.) This letter related solely to northbound shipments, and the writer did not hesitate to state just what the product was, and what would be the resultant product after treatment at Kiefer. Whether anything came of the application at that time is not disclosed; but on January 19, 1915, Mr. Christian, representing the Sunset Central Lines, wrote Mr. Ellis with reference to an application made in a conversation on the previous day for 15¢ rate on naphtha from Port Arthur to Kiefer, saying:

In view of this commodity *having passed beyond the crude state* it necessitated giving consideration to a reduction in the refined product. The current maximum rate between Texas points on refined oil is 25¢, which figure we indicated should at least be the minimum from Port Arthur to Kiefer. Definite advice has now been received indicating application of Texas lines to the Railroad Commission of Texas contemplates minimum rate on refined oil of 30¢ per 100 pounds; therefore it is wholly inconsistent to establish from Port Arthur to Kiefer a lower figure, as by so doing

it would jeopardize our application to the Texas Commission, thus limiting our earnings on the entire traffic moving between Texas points. (Ex. 93, Vol. II, p. 1368.)

And he suggested that as the existing rate was 33¢, and the conditions precluded the publishing of less than 30¢, it had occurred to him that he, Mr. Ellis, would not insist upon a disturbance of the rates for such a small difference. (Ex. 93, Vol. II, p. 1368.) The statement that the naphtha moving north "had passed beyond the crude state" is important, because it shows that the agents of the carriers could not have regarded the product in question as "unrefined" naphtha. On February 9, 1915, Mr. Ellis wrote Mr. Christian and also Mr. Reilly of the Frisco Lines:

I have gone into this matter from all angles and am going to ask that you arrange for the publication of 30¢ from Port Arthur to Kiefer and 30¢ Kiefer to Port Arthur, and 25¢ from North Fort Worth to Kiefer and from Kiefer to North Fort Worth, applying on naphtha and gasoline. (Ex. 88, Vol. II, p. 1365.)

The designation "gasoline" undoubtedly refers to the product in question, as the record shows that it is the only product moving south from Kiefer to Port Arthur to which such a name could apply. On March 18, 1916, Reilly wrote Ellis:

Your application has been given careful consideration, and this is to advise that in view of the present conditions, that of our traffic not yielding sufficient revenue to pay cost of operation and the further fact that we are

now endeavoring to increase rather than reduce rates, it will be impracticable to establish the rates at this time which you propose. (Ex. 89, Vol. II, pp. 1365-66.)

On May 29, 1916, Powers wrote Ellis:

Some one has suggested cancellation of item 2546-B, Supplement 40, SWL Tariff 26-T, offering as an excuse that continuation of this figure may jeopardize rates of 27 and 39 cents, respectively, to Texas common point territory. We shall be governed by your requirements in the premises as to the cancellation of item 2546-B and shall thank you to fully advise by return mail. (Ex. 86, Vol. II, p. 1364.)

It was admitted that that item referred to a rate on gasoline southbound from Kiefer and elsewhere to Port Arthur, Texas. (Vol. 1, p. 366.)

On June 5, Ellis replied:

We do not want this rate canceled, as it is in daily use. We are now moving about 18 cars per week on this rate. (Ex. 87, Vol. II, p. 1364.)

On May 16, 1916, Ellis wrote Reilly confirming a wire requesting a 17¢ rate applying north and south between Port Arthur, West Port Arthur, and Kiefer, and described the products to be moved as follows:

All of our products from Port Arthur and North Fort Worth is an unfinished product *and is passed through the refinery at Kiefer; and the product secured from this partial refining at Kiefer is an unfinished product*

and is transported to our Port Arthur refinery, and at that point *further refined*, and we are entitled to the unrefined rate as outlined above. (Ex. 97, Vol. II, pp. 1376-7.)

And on the same day Ellis wired Reilly:

Will you please arrange through Southwestern Committee for publication seventeen cent rate *crude unfinished naphtha* Port Arthur West Port Arthur to Kiefer and Kiefer to Port Arthur West Port Arthur and twenty cents from North Fort Worth to Kiefer and Kiefer to North Fort Worth on same relative basis now published in item thirty twenty two half supplement forty one Leland's twenty-six tee. (Ex. 98, Vol. II, p. 1377.)

The description given in this letter and telegram would certainly not put an agent on notice that it was expected to ship under the rate applied for a product containing no impurities, and which was sold and shipped as gasoline when mixed with a similar product to reduce its specific gravity.

But Mr. Powers testified that he conversed with Mr. Ellis, and that Ellis explained "that it was a low-grade article to be shipped and treated and re-shipped" (Vol. I, p. 565); and the witness also stated that he had then had no experience in refining or in the products made by refineries (Vol. I, p. 566). Mr. Reilly (improperly addressed as Mr. Powers) testified that he thinks the wire to him from Ellis dated May 16 (Ex. 98, Vol. II, p. 1377) related to the publication of rates from Oklahoma to

Baton Rouge, and the following colloquy passed between the court and the witness:

The COURT. Now, do you know? Did you know or go on the representations of the statements made there, or did you know of your own personal knowledge?

A. *We followed the statements of the tariff preceding us from the other Oklahoma producing points. Reproduced what was ahead of our line.*

The COURT. You took the statement what they wanted to put on was the same product these items covered?

A. We did not necessarily take this statement. We were requested to put in a rate on crude naphtha or unrefined naphtha or unfinished naphtha, I do not recall which. We put it in on the regular basis.

The COURT. Without any investigation of what it was?

A. Well, your honor, that is impossible. We can not go out into the field. We don't know what is being shipped. We are hundreds of miles removed from the shipping point. (Vol. 1, p. 571.)

And this witness further testified:

*In establishing the rate from Kiefer, we had in mind the tariff rate that had been published from Oklahoma and Kansas to Baton Rouge.*

The COURT. And the decision of the Interstate Commerce Commission?

A. *That was carried by the lines originally in publishing the rate to Baton Rouge. If I may*

be permitted to explain the rate-making basis—

The COURT. Now, I will just permit you to state that you had those before you when you did that.

Q. Well, in the establishment of the Baton Rouge rate you had the Commission decision as a basis; is that correct?

A. Yes, sir.

Q. That was the case, also, as to the Coffeyville rate, established some years prior?

A. I don't recall, the Frisco not being a line between Muskogee and Coffeyville, whether we established that rate.

Q. But in the establishment of the Baton Rouge rate, you had the order as the basis for the establishment of the Baton Rouge rate?

A. The guiding point of the railroads in publishing the rate on naphtha.

The COURT: After rates were made, then it was up to the shippers to ship in accordance with them?

A. Yes. (Vol., I pp. 574-5.)

It appears, therefore, that the rate in question was based on the rate then existing from Oklahoma points to Baton Rouge, and that rate was based on the rate from Muskogee to Coffeyville, which was fixed pursuant to the opinion of the Interstate Commerce Commission in *National Refining Company v. Missouri, Kansas & Texas R. R. Co.* (23 I. C. C. 527). And the Court of Appeals in its opinion declares that—

In the light of the ruling of the Interstate Commerce Commission in the *National Refin-*

ing Company case, the rate on unrefined naphtha theretofore given by one of the carriers to Baton Rouge on a commodity *shown to be substantially the same as the condensate of the Gypsy Company's plants*, and the testimony in this case, we think the insistence (that the conduct of the defendant was fraudulent) groundless and must have been highly prejudicial. (Vol. II, p. 1690.)

That the finding of the court that the product here shipped *was substantially the same* as the product there considered by the Commission is wholly unjustified and erroneous is perfectly apparent from the description of the product given by the Commission in its opinion. A certain product was shipped from Muskogee to Coffeyville, and the railroad charged the rate applicable to *refined* oil, and the petitioner claimed it should have been transported at the rates applicable to *crude* oil. The Commission first mentioned the product as "a certain distillate of petroleum oil consisting of the lighter ends of the crude oil" (Ex. 99, Vol. II, p. 1378); and in describing it the Commission said:

The product that was shipped seems to have no distinct commercial designation or trade name; by complainant it is referred to as "crude product"; one of the shippers described it in the bills of lading as "crude benzine"; the carriers classed it as refined oil. The evidence shows that the crude oil had undergone a skimming process and that this commodity was one of the two resulting products. The

Muskogee crude, as it comes from the well, has too low a fire test to be salable as fuel oil; by the skimming process the lighter ends of the oil are extracted, and the heavier residue becomes marketable as fuel oil.

This skimming process is accomplished by distillation carried just far enough to separate the lighter from the heavier oil, the former amounting to about one-fourth part of the oil. The extracted product, though not separated in accordance with any specifications, may, therefore, properly be roughly described *✓ as a light-end distillate*, and that designation will be used in this report. It was this product that was shipped, and complainant's testimony was to the effect that *it had no commercial value except for refining purposes; that at complainant's refinery it was kept separate from the crude oils and refined into gasoline, naphtha, turpentine substitute, and a residuum sold as fuel oil.*

For refining purposes this light-end distillate commanded a higher price than the crude oil from which it was extracted. Complainant's president testified that the price of the Muskogee crude oil at the time of purchase was 2 cents per gallon; he was not certain, but thought he paid 3 cents for the light-end distillate. The information of defendants was to the effect that the price was  $3\frac{1}{4}$  cents. Complainant's president testified that, at the time of this purchase, he was in special need of material for lighter-end products, and for this reason was willing to pay a price higher than is customary for this distillate. Under

ordinary circumstances it would be more profitable to use a straight crude oil. (Vol. II, pp. 1380-1.)

It was held that neither rate was applicable, and that a reasonable rate would not have exceeded by more than two cents the rates applicable to crude oil; and that relationship was established for future shipments. *The product there in question was practically worthless until it was refined and converted into other products. In fact it was crude naphtha, or the "naphtha fraction" heretofore described, which by distillation is separated into gasoline, benzine, and painter's naphtha.* If it was not the exact equivalent of the "naphtha fraction" described, it was not so valuable, because a less per cent was separated from the crude oil by the skimming or light distillation process used.

Therefore the railroads had no intention in publishing a rate on "unrefined naphtha" to carry under that rate a blend of casinghead gasoline and painter's naphtha, a product resulting from the distillation of "crude" or "unrefined" naphtha.

#### Testimony of experts

The defendant introduced a number of experts who testified very fully upon the following subjects:

##### What is Gasoline

Mr. Tabor explained in detail how crude oil is refined, and said that in the early days of the industry about one-half of one per cent of the crude oil was converted into gasoline, which was used by country people for lighting their houses; and that for a long

time that was the only substance called gasoline. This continued until automobiles came in use, and thereafter it was used in different mixtures. He then proceeds as follows:

And that continued until by and by the automobiles came along so fast it run the gasoline—there wasn't gasoline enough to supply them and then they had to go to the naphtha to get something heavier, *but they called that gasoline*, because the people who used gasoline knew nothing about the designations, proper designations, of petroleum, and their carburetors at that time had been made to use this very light material; so the people that had the material didn't know it was naphtha; *they called it gasoline*. Then the manufacturers had to make their carburetors so they would burn the heavier material, until finally, in 1885, according to the census report, where one part in thirty was naphtha, the whole naphtha product was prepared, that is, thirty parts of naphtha, *and they called it gasoline*, and more than that, they put some kerosene in it, and that meant the automobile people had to change their carburetor to burn heavier and heavier material, *but they still called it gasoline*. That is the proper name for it isn't gasoline, *from the technical standpoint*. (Vol. 1, pp. 672-673.)

And in defining gasoline, he testified:

Gasoline in the strict technical sense of the word is the product which is substantially 76 to 80 gravity (exactly the gravity of the product in question) as described and refined

✓ distillate from petroleum which is suitable for use in carbureting air for making a gas suitable for burning in private dwellings.

Q. That is what the article of commerce known as gasoline is?

A. That is *one* of the articles of commerce known as gasoline for that particular purpose; *that is the original name. Now, there are other articles of commerce, and that is what has been developed by the automobile business.* For that purpose we will say that

gasoline is a product, a combination of products of naphtha produced from crude oil, natural gas, casinghead gas, and other source which are made suitable for use in the general run of automobiles which use suction carburetors. It has to be suitable for such use, that is not material that will run one make of car but any make of car that comes along equipped with the ordinary suction carburetor to-day. (Vol. 1, p. 678.)

And in response to the question whether the material produced at Kiefer and Drumright was gasoline, he says:

It doesn't fulfill either of the specifications for gasoline which I have given. I do not consider it gasoline. I consider it unrefined naphtha. (Vol. 1, p. 678.)

The expert Burrell, when asked to define gasoline, says:

I prefer to define gasoline as a liquid inflammable substance or mixture of hydrocarbons suitable for use in an automobile engine of to-day. Now, I should say that

certainly over ninety-five per cent of the gasoline that is used to-day is used in automobile engines. A small amount is used in making gasoline gas for lighting isolated residences, and similar places, and a small amount is used in stoves. Perhaps a better definition would be, an inflammable liquid, a mixture of hydro-carbons suitable for use in any kind of vaporizers. (Vol. 1, p. 691.)

So, while Tabor thinks a product should be called gasoline if it will run *all makes of automobiles*, Burrell thinks it should not be so called unless it is also suitable for use in vaporizers used for *all other purposes*. If this be the correct definition there is no such thing as gasoline, because it is apparent from Tabor's evidence that there is no product that can be successfully used in all kinds of vaporizers. According to this theory oil used to lubricate watches is not oil because it can not be successfully used to lubricate farm tractors.

Burrell further says that there is a great deal of confusion in the nomenclature of the petroleum industry, more in the popular mind "than in the scientific literature, although in the literature some confusion exists." (Vol. 1, p. 692.) And after testifying that the product shipped from Kiefer, Jenks, and Drumright to Port Arthur is not gasoline, he says:

*It is very popularly called gasoline—I have so called it myself.* (Vol. 1, p. 694.)

And he admits that in a book written by him he used the word "gasoline" almost entirely, but on practically the last page the statement is made that

the word "gasoline" as used therein is very loosely applied, and that the material under consideration does not come under that category until properly prepared for market. (Vol. 1, p. 694.)

The expert Garner testified that in the strict technical sense gasoline "*would be that low boiling portion of naphtha having a gravity from 76 possibly to 82 and usable for the purpose of illumination.*" This is an exact description of casinghead gasoline. He finally says, however, that gasoline is a term applicable to products of petroleum to be used for vaporization purposes; and as a commercial term relating to an article of commerce it is a finished product as distinguished from an unfinished one; and he does not consider it properly can be called gasoline unless it can be used for vaporization purposes, such as running a car or in a gasoline stove; and that the product in question is not in any proper sense gasoline. (Vol. 1, pp. 710-11.) He sticks to this statement after it was demonstrated that it would successfully operate a Pierce-Arrow car (Vol. 1, p. 846), because he says:

A Pierce Arrow car is a very exclusive car; it is not a car that represents any very considerable portion of the great percentage of the cars; that is the first one, it is not a car in common usage. It is used by people who are very wealthy. In the second place, it is a car that is nearly mechanically as correct as a car can be built. (Vol. 1, p. 850.)

The witness does not, however, undertake to point out exactly what kind of a car must be perfectly

operated and how wealthy its users must be before the fuel with which it is operated can be properly designated as gasoline. Manifestly, according to Doctor Bacon, the fact that a fuel will operate a Ford is no evidence that it is gasoline, because he says "a Ford will almost run on rainwater." (Vol. 1, p. 765.) But Doctor Garner does not agree with Doctor Bacon with reference to the superior virtues of a Ford. (Vol. 1, p. 850.)

Doctor Schock says that "gasoline is a material or substance that is not definable in just a few words"; and again, "The material used to-day under the word gasoline is not identical with the material that was called gasoline years ago." He further says:

There is a gasoline that existed at that time. It was used in gasoline stoves and that was and did not differ exceedingly from the present gasoline, but in another way it does. The quality and the volatility has been steadily lowered in order to meet the greater demand that at one time the time that your honor refers to gasoline it was a product that was not exactly the same; I won't say that twenty years ago gasoline was a different material, but it was a gasoline that had a lower boiling point, was more volatile as a whole than the present gasoline. (Vol. 1, pp. 718-19.)

The expert Miller says:

Gasoline I define as being generally that fraction of crude petroleum or similar products lying within the range of boiling point

and other necessary physical tests which will *satisfactorily and economically* operate an internal combustion motor. (Vol. 1, p. 738.)

This expert introduces another element which he appears to regard as essential for a fuel to be defined as gasoline, and that is that it will operate a motor *economically*.

Dr. Bacon says:

My definition for gasoline would be this, gasoline is a mixture of combustible liquids, a finished product that will *satisfactorily* run a motor car. (Vol. 1, p. 750.)

He does not add "economically"; but presumably the operation would not be satisfactory unless it was economical. And after explaining how the use of automobiles has dominated the petroleum industry, he says:

Consequently, I am inclined to believe if anything would come along to-morrow that would properly run an automobile engine and it was derived in large part from petroleum, *that that material would properly be called gasoline*. (Vol. 1, p. 751.)

And—

I haven't any doubt that in the next three or four years, possibly sooner, new material will come in, and if those materials go in with petroleum distillates, *I believe that that product is correctly called gasoline*. (Vol. 1, p. 751.)

And he further says:

I thought a great deal since this case came up, what a proper definition of gasoline was,

and it is very difficult to make one. (Vol. 1, pp. 751-2.)

According to this definition, kerosene is gasoline, because practically all tractors and some motor cars are operated with kerosene.

Whether the product in question should be defined as "unrefined naphtha"

While stating that "unrefined naphtha" is an appropriate name, Doctor Burrell adds:

If I had been asked to select a name for this I don't say I would have used unrefined naphtha, perhaps unfinished naphtha, but I will say unrefined naphtha is a proper name and gasoline is a wrong name. (Vol. 1, p. 694.)

But he really likes the word "condensate" in speaking of natural gas gasoline. (Vol. 1, p. 695.)

And he finally says:

I will admit that this natural gas gasoline is a very fine material; it has helped out the automobile industry; it is very valuable, but casinghead gasoline helps the naphtha just as much as the naphtha helps the other. They are invaluable to each other. You can not say that this material is not high grade (I don't mean it is low grade). It is a very valuable commodity.

Q. Now, in what respect is it unrefined?

A. It is not ready for the market. (Vol. 1, p. 708.)

And Dr. Miller says:

I consider it a proper designation, the name of unrefined naphtha; *I might personally want*

*to call it something else, to be a little more descriptive.*

Q. What would you call it?

A. *As unfinished naphtha or unfinished gasoline blend or unfinished casinghead blend or unrefined casinghead blend.* (Vol. 1, p. 741.)

Doctor Burrell admits that he never used in any of his works the term "unrefined naphtha" (Vol. 1, p. 706), and he also admits that in a paper prepared by him entitled "Technology of Natural Gas as Applied to Making Gasoline and Absorption Processes" he says, "as a matter of fact, blended casinghead gasoline finds thousands of satisfied users." (Vol. 1, p. 706.)

Dykema, an expert introduced by the Government in rebuttal, who had formerly been connected with the Bureau of Mines, testified that he had never seen casinghead gasoline called by the name of "unrefined naphtha" in any of the technical works that he had read, and that while he was connected with the Bureau of Mines he had visited every casinghead field in the country, and that he had never heard the product in question called "unrefined naphtha" (Vol. 1, p. 856); and that the product produced by compression of natural gas should be called gasoline regardless of gravity; and that he had never anywhere heard it called "unrefined naphtha" prior to the beginning of this suit (Vol. 1, p. 840).

De Barr, another expert introduced by the Government in rebuttal, testified that casinghead gasoline is not properly designated "unrefined naphtha"

(Vol. 1, p. 879); that it is perfectly refined when it comes from the earth; that the fact that it is blended in order to lower its gravity does not justify calling it "unrefined naphtha," and that he has read many scientific works on the subject and he knows of none that so defines casinghead gasoline (Vol. 1, p. 881).

#### What constitutes refining

The defendant's experts, Taber and Burrell (Vol. 1, pp. 689-90), both testify that the blending of casinghead gasoline with naphtha to produce a mixture that will meet specifications is a process of refining. Taber says:

The ordinary meaning of refining is to purify, make fine, remove extraneous matter; remove things that don't belong in the matter. (Vol. 1, p. 680.)

He illustrates by supposing that one is allowed in shipping grain to permit one pint of chaff to be shipped with every bushel. If one had a bushel of grain that contained a quart of chaff he could do either of two things, take out a pint of chaff or put in another bushel of wheat. (Vol. 1, pp. 680-1.) However, this illustration does not apply to the product here in question, because there is nothing to be taken from either the casinghead gasoline or the naphtha with which it is mixed. Both are already in a refined condition; and the sole purpose of mixing or blending is to get a substance that will meet specifications as to chemical and physical quality. An exact illustration would be to suppose that a miller orders

wheat that will produce flour having specified qualities. The dealer has some wheat too soft and other wheat too hard to produce the flour desired. But he complies exactly with the order by mixing the two kinds of wheat in proper proportions. By so doing does the dealer "refine" the wheat? And isn't each variety "wheat", and must it not be shipped as "wheat," though that particular order can not be filled with either of the varieties?

+ The Government's expert Dykema says that blending of the two products is not a refining of casinghead gasoline, but merely mixing. (Vol. 1, p. 856.) And Doctor De Barr says that the blending of casinghead gasoline with refined naphtha does not tend to refine the gasoline. (Vol. 1, pp. 880-1.)

Dykema says that casinghead gasoline is refined in the ground, and he explains the process (Vol. 1, pp. 833-34), which he describes as practically the same process that is carried on in a still (Vol. 1, pp. 837-8.). The defendant's expert Burrell says that casinghead gasoline "is essentially the result of a distillation operation in the ground."

The COURT. Then there is a process of refining in the ground?

A. That is one of the processes of refining; yes, sir. (Vol. 1, p. 693.)

#### **Experiment with product in operating cars**

The expert, Burrell, in his examination in chief, describes his experience in endeavoring to operate a Packard and also a Dodge car with, first, casinghead

gasoline, and then with the blended product; and in experimenting with the Packard he says they put some curb gasoline in the carburetor, but it ran only about a hundred yards and stopped, and they had the same experience with the Dodge car (Vol. 1, p. 698). But he unconsciously gave an explanation of just why these machines did not operate. On cross-examination he makes the following explanation of a passage which appeared in an address previously delivered by him:

Q. In that work did you say, "Natural-gas gasoline is not only valuable because of the product itself, but because it is of very high grade—so high, in fact, that it is not economical to use it alone, but so it is mixed with low-grade refinery naphtha and the so-called cracked gasoline, a great deal of which is being made at the present time"?

A. I did, and I will tell you what I meant by the term "high grade." *Automobile makers have changed their carburetors, as fuel became scarcer and scarcer, until to-day that carburetor is made to suit a much more lower-grade fuel than the high-grade fuel of a few years ago; so to-day the low-grade fuel is a high-grade fuel, because that high-grade fuel of a few years ago will not operate an automobile satisfactory.* (Vol. 1, p. 707.)

On cross-examination he admits that he did not adjust the carburetor. (Vol. 1, p. 802.) *Therefore his whole trouble was due to the fact that the grade of fuel was too high for the carburetor as adjusted.*

In rebuttal the witness Downing testified that for six years he made it a practice to use casinghead gasoline to operate a car. (Vol. 1, p. 813.)

Dykema describes a test which was made during the trial. *The fuel first used was strictly casinghead gasoline so weathered as to make it as near as possible like the gasoline that had been shipped from Jenks.* The experiment seems to have been made by parties representing both sides. Both a Packard and a Pierce Arrow were used; and they were put in condition satisfactory to representatives of both sides, and the witness Dykema rode in the Pierce Arrow. He said it started without any difficulty, but stalled at a point about seven miles from Jenks toward Kiefer; and after relieving the pressure and cooling the engine somewhat they started, and went to a point within a hundred yards of the plant, and after again relieving the pressure they drove in. No adjustment whatever had been made of the carburetor; and it was his opinion that if it had been adjusted the car would have run steadily. (Vol. 1, p. 829.)

*At Kiefer employees of the plant made a blend of thirty per cent naphtha and seventy per cent gasoline, which was weathered down with steam in the same manner it was weathered at Jenks, until it reached a vapor pressure which was similar to that mixed for shipping.* The cars were then drained to the satisfaction of representatives of both parties. He says the car "*Didn't make a single stop,*" and *they had no trouble whatever with the engine. They*

made the 19 or 20 mile trip between 12.20 and 1.03, and sometimes ran 35 miles per hour, as fast as they regarded it safe. (Vol. 1, pp. 830-1.) There is no testimony with reference to the operation of the Packard, in which apparently the defendant's representatives rode. Presumably, therefore, there was no trouble in the operation of that car.

The Government's expert, De Barr, testified that three years previously he drove a Ford car several hundred miles on compression gasoline, and also drove a Dodge roadster with compression casing-head gasoline a week or two. He used casinghead gasoline because the company was letting him have it for nothing. (Vol. 1, pp. 882-3.) He thinks, however, that because of its volatility he would not let his wife use it unless she were first familiarized with it.

#### Definitions of gasoline

The Standard Dictionary defines gasoline as:

A colorless, volatile, inflammable product of the distillation of crude petroleum, having a specific gravity of .629 to .667 (95° to 80° B.). It is used as fuel in vapor-stoves and for carbonizing air and water-gases.

We find *gasoline* in use in our State in the hands of persons who do not know that the vapor arising from it, when mixed with the atmosphere in the proper proportion, is one of the most dangerous explosives.—Rep. Sec. of Mich. St. Bd. of Health, '88, p. 200 (89).

Webster defines gasoline as:

A volatile, inflammable liquid used as a solvent, for oils, fats, etc., as a carburetant, and to produce heat and motive power.

The Century Dictionary definition is:

A volatile liquid product commonly obtained from the distillation of petroleum. Its specific gravity is .629 to .6673 (95° to 80° B.). Used for saturating air or gas in gas-machines or carburetors, and in the engines of motor vehicles.

The Encyclopedia Americana states that the specific gravity of gasoline ranges from 58 to 90.

Casinghead gasoline is a distillate of crude petroleum, the distillation taking place by natural processes in the earth. (Vol. 1, pp. 837, 880.) In the earth, the oil is under a pressure, commonly called rock pressure, which raises the boiling point of the various components of the oil and causes the formation of a gas, called casinghead gas. The condensation of this gas produces gasoline which is in a pure, refined condition and which needs no refining. (Vol. 1, pp. 837-839.) It is a high gravity gasoline, its gravity, as it comes from the compressors (prior to blending or weathering) being as high as 88° to 90° B. (Vol. 1, p. 242.) Blending and weathering reduces the gravity to as low as 60.9 B. It thus appears that the commodity shipped by the defendant is strictly in accordance with the dictionary definition of gasoline, which must be taken as the common acceptance.

## CONCLUSIONS OF FACT

From the foregoing evidence the following inferences of fact must be drawn:

1. That before the advent of the automobile the only product known as "gasoline" contained the same specific gravity, and possessed substantially, if not exactly, the same characteristics as the product which defendants shipped as "unrefined naphtha."

2. That from the enormous demand for fuel that will vaporize and explode caused by the development of the gasoline motor, there has been produced a number of varieties or grades of such fuel, all possessing the same general characteristics, and so far as this record shows the same chemical elements, but differing in volatility, some kinds being better adapted to certain makes of vaporizers than to others; that the quality of the fuel depends primarily upon its specific gravity, and the quality desired by a purchaser is obtained by blending those having different gravities; that the product in question has a high specific gravity and is a high-grade fuel; *and that all varieties of this class of fuel have always been known in common parlance as "gasoline," and so designated in all treatises upon the subject, except now and then a writer has suggested that the name did not apply in its technical sense.*

3. That defendant always called this product "gasoline" in its correspondence, and shipped it as gasoline up to the time the "unrefined naphtha" rate went into effect, and continued to so bill and ship it elsewhere than to West Port Arthur.

4. That no other producer supposed that the "unrefined naphtha" rate had any application to this product, and all of them continued thereafter to bill and ship it as "gasoline," the defendant being the only producer that ever at any time billed and shipped it under any other designation than "gasoline."

5. That in the common parlance of the trade, as well as by shippers, except by defendant after December 2, 1916, it was always known as "gasoline."

6. That it has never been called by any one at any time, in either common parlance or in scientific works, "unrefined naphtha," except in connection with shipments made by defendant to West Port Arthur after December 2, 1916.

7. That defendant's own experts, while saying it will answer to the name "unrefined naphtha," yet clearly regard some other designation, such as "unfinished naphtha," or "a distillate," as preferable.

8. That in fact it is not "unrefined naphtha" in any sense of the term. It is not "naphtha"; but is either casinghead gasoline, which is not known as naphtha, or a blend of such gasoline and painter's naphtha. And it is certainly not "unrefined." The painter's naphtha is the product of double distillation, one separating the "naphtha fraction" from the petroleum residuum, and the other separating the crude naphtha, or "naphtha fraction," into three elements commonly known as gasoline, benzine, and painter's naphtha, each of which is a *perfectly* refined product. And the casinghead gasoline has been

refined first in the earth, and then by eliminating the moisture and the more volatile elements by weathering and compression.

9. That the product is really gasoline. It contains the same constituent parts and the specific gravity and color of the original highly volatile gasoline, and vaporizes and explodes as gasoline, and will operate some makes of cars reasonably well without readjustment of carburetors, and could be successfully used in operating any car if equipped with a suitable carburetor.

10. That defendant instigated the publication of the rate on "unrefined naphtha," intending at the time to take advantage of it and ship under that designation this product which had always theretofore been known and shipped as "gasoline"; and

11. That the railroad companies understood when the rate was put in that it would apply to crude naphtha, or a product similar thereto, to wit: the product the Interstate Commerce Commission had considered in *National Refining Company v. Missouri, Kansas and Texas Railroad Company*. (Rec. Vol. 2, p. 1378.)

#### **Legal principles controlling application of rates**

This product had to be shipped from Kiefer, Drumright, and Jenks to West Port Arthur either as "gasoline" at a 33-cent rate or as "unrefined naphtha" at the 19½-cent rate. It could not legally be shipped under both rates. If the 19½-cent rate is applicable, the railroads discriminated against all

the other producers, and are liable to them to the extent of the discrimination, and are subject to prosecution for exacting an excessive rate. Under the

statute there can not be two rates on the same product between the same points over the same lines at the same time. *National Elevator Company v. Chicago, M. & St. P. Ry. Co.*, 246 Fed. 588, 592.

That rate is applicable in which the commodity is the more accurately described; and the question is, which designation is the more appropriate for the commodity defendant was shipping, "gasoline" or "unrefined naphtha?" That is a question of fact for the determination of the court, if there is no conflict in the evidence, or if the name of the article is so well known that no doubt can exist that one designation and not the other must apply. If, on the other hand, any doubt does exist as to which is the true name, the question must be determined by the jury. The important question here is, by what rule is it to be determined whether this commodity is more accurately described as "gasoline" or "unrefined naphtha?" Is the opinion of experts as to what *should* be called "gasoline" and what an absolutely scientific and technical definition should be to be treated as conclusive, or is at least consideration to be given to what those who produce, handle, ship and consume gasoline understand that word to mean? If any weight is to be given to such understanding, there was a question of fact for the jury. And furthermore, if but one inference can be drawn from the evidence, and that inference is that this commodity

was known as "gasoline," and not as "unrefined naphtha," in the common language of the trade and by those engaged in shipping it, we insist the trial court should have told the jury that the commodity was "gasoline;" and that no harmful error could be committed by the court in the admission of evidence, or in his charge to the jury, or in refusing to charge requests presented by the defendant, or by counsel in presenting the Government's case to the jury.

The following authorities correctly illustrate the rule by which the question of fact should have been determined.

In *Ohio Foundry Company v. Pittsburgh, Cincinnati, Chicago & St. Louis Railway Company*, 19 I. C. C. 65, 66, the question was, what rate was applicable to shipments which consisted of mixed carloads of articles claimed by the railroad company to be "gas grates," but which the Foundry Company claimed to be "gas fireplaces and grates, and iron fireplaces and grates designed for burning coal." There was a rate of \$1.45 on "iron fireplaces and grates for same, n. o. s., made of wrought or cast iron, also furnace grates, *gas grates* (boxed or crated); portable fireplaces and portable steam radiating mantels; iron linings; grate dampers, andirons (iron), o. r. b., and chafing," and a rate of \$1.35 on "iron fireplaces and grates for same n. o. s., made of wrought or cast iron; also furnace grates," and the same rate on "portable fireplaces and portable steam radiating mantels, o. r. b." Evidence was taken showing that fireplaces and grates for the use of gas were made in the

same factory that made fireplaces and grates for the use of coal and wood; that they were of the same make and style, were shipped in crates of about the same dimensions, and that they were shipped in the same cars and from and to the same points. In passing upon the question, the Commission said:

The evidence shows that "gas grates" is a trade name which has reference to and includes fireplaces made of iron for the burning of gas. We do not think that the declaration by the shipper in the invoices that the shipments were "gas grates" is conclusive of the question of what the shipments actually were. The tariff application is to be construed with reference to what articles actually comprised the shipments. There is no question that the shipments were mixed carloads of gas fireplaces and grates and coal fireplaces and grates. It is admitted by defendants that, if the shipments were fireplaces and grates for the use of coal or wood, the \$1.35 rate should be applied, but, it is asserted, that the fact that they contained gas grates removes them from the class taking the lower rate.

And it was held that the lower rate applied.

In *Pacific Coast Biscuit Company v. Oregon Railroad & Navigation Company*, 20 I. C. C. 178, 180, the Commission had under consideration what rate should be applied to a shipment of paper waxed with paraffin and used as an inside lining for cartons containing crackers and an outside wrapper for protection against moisture on packages exposed to a moist or damp climate. A rate of \$1.20 was applicable to

"Paper . . . wax or gummed paper" and also a rate of \$0.75 on "Paper. Wrapping paper, n. o. s." Evidence was introduced to show to what use this paper was put, and what was meant by "wrapping paper," and the names by which the paper in question was known. In deciding that the higher rate applied, the Commission said:

As a matter of tariff interpretation, we are constrained to hold that a specific rate having been established on wax paper, defendants were compelled to apply that rate to all grades and qualities of wax paper regardless of the use to which it was put. Although this paper was admittedly used in part as an outside wrapper, it is clear that it is a wax paper as *that term is understood in the trade*, and it follows that the proper rate, under the tariffs in force, was applied by the carriers.

In *Western Mantle Company v. Spokane, Portland & Seattle Railway Company*, 20 I. C. C. 643, 645, the shipments in question consisted of material for use in the manufacture of gas mantles. In the freight bill the commodity was designated by the delivering carriers as "knit goods," "knit dry goods," "gas-mantle fabrics," "mantle gauze," and "dry goods," and in the invoices rendered by the manufacturer it was uniformly described as "mantle fabrics." The evidence showed that the shipments consisted of cotton knit fabrics or knitting-factory products used by the complainant as foundation material in the manufacture of gas mantles, and was referred to in the

trade generally as "knitting," but sometimes as "netting." There was a rate of \$2.20 on "netting, cotton, n. o. s., in boxes or bales," and a rate of \$3 on "dry goods, n. o. s., in bales or in cases." The carrier had collected the higher rate. After discussing the evidence, the Commission said:

In our opinion the commodity shipped was not cotton netting, *as that article is commonly known to the trade*; and, as a matter of tariff interpretation, we are of opinion that the term "netting, cotton, n. o. s.," is not properly descriptive of the shipments. In the absence of a provision specifically covering the commodity it was properly classed by the carriers as "dry goods, n. o. s.," and the lawful rate was applied.

In *Chicago, B. & Q. R. Co. v. Feintuch*, 191 Fed. 482, 488 (C. C. A., 9th Circuit), the question was whether show cases were furniture within the meaning of railroad tariff. On application to the Commission by the shipper it had been held that show cases fell within that description, and reparation was awarded, and this action was brought to recover the amount due as found by the Commission. The Court of Appeals said:

The witnesses are in hopeless discord in their opinions—experts on tariff rating, some of them are—touching whether show cases are articles of furniture. It seems to be conceded that show cases fall within the dictionary meaning of the word "furniture," *which would*

be the common acceptance. The Century Dictionary gives this definition:

"Furniture. (1) In general, that with which anything is furnished or supplied to fit it for operation or use; that which fits or equips for use or action; outfit; equipment; as, the furniture of a war horse, or of a microscope; table furniture . . . (3) Collectively and specifically—(a) Those movables required for use or ornament in a dwelling, a place of business or of assembly, etc."

Formerly, and even now, show cases of a certain type rested upon counters in business places, not in any way affixed thereto, and were used for the display of articles of merchandise kept for sale. More recently these cases are made to extend to the floor, and are used for the display of articles of merchandise and also for counters over which goods are sold, but, as we understand, are not in any way affixed to the floor or building, and hence can not be termed fixtures in any sense. They are "movables," and may be shifted from place to place, or even removed from the place of business, without the necessity of detaching them. In this sense, show cases are properly classified as furniture, and that, being the common acceptance of the term, should prevail over any technical meaning the word has acquired by tariff usage in the construction of tariff schedules. The schedules are published for the information of the public in general, who are not supposed to be cognizant of technical usage in rate problems, and it would be a snare to the unwary and uninformed to construe and interpret tariff sched-

ules by any such technical standard. It follows that the tariff in the present instance was properly interpreted.

*Lakewood Engineering Company v. New York Central R. Co.*, 259 Fed. 61, 62, 63 (C. C. A., 6th Circuit), was an action brought to recover a judgment for the payment of an excessive rate. The higher rate was upon "Tracks, portable railway, set up in sections," and the lower rate upon "New iron and steel rails and iron and steel railroad crossties, for export only." The articles shipped consisted of "two steel rails in parallel position, steel crossties riveted at each end thereof to the rails and fish-plates, with the necessary bolts for attaching the ends of the rails to the ends of those of the adjacent section," but the plates and bolts were not attached to the rails and were shipped separately. The lower court held as a matter of law the higher rate applied; and the judgment was affirmed by the Circuit Court of Appeals; but Judge Denison, speaking for the court, said:

We assume, for the purposes of this opinion, and without undertaking to decide whether the assumption should in some cases be limited or qualified, that if there were ambiguity as to the two tariffs, or if there were material uncertainty as to the proper trade definition of an article shipped, there would be an issue of fact, and the action of the court below would have been erroneous.

But in considering which rate was applicable, he said:

For the purposes of definition and classification a steam engine does not cease to be such because the governor is omitted, nor would shoes be anything but shoes if shipped without buttons or laces. These sections might have been provided with the bolts and plates, but one tie might have been left off, whereby the sections would not have been satisfactory for contract delivery until the missing tie had been supplied, but we think they would still be "sections of portable railway track;" and the same thought covers the deficiency which here existed.

So it may here be said that the fact that the commodity in question varies in some particulars from the product that will successfully operate a Packard car does not prevent its being properly called and shipped as "gasoline."

A similar rule has often been applied by this court in determining what rate applies on imports.

Thus, in *United States v. Isham*, 17 Wall. 496, 504, the court said:

X The words of the statute are to be taken in the sense in which they will be understood by that public in which they are to take effect. Science and skill are not required in their interpretation, except where scientific or technical terms are used.

In *Swan v. Arthur*, 103 U. S. 597, 598, it was said:

While tariff acts are generally to be construed according to the commercial under-

standing of the terms employed, language will be presumed to have the same meaning in commerce that it has in ordinary sense, unless the contrary is shown.

In *American Net and Twine Co. v. Worthington*, 141 U. S. 468, 471, the court said:

It is a cardinal rule of this court that, in fixing the classification of goods for the payment of duties, *the name or designation of the goods is to be understood in its known commercial sense, and that their denomination in the market when the law was passed will control their classification without regard to their scientific designation, the material of which they may be made, or the use to which they may be applied.*

And in *Hedden v. Richard*, 149 U. S. 346, the court said that the words used in customs tariff "*are to be taken in the sense in which they will be naturally understood by those to whom they are addressed.*"

X Under the regulations of the Interstate Commerce Commission the commodity shipped could not lawfully be transported under the designation "unrefined naphtha"

Section 235 of the Penal Code of the United States (35 Stat. L. 1134) provides that—

The Interstate Commerce Commission shall formulate regulations for the safe transportation of explosives. \* \* \*

In conformity with this statutory direction, and under the additional authority of section 15 of the act to regulate commerce, the Commission formulated and promulgated, in 1910, a set of "Regulations

for the transportation of explosives and other dangerous articles." Such regulations of an administrative body, issued under the authority of a statute, have the binding force of law. *United States v. Eaton*, 144 U. S. 677; *United States v. Grimaud*, 220 U. S. 506; *Interstate Commerce Commission v. Goodrich Transit Co.*, 224 U. S. 194.

Important amendments of these regulations were made in 1914, 1916, and 1918. Rule 1824 of the regulations relates to the transportation of inflammable liquids and paragraph (k) of that rule relates particularly to liquid condensates from natural gas or from casinghead gas of petroleum oil wells—in other words, to casinghead gasoline.

Paragraph (k) of rule 1824, effective except as noted therein May 15, 1916, in force at the beginning of the period covered by the indictment (December 2, 1916), and remaining in force without change until September 1, 1918, will be found on pages 1079–1080 of the record. On September 1, 1918, paragraph (k) of rule 1824 was amended. The amended rule is found at pages 1259–1260 of the record.

Apparently the Court of Appeals did not consider the important bearing of these regulations upon the question at issue, i. e., whether the commodity shipped was gasoline or unrefined naphtha, and therefore it apparently did not appreciate that the testimony of defendant's expert witnesses that the commodity in question was not gasoline was at variance with the views of the Commission as ex-

pressed in the regulations, that the product of the compression of natural gas or the blending of liquefied petroleum gas with refinery gasoline or naphtha is gasoline.

The attention of the court is called particularly to the "List of principal dangerous articles," as published in both sets of regulations, that is, both the regulations of May 16, 1916, and those of September 1, 1918. These lists will be found at pages 1070-1076 and 1248-1255 of the record. These lists show the names of *well-known* articles in general use, other than explosives, that are dangerous, each list being preceded by a statement to that effect (see pages 1068 and 1220 of the record), rule 1807, which reads:

#### LIST OF PRINCIPAL DANGEROUS ARTICLES

1807. (a) The following list shows the names of well-known articles in general use, other than explosives, that are dangerous; \* \* \*

Included in the lists are "gasoline" and "liquefied petroleum gas." Liquefied petroleum gas is the liquid condensate from natural gas or from casing-head gas of petroleum oil wells (casinghead gasoline), whose vapor tension exceeds 10 pounds per square inch. (Rule 1824-k.)

Opposite the word "Gasoline" as published in both lists appears the following note, the significance of which will not escape the court:

Gasoline made by compressing natural gas or by blending liquefied petroleum gas with

refinery gasoline or naphtha may be described and shipped as gasoline, provided the vapor pressure does not exceed 10 pounds per square inch.

We submit that by this expression the commission recognized that casinghead gasoline, whether unblended or blended with refinery gasoline or naphtha, is gasoline. The recognition that unblended casinghead gasoline is gasoline is embodied in the first clause, "*Gasoline made by compressing natural gas.*" The recognition that casinghead gasoline when blended with refinery gasoline or naphtha is gasoline is embodied in the words "Gasoline made \* \* \* by blending liquefied petroleum gas with refinery gasoline or naphtha."

Another feature of the lists of dangerous articles whose significance is highly important is that *unrefined naphtha* does not appear in the lists. Is it not a matter of plain, common sense that if the commodity which is the subject matter of this case were unrefined naphtha it would be shown in these lists of names of well-known articles in general use that are dangerous? The commodity in question surely must be regarded as a well-known article when it is taken into consideration that in 1915 over 65,000,000 gallons of it were produced in the United States, and between 80,000,000 and 100,000,000 gallons in Oklahoma and California alone in 1917, and 300,000,000 gallons in 1919. (See page 2, Dykema's Bulletin and Rec. 690.) Not only does *unrefined naphtha* not appear in the lists of dangerous

articles as published in the regulations, but *that term does not appear anywhere in the regulations.*

There is no authority in either set of regulations to describe or ship this commodity as "unrefined naphtha." Paragraph (k) of the regulations of May, 1916, provided in part as follows:

Liquid condensates from natural gas or from casinghead gas of petroleum oil wells whose vapor tension exceeds 10 pounds per square inch must be described as liquefied petroleum gas. \* \* \*

When the condensate, blended or unblended with other products, has a vapor tension not exceeding 10 pounds per square inch, and is shipped as "Gasoline" in an ordinary tank car, 60-pound test class, defined in Master Car Builders' Association Specifications for Tank Cars, the safety valves of such a car must be set to operate at 25 pounds per square inch, with a tolerance of one pound above or below. \* \* \* (Rec. 1079.)

The amended regulations of September 1, 1918, provided:

Liquid condensates from natural gas or from casinghead gas of oil wells, made either by the compression or absorption process, alone or blended with other petroleum products must be described as liquefied petroleum gas when the vapor pressure exceeds 10 pounds per square inch.

When the condensate, alone or blended with other petroleum products, has a vapor pressure not exceeding 10 pounds per square inch,

it must be described and shipped as gasoline, casinghead gasoline, or casinghead naphtha.

It seems clear that under the earlier regulations there were but two terms which could properly be used for railway billing purposes in the transportation of casinghead gasoline, either alone or blended with some other petroleum product, (1) "liquefied petroleum gas," when the vapor pressure exceeded 10 pounds per square inch, and, (2) "gasoline," when the vapor pressure was 10 pounds or lower. This is also true under the regulations of September 1, 1918, except that under those regulations the product could be shipped as "casinghead gasoline" or "casinghead naphtha" besides as "gasoline" when the vapor pressure was 10 pounds or lower. There was no authority whatever to ship it as unrefined naphtha; and the shipping of it under that designation alone, or in addition to some authorized designation, was a violation of the regulations and itself a misdemeanor under section 235 of the Penal Code.

It may be suggested that the regulations of the commission are safety regulations and do not have bearing upon the rates. But these regulations do have a bearing on the rates, for the reason that the regulations were published in the Western Classification and thereby made a part of the tariff rules governing the transportation. The regulations effective October 1, 1914, as amended to September 1, 1916, including the amendments effective May 15, 1916, were published in Western Classification No. 54, I. C. C. No. 12, effective September 1, 1916 (Rec. 1062), as rule

44 thereof (Rec. 1065). Western Classification No. 55, I. C. C. No. 13, effective April 1, 1918 (Rec. 1121), superseded the previous issue and brought forward the regulations as rule 44 (Rec. 1123).

The amended regulations of September 1, 1918, were published in Supplement No. 5 to Western Classification No. 55, I. C. C. No. 13, which supplement became effective August 29, 1918. (Rec. 1140-1142.)

+ The tariffs naming the rates applicable to the shipments in question were governed by Western Classifications Nos. 54 and 55. See, for example, Supplement No. 52 to I. C. C. tariff No. 1048, effective November 16, 1916, naming the 33-cent rate on gasoline in effect at the time the shipments in question began to move, December 2, 1916, which bears the notation "Governed \* \* \* by Western Classification No. 54." All of the tariffs involved carried similar notations. Thus rule 44 of the classifications, embodying the commission's safety regulations, were made part and parcel of the tariffs, deviation from which is unlawful under the act to regulate commerce and the Elkins Act.

Since the safety regulations are part of the lawfully applicable tariffs, which constitute the legal standard, and since the regulations prohibit the transportation of the commodity in question as unrefined naphtha, it follows that the tariffs themselves negated the application of the unrefined naphtha rates on the shipments in question. Had the shipments been billed under any of the designations authorized by

the regulations, and hence by the tariffs, the gasoline rate or a rate not lower than the gasoline rate would have been applied.

In view of what has heretofore been said, but brief consideration need be given to the remaining assignments.

## II

### Assignment of errors relating to admission of evidence

#### 1. The court held that:

Throughout the trial, during introduction of evidence, and in argument the prosecution insisted that the conduct of the defendant was fraudulent. One of the grounds of this insistent (insistence) was the fact that the defendant's traffic agent asked for the rate on unrefined naphtha, a commodity which had theretofore been and was then being shipped as gasoline to Port Arthur; but in the light of the ruling of the Interstate Commerce Commission in the National Refining Company case, the rate on unrefined naphtha theretofore given by one of the carriers to Baton Rouge on a commodity shown to be substantially the same as the condensate of the Gypsy Company's plants, and the testimony in this case, we think the insistence groundless and must have been highly prejudicial. (Vol. II, p. 1690.)

There is nothing in the record indicating that Government counsel made any vicious or persistent charges of fraud against defendant. There was at

times suggestions of deception, but certainly nothing more than was amply justified by the facts proven.

As heretofore shown, the Court of Appeals was entirely mistaken as to the nature of the order made by the Interstate Commerce Commission in the National Refining Company case. The commodity there under consideration was not even of as high a grade as "crude naphtha," by which is meant the "naphtha fraction" before it is distilled and separated into gasoline, benzine, and painter's naphtha. The evidence well warranted the conclusion that the defendant was guilty of deception in securing the adoption of a rate on "unrefined naphtha," and then shipping under that rate casing-head gasoline and a blend of casing-head gasoline and painter's naphtha. But if the proof did not warrant a finding of actual fraud, yet there is no precedent to support the holding that it is reversible error for counsel to make a contention which the court subsequently finds is not maintainable. If that be a correct principle, then counsel dare not take any position in the trial of a lawsuit which he is not absolutely certain will be maintained.

2. The Court of Appeals further held that it was error to admit testimony that this same commodity was shipped to Pittsburgh by the Gypsy Company as "gasoline" while it was being shipped to Port Arthur as "unrefined naphtha," because no rate on unrefined naphtha was in effect between Kiefer, Drumright, and Jenks and Pittsburgh.

Manifestly any evidence was competent which reasonably tended to prove under what name the commodity in question was generally known and handled. And the fact that it was shipped upon any lines of road between any points under the designation "gasoline" tends to prove that it was known as "gasoline." And evidence that defendant itself was so shipping it was specially pertinent to show that it knew and recognized that gasoline was a name in use for the article. There were two important elements of proof: one, to show to what extent the commodity was known as gasoline, and the other, how commonly it was known, if at all, as unrefined naphtha. The evidence which the Court of Appeals held should have been excluded was certainly material to prove the first element, and the very fact that no rate on unrefined naphtha existed between the three points mentioned and Pittsburgh, though this commodity had for years been shipped from them to Pittsburgh, tended to prove that it was not known in the trade as "unrefined naphtha."

Suppose a rate had been put in on beeswax between Kiefer and West Port Arthur, and thereupon defendant began to ship this commodity under that name; must the court take that designation as conclusive and exclude evidence as to the name under which it was shipped from Kiefer to Pittsburgh because no rate on beeswax existed between those points?

3. The court also held that it was error to admit evidence showing that the products at other casing

head compression plants in Oklahoma were called "gasoline" and shipped as such "without a showing that they were substantially similar to those of the Gypsy Company, and in the face of proof that they were not of a uniform blend with the Gypsy Company but contained, *in some instances*, as much as 75 per cent naphtha."

In fact the evidence did show that the products of those plants were substantially the same in character as the product in question shipped by the Gypsy Company. It may be that in some instances the blend shipped by other companies contained a higher percentage of painter's naphtha than the blend shipped by the Gypsy Company, and in other instances the blend was lower. *But the evidence shows beyond question that this entire class of products, to wit, casing head gasoline, and all proportions of blends of casing head gasoline and painter's naphtha, is known by those that produce them and in the trade as "gasoline," and are continually shipped as such.* That fact is certainly very material in determining whether or not the commodity in question was gasoline and should have been shipped under the gasoline rate; and any evidence that tended to show such fact was admissible.

### III

#### **Assignment of Errors Relating to Statements made in Argument by Defendant's Counsel**

1. The following occurred during argument of one of the Government's counsel:

COUNSEL. Mr. Tabor, the vice president of the company, quoted a list of works of about

150, perhaps, all told on the subject of naphtha, but when it came to the subject of how many of those deal with unrefined naphtha he was crowded back to the conclusion that there was but one man and that he had been quoted by another, and one of those men was the employee or rather came from the Mellon Institute in Pittsburgh. Now, what is this Mellon Institute? It is an institution that was founded by the Mellon family of Pittsburgh. Mr. W. L. Mellon is president of the Gulf Oil Corporation.

Mr. DIGGS. If the court please we except to that, as no evidence (is) in the record showing Mr. Mellon's connection with this company. W. L. Mellon as president, the evidence being that the sworn evidence of George S. Davis was president.

The COURT. Yes.

Mr. GANN. He was president of the Gulf Oil Corporation.

Mr. DIGGS. No evidence connecting him with this case at all.

The COURT. Yes there is not any evidence here and the jury will not consider it. (Vol. 1, pp. 905-6.)

In fact the statement here made by counsel was wholly immaterial, and there is nothing in the record to indicate that it could have had any unfavorable effect whatever. It was directed toward the testimony of Mr. Tabor, who seems to have cited as an authority an employee of the Mellon Institute in Pittsburgh. Counsel asserted that this institute

was founded by the Mellon family, being at the time under the impression that the evidence showed that Mr. Mellon was president of the Gulf Oil Corporation, but the court at the time told counsel that there was nothing in the record to show such fact, and the matter there ended. In the first place, the testimony of Mr. Tabor, in so far as it was based upon opinions of the nature mentioned, was within itself of practically no value; and the suggestion of a connection of a gentleman upon whose writings the witness based his opinion with the Mellon Institute, and that the Mellon Institute was in some remote way connected with some one who had an interest in the defendant, Gulf Refining Company, was entirely too remote to have had the least effect upon the mind of the jury. Undoubtedly counsel should have confined himself strictly to the record; but if it be adopted as a rule that judgments must be reversed because of such incidental remarks, but few judgments will be sustained by appellate courts.

2. The Court of Appeals also held that the following remarks made in argument by counsel for the Government were prejudicial:

Gentlemen of the jury, there is this in this case, if the commodity which they shipped and transported under the instructions which will be given to you by the Court in your judgment, after hearing all of the evidence, is gasoline, then by reason of there being another name for it, they violated the laws, they placed the other shippers in a position where they were not able to compete with them; they

placed in their own pockets hundreds of thousands of dollars of which they were not entitled to and which the people of the United States have got to bear the burdens and it is true that the Gulf Refining Company will have to join, thank goodness, the other people of the United States to pay these things if it had to be paid. (Vol. 1, p. 907.)

No exception was made to these remarks by counsel for the defendant. As a matter of fact what was said by counsel is literally true as would probably have occurred to the mind of any juror, but it was such an insignificant fact that no attention would be given to it whether mentioned or not.

However, the court was careful to exclude from the minds of the jury all references by counsel upon both sides to matters outside the record. When court convened on the morning after these remarks were made, as argument was about to be resumed by counsel for the Government, the court remarked:

Wait a minute. Now, gentlemen of the jury the defendant makes the following exception; the defendant excepts to the comment of the Government's counsel, Gann and Chambers, suggesting that the United States Government pecuniary affected by the manner of the consideration, the defendant not being on trial on charge of defrauding the United States, and also except to the comment of the Government counsel Chambers upon the wealth of the defendant; such comment to the jury being highly improper and calculated and inflame and defendant moves the court to

instruct the jury to especially disregard such remarks. And defendant also excepts to the statement of Mr. Chambers to the jury charging the defendant had violated the safe transportation rules, such charge being contrary to the fact and admission of the Government, and calculated to inflame; and defendant moves the court to especially instruct the jury regarding it. Now, yesterday both sides on these points, to my mind, went outside of the proper domain, as there was no objection, I permitted them to do that. One side charged in the argument that the railroad a part of the time when the railroad under the war, under the Federal control. Then the statement was made about what the result would be affecting members of the jury. Everything else, that has got nothing to do with the case. Then the other side said how it affected their clients, how they could be made to refund in civil damages. So I admonish you to try the case according to the evidence. Hear the arguments of the attorneys, and when they are sound, if they are sound, that is for you to determine about that. If they do not confine themselves to the evidence in the case, that is for you to determine about that. The case is to be tried without fear or favor. Without any regard as to how it affects people, but solely with a view to the weight of evidence as to be determined by the jury and as to the law to be given you. The exception was made on the reconvening of court and after the argument had been made the previous day, but before the argu-

ments were finally concluded. (Vol. 1, pp. 908-9.)

And just before the Trial Judge delivered his charge to the jury he again admonished them as follows:

Gentlemen of the jury, before I begin the charge I will read to you what I said this morning. Now, on yesterday both sides on these points, to my mind, traveled outside of the domain of proper argument. I permitted them to do this, no objection being made by either side at the time. One side suggested in the argument that the railroads a part of the time were under Federal control, being in the hands of the Director General; in another statement that was made, that the result of the verdict might affect the interests of the taxpayers, including the interests of the jurors, or in substance that. Then on the part of the defendant it was adverted to the fact that the defendant could be made to refund in a civil suit. The jury are admonished that the case is to be tried according to the evidence and the admissions in the case. The jury are to hear the arguments of the attorneys, and when they consider the argument sound as relating to prove facts from the evidence admitted in the case and the admissions in open court before the jury, that is for them to determine. If the attorneys do not confine themselves to the evidence and admitted facts in the case, the jury should disregard such argument. The case is to be tried without fear or favor and without prejudice and without any regard to the pecuniary effect upon any-

one, but solely with a view of justice. As regards the safety appliances, it is my understanding there is no contention of any violation of the same by the defendant in observing regulations prescribed as precautions to safety. That is for the purpose of reading that in the record and is an admonition to the jury. (Vol. 1, p. 911.)

These instructions by the court certainly obviated any unfavorable influence that argument of counsel otherwise might have had upon the minds of the jury.

For the foregoing reasons the judgment of the Circuit Court of Appeals should be reversed and the judgment of the District Court affirmed.

JAMES M. BECK,  
*Solicitor General.*

J. A. FOWLER,  
*Special Assistant to the Attorney General.*

# In the Supreme Court of the United States

OCTOBER TERM, 1924

---

THE UNITED STATES OF AMERICA,

PETITIONER

v.

GULF REFINING COMPANY

---

No. 40

*ON WRIT OF CERTIORARI TO THE UNITED STATES CIRCUIT  
COURT OF APPEALS FOR THE EIGHTH CIRCUIT*

---

**GOVERNMENT'S BRIEF IN REPLY TO "BRIEF FOR  
DEFENDANT"**

---

Presumably on the assumption that if this court should conclude there is reversible error in the holdings of the Circuit Court of Appeals, it will then consider questions raised in, but not passed upon by, that court, defendant has included in its brief a discussion of all questions there presented. That the court may have before it the Government's contentions as to all questions involved in the case, there is here reprinted with slight modification, and filed as a reply brief, those parts of the Government's brief used in the Court of Appeals as a reply to the questions of law there raised by defendant.

## PLEA IN ABATEMENT

(Defendant's brief 70-79)

A plea in abatement was filed by plaintiff in error, in which the indictment was attacked—

because the said pretended indictment was not read or by said Grand Jury, and said Grand Jury did not at any time know the contents thereof, and consequently the said Grand Jury did not vote upon the same.

To this plea the United States demurred, and the court, holding that the demurrer was to be treated as an exception to the sufficiency of the plea and as a motion to strike, after argument by counsel, struck the plea from the record.

The averments, except the concluding clause—“consequently, the said Grand Jury did not vote upon the same”—are identical with those in *United States v. Terry*, 39 Fed. 355. The clause referred to is manifestly not an averment in the true sense, is merely an argumentative inference from the preceding averments, and is negligible.

In the *Terry* decision the court ruled that a plea in abatement does not lie, but that the course which should be followed is by way of a motion to quash the indictment.

The plea in abatement, therefore, was rightly stricken.

Defendant also interposed a motion to quash, the averments in the motion being the same as in the

plea except that there was omission of the final argumentative clause.

After argument the court, in its discretion, struck the motion to quash from the record.

This exercise of the court's discretion is amply supported by the *Terry* decision above cited, which contains a full and learned discussion of the law as applied to facts substantially identical with those in the case at bar. It is also fully supported by the following cases:

*United States v. Rosenburgh*, 7 Wall. 580.

*United States v. Avery*, 13 Wall. 251.

*United States v. Hamilton*, 109 U. S. 63.

*McGregor v. United States*, 134 Fed. 187.

#### THE POINTS RAISED BY DEMURRER

(Defendant's brief 79-112)

#### FACTS ARE AVERRED IN THE INDICTMENT WITH REQUISITE LEGAL CERTAINTY

The accused is entitled to be apprised of the precise charge brought to enable him to make defense and to avail afterwards of the plea of autrefois convict. The court must be informed of the facts so that it may decide whether they will support a conviction. Hence the rule requiring statement, with reasonable particularity of time and place and circumstance, of *facts* and not mere conclusions of law. Legislative definition of statutory crime may require or permit use of generic terms, but in framing indictments in such cases it may not always

suffice to copy statutory language. In order to satisfy the rule just stated the count must at times descend into particulars. *Armour Packing Co. v. United States*, 209 U. S. 56, 83-4.<sup>1</sup>

However, there can be no objection to use of statutory terms provided, in connection with other averments, they are sufficiently descriptive of the offense. In other words, it is sufficient to charge acts falling within the statutory prohibition in the substantial words of the statute provided requisites of good pleading are met. Cf. *United States v. Simmons*, 96 U. S. 360.

The gist of the crime denounced by the Elkins Act is "receipt of a concession." In this indictment guilt is imputed and charged by use of this language accompanied with precise averments of date, place, and kind of shipment, names of carriers, destination, route, its interstate character, the published legal rate, the rate for which the shipment was actually carried, and the receipt of a "concession," *with the amount thereof stated in exact figures*, whereby transportation was averred to have been had at rates less than those published.

---

<sup>1</sup> Under a statute penalizing "devising of any scheme or artifice to defraud" the bare charge that defendant "devised a scheme to defraud" was held insufficient. Particulars must be alleged from which it may be seen that the scheme was a fraudulent one within the intendment of the statute. *United States v. Hess*, 124 U. S. 483, 486-9.

A charge in statutory words of an intent to hinder, etc., enjoyment "of all the rights, privileges, and immunities \* \* \* of citizens because persons of African descent was held bad because it failed to specify the rights intended to be interfered with. *United States v. Cruikshank*, 92 U. S. 542, 557-9.

Substantially similar indictments were sustained in *Chicago, St. P., M. & O. Ry. Co. v. United States*, 162 Fed. 835, 838, and in *Armour Packing Co. v. United States*, 153 Fed. 1, 16, 17, affirmed 209 U. S. 56.

Defendant, however, insists that this indictment is demurrable because it charges generically in the statutory language "receipt of a concession," but fails to specify whether the concession "consisted of free demurrage, collection at less than the lawful rate with or without a device, a rebate with or without device, extension of credit, etc." Further, that it fails to specify whether defendant by agreement with a carrier in the first instance paid less than the lawful rate, or whether it paid the full rate, subsequently accepting return of a portion, or whether it received something else of value in connection with the transportation instead of money.

An inspection of the counts shows the want of merit in this connection. Count 1 charges (R. 4) receipt of a concession of  $13\frac{1}{2}$  cents per hundred pounds off the rate named in published schedules in force, "*which said concession so accepted and received by the said Gulf Refining Company from the said common carriers amounted in the aggregate to \$72.55.*" \* \* \* Other counts are similar.

This is a charge that defendant got its merchandise transported for \$72.55 less money than should have been paid. And it excludes the notion that the concession consisted of anything but money or that a rebate was given.

It has been definitely decided (*Armour Packing Co. v. United States, supra*) that the use of a device is not an element of the offense and need not be averred. Moreover, the court there denied a contention that the indictment was insufficient because it omitted to set out *of what the concession consisted or how it was granted* (p. 83). When as here the indictment apprises defendant of the particular shipment complained of, of its route from starting point to destination, of the published rate as contrasted with that actually paid for the transportation, an allegation in the language of the statute of receipt of a concession without specification of the methods by which it was obtained is clear and certain to common understanding.

It is not seriously contended here that defendant was actually misled or that lack of knowledge of the real accusation hampered its defense. It was not led to believe that it was charged with accepting a technical rebate or free demurrage or with receiving some benefit other than money. The trial demonstrated that it was at all times fully aware of the conduct on which guilt was imputed.

Section 1025, R. S., reads in part:

No indictment \* \* \* shall be deemed insufficient, nor shall the trial, judgment, or other proceeding thereon be affected by reason of any defect or imperfection in matter of form only, *which shall not tend to the prejudice of the defendant.*

This provision was applied to a similar indictment by the Supreme Court in *Armour Packing Co. v. United States*, *supra* (p. 84), and it was said:

There can be no doubt that the accused was fully advised of and understood the precise facts which were alleged to be a violation of the statute.

As we interpret this law, it is intended, among other things, to prohibit and punish the receiving of a concession for the transportation of goods from the duly filed and published rate. Each and all of the elements of the offense, with allegations of time, place, kind of goods, and name of carrier, are distinctly charged in the indictment, and include the fixing of the published rate at 23 cents per 100 pounds; the changing of the rate and the new publication at 35 cents per 100 pounds; the knowledge of this change on the part of the shipper, and the carriage of the goods over a described route at a concession of the difference between the published and the contract rate—all these facts being stated, the indictment is clearly sufficient.

Cf. *Ex parte Pierce*, 155 Fed. 663, 665.

In *Chicago, St. P. M. & O. Ry. Co. v. United States*, 162 Fed. 835, 836 (212 U. S. 579), the offense was collection of full rates and the subsequent return to the shipper of an elevator charge not published in the filed tariff. In the indictment this transaction was represented by an allegation (p. 836) that the defendant paid certain

rebates and certain concessions whereby the property was transported at less compensation and rate than that named in the schedules; "that is to say, a rebate, refund, and concession of one-half cent per bushel." It was not specifically averred that the rebate represented the elevator charge. The accusation followed the statutory language charging simply that the railroad granted a "rebate" or "concession" whereby the property was transported at the less rate. It was held that this was sufficiently precise and definite.

In *Standard Oil Co. v. United States*, 179 Fed. 614, 617-9, an indictment similar to this stating details of the shipment, contrasting the rate lawfully chargeable with that paid and charging that defendant thereby knowingly accepted and received a concession was attacked because of failure to allege payment of the unlawful rate. It was held that the indictment, by following substantially the language of the statute, charged the gist of the offense—the receipt of the concession—with sufficient certainty and particularity. It will be observed that the averment in the statutory language of the acceptance of a concession was held equivalent in common understanding to an averment of its payment, a fact thought essential to guilt and not otherwise specifically pleaded.

These cases are alike in principle with *United States v. Scott*, 74 Fed. 213, 217, which points out that colloquial expressions, utilized in the description of statutory crimes, are also sufficient for use

in the indictment if sufficiently informative. Such expressions may well be regarded not as averments of conclusions of law but as adequate descriptions of *concrete fact*.

THE INDICTMENT NEED NOT AVER COMPLICITY ON THE  
PART OF THE COMMON CARRIER

Prior to December 2, 1916, all freight of this description was indiscriminately rated as gasoline. Thereafter in the applicable schedules filed the commodity was divided into two classes, "gasoline" and "unrefined naphtha," the published rate on the latter being substantially less. Defendant was convicted on proof showing that on carloads consigned to it as "unrefined naphtha" it paid at destination the prescribed rate for that commodity; whereas the product actually shipped was not unrefined naphtha but gasoline, for which it should have paid the higher rate. Consequently, defendant "knowingly" received a concession of this difference. The carrier, of course, *granted* the lower rate, but it was not averred or proven that it was aware that the shipment was gasoline and not "unrefined naphtha," and, therefore, that it purposely or "knowingly" granted a concession. Is such complicity an essential element of the offense and must it be averred in the indictment?

The history of legislation dealing with discrimination in rates and its judicial construction demonstrate that this contention is based on a narrow and inadmissible interpretation of the Elkins Act.

The purpose of Congress was to cut out by the roots every form of discrimination, favoritism, and inequality.

*Louisville & Nashville R. R. v. Mottley*,  
219 U. S. 467, 478.

It is the object of the interstate commerce law and the Elkins Act to prevent favoritism by any means or device whatsoever and to prohibit practices which run counter to the purpose of the act to place all shippers upon equal terms.

*United States v. Union Stock Yard*, 226  
U. S. 286, 309.

The Act of March 2, 1889, c. 382, 25 Stat. 857, as amended by § 10 of the Act of June 18, 1910, c. 309, 36 Stat. 539, U. S. Comp. Stat., § 8574 (3), forbids false and fraudulent billing, classification, or other representation whereby, with or without the carrier's connivance, transportation is sought at less than legalized rates. The gist of these offenses is *willful fraud*. But it became increasingly manifest to Congress that by methods falling short of willful fraud shippers could get concessions—often at the carrier's expense and without its concurrence—and that it is often difficult to persuade a jury of the existence of actual bad faith. The constant purpose in the series of acts to regulate interstate commerce being to bring about exact equality, the observance in similar circumstances of the one prescribed rate

by the shipper as well as the carrier, the applicable provision of the Elkins Act has been aptly described as a "catch-all" provision for any practice by either carrier or shipper, which by any device whatever would tend to defeat the purpose of the law.

*United States v. Vacuum Oil Co.*, 153 Fed. 598, 604.

In *Armour Packing Co. v. United States*, *supra*, it is broadly held that if by any method (whether it may or may not be described as a "device" or whether it can or can not be stigmatized as "fraudulent") the shipper obtains transportation at less than published rates, he offends against this section (209 U. S. 72):

The Elkins Act proceeded upon broad lines and was evidently intended to effectuate the purpose of Congress to require that all shippers should be treated alike, and that the only rate charged to any shipper for the same service under the same conditions should be the one established, published, and posted as required by law. It is not so much the particular form by which or the motive for which this purpose was accomplished, but the intention was to prohibit any and all means that might be resorted to to obtain or receive concessions and rebates from the fixed rates, duly posted and published.

In *United States v. Metropolitan Lumber Co.*, 254 Fed. 335, 342, defendant procured transportation in violation of an embargo laid on all private

shipments of lumber. The carrier could not and did not know, acquiesce, and connive. The district judge, upon unanswerable considerations, held that such complicity was not an essential of the offense and that the Elkins Act was passed to cover the loopholes which previous acts had left open for discrimination and the exercise of favoritism.

Defendant contends that there is still a loophole left and that Congress has not penalized acceptance of a concession except where the carrier consciously participates. Having regard to the complexity of railroad freight business and to the wide opportunity afforded (as demonstrated by this record) to obtain concessions of which the carrier is or seems to be ignorant, and considering also the difficulty of proving the carrier's actual knowledge, it is believed that this court will not hesitate to deny this ground of demurrer.<sup>1</sup>

#### WAS DEFENDANT A SHIPPER

Stripped of detail, the counts set forth specific interstate consignments of gasoline from the Gypsy Oil Co. to defendant; delivery to initial carrier; transportation by it and connecting carriers pursuant to instructions given by consignor *and by defendant*; delivery by carrier to defendant in Texas; freight charges (set forth in dollars and cents), *thereupon becoming due by defendant and*

<sup>1</sup> In *United States v. Vacuum Oil Co.*, 153 Fed. 598, 604, the court observes that the word "concession" does not necessarily signify or imply that the shipper *solicited* a concession which the carrier could give.

payable to the carrier; receipt by defendant of a concession off the legal rate of a definite sum.

Defendant urges that these allegations fail to show—

(a) that it was indebted for the transportation;

(b) that it was a “shipper” within the meaning of the Elkins Act.

(a) There can be no serious denial that a shipper may incur indebtedness for freight charges who joins in instructions under which the carrier receives, transports, and delivers cargo to such shipper as its consignee. Business is done on these terms by a sort of universal practice or consent. It would entail intolerable prolixity and delay if the government were forced to load indictments with minute details of every circumstance attending a shipment tending to show assumption of freight charges by the consignee. The indictment here states the facts from which the liability arose and charges sufficiently and directly that the consignee *became indebted*, etc. Contents of bills of lading and other documents attending the transaction were properly left for the proof. Defendant was apprised by the indictment of every fact upon which its indebtedness for the proper freight charges arose.

(b) The Act of June 29, 1906, c. 3591, § 2, 34 Stat. 587, amending the text of the Act of February 19, 1903 c. 708, § 1, 32 Stat. 847, did not evince intention to relieve consignees from the penalty im-

posed upon consignors, thus deviating from the steadfast congressional purpose to extirpate all manner of favoritism and discrimination in interstate commerce.

By the Act of 1903 it was made unlawful for *any person or corporation* to give or take any rebate, concession, etc., and every such person or corporation was declared guilty of a misdemeanor. One purpose among others of the amendments introduced by the Act of 1906 was to settle the doubt theretofore entertained whether conviction could be had without proving that the act was knowingly or willfully done. *Great Northern Ry. Co. v. United States*, 155 Fed. 945, 955 *et seq.* The text was altered to read "every person or corporation, whether carrier or shipper, who shall, knowingly, offer, grant or give, or solicit, accept, or receive any such rebates, concession, or discrimination, shall be deemed guilty of a misdemeanor \* \* \*."

The word "knowingly" was inserted and furthermore after the words "every person or corporation" the words "whether carrier or shipper" were inserted in order to make it perfectly clear that illegal purpose must be fastened on carrier as well as shipper. There is no valid evidence of intent to restrict otherwise the generality of the Elkins Act. There is no sound reason for the assumption that the word "shipper" was given a technical significance but every reason to conclude that it was intended to include consignees, since it

must have been known to Congress that a large proportion of freight traffic is actively directed by and a large proportion of freight charges paid by consignees and that the latter are as vitally interested as are consignors in procuring concessions or other favors from the carrier.

These questions were in debate in *United States v. Metropolitan Lumber Co.*, *supra*, and the logical conclusion was reached by the district judge that, since goods are in reality transported by the consignee when he pays the freight and since he is the only person in such cases benefited or interested in concessions or rebates, for obvious reasons, unless the very purpose of the act is to be nullified, such a consignee is a shipper within the meaning of the act as he is in fact. *Ib.* 346.

The words "every person or corporation, whether carrier or shipper" are too wide to permit the inference that an active consignee paying the freight is not included. *Cf. United States v. Standard Oil Co.*, 148 Fed. 719, 722.

COUNTS 36 TO 40 AND 81 TO 85 ARE NOT DOUBLE

The statute penalizes acceptance of (1) rebates, (2) concessions, or (3) discriminations. These words differ in meaning, and the practices denoted by them are susceptible of classification. The shipper may illegally get back a part of what has been paid—rebate; pay in the first instance less than the legal rate—a concession; get a preference represented by something besides money—which

may be fairly described either by the word "concession" or by the word "discrimination."<sup>1</sup>

But it seems reasonably beyond cavil that every "rebate" and every "concession," except it be accorded to all shippers alike, is also a "discrimination."

The counts here in question are like the others except for an averment that an outside company shipped gasoline during the same period by the same route, paying full legal rates. They charge receipt of concessions by defendant whereby transportation was had at less than legalized rates and *whereby a discrimination was practiced in favor of defendant and against the outside company.*

Under the statute it is unlawful to "receive any rebate, concession, or discrimination" whereby property shall be transported at less than legalized rates "or whereby any other advantage is given or discrimination is practiced," and receipt of any such rebate, concession, or discrimination is made a misdemeanor.

The counts specified what the discriminations charged were, viz, transportation at less than legalized rates. No discrimination other than this was averred. There was but a single charge included in each of these counts, namely, receipt of a concession which was at the same time a discrimination; or, conversely, receipt of a discrimina-

---

<sup>1</sup> Cf. *United States v. Metropolitan Lumber Co.*, 254 Fed. 335; *Dye v. United States*, 262 Fed. 6; *Hocking Valley Ry. Co. v. United States*, 210 Fed. 735.

tion by means of a concession from the published rates. There was no effort to charge two offenses growing out of one and the same shipment. Defendant was accused of and is to be punished for but one offense—a single act which, however, under the statute was illegal because proved to be both a concession and a discrimination. Authorities abundantly sustain the validity of the counts.

It is a commonplace of criminal practice that when a statute forbids the doing of several things not repugnant to each other, defendant may by a single act violate all the prohibitions or some one or more of them. In either case he may properly be charged in a single count with violation of all the forbidden things and convicted for one offense if the proof shows that he violated any one or all of them. Bishop's New Criminal Procedure (2d ed), § 436.

In *Crain v. United States*, 162 U. S. 625, 636, it is said:

The statute was directed against certain defined modes for accomplishing a general object, and declared that the doing of either one of several specified things, each having reference to that object, should be punished.

\* \* \* We perceive no sound reason why the doing of the prohibited thing, in each and all of the prohibited modes, may not be charged in one count, so that there may be a verdict of guilty upon proof that the accused had done any one of the things constituting a substantive crime under the statute.

The statute under consideration is violated by the mere offer or by the actual grant of a rebate. Giving a rebate includes both grant and offer. If but stages of the same transaction and committed by one person, the entire act may be properly included in one count as a single offense.

DURING FEDERAL CONTROL THE PROVISIONS OF THE  
ELKINS ACT RELATING TO OFFENSES BY SHIPPERS  
WERE IN FORCE

The act forbids rebates, concessions, etc., *in respect of interstate transportation by any common carrier subject to the act to regulate commerce*. It is argued that during federal control it became inoperative because the government was not a *common carrier subject to the act to regulate commerce*.

If this reasoning be sound, it would follow that every offense against person or property denounced by federal or state law was likewise immune from punishment provided the applicable statute, in defining the offense, employed words similarly linking the forbidden act with the property or the instrumentalities of the *common carriers* taken over by the government. The mind

recoils from this consequence, and it is, of course, obvious that it was not so intended either by the Executive or by the Congress.

Temporary control of the railroads was taken for war purposes. As is well known, they continued as before to serve the public as common carriers *in fact*; the government simply stepped into the place of the corporate owners, continuing through the old organization to furnish transportation to all alike and *to act as common carrier in fact if not in law*. All freight and passenger traffic offered was transported as usual except as delayed by war needs.

It is only because of certain peculiar rights and obligations attaching to the status that the "common carrier" is distinguished from other business agents. If these rules of law are applied (and there is no natural reason why they should not be) to transportation facilities operated by the government, then the government becomes in law, as it is in fact, a common carrier. Moreover, there is in the nature of things no reason why government should not furnish transportation to private shippers (so far as compatible with paramount duties imposed on the sovereign by the war) without discrimination in accordance with existing acts regulating commerce; nor why the penal sections of these laws should not continue their wholesome restraint upon self-seeking shippers and railroad officials.<sup>1</sup>

---

<sup>1</sup> Subjection of a government-owned ship to the legal incidents attending operation of an ordinary private merchant vessel is illustrated by *The Lake Monroe*, 250 U. S. 246, 254, et seq.

It is believed that this result was intended and established as law, as shown by the following citations:

Act of August 29, 1916, c. 418, 39 Stat. 619, 645; U. S. Comp. Stat., § 1974(a), authorizing control of transportation.

The President's proclamation of December 26, 1917, 40 Stat. 1733.

Secs. 1, 8, 9, 10, and 15 of the Act of March 21, 1918, c. 25, 40 Stat. 451; U. S. Comp. Stat. 1919, Supp., §§ 3115½ a, h, i, j, o.

To escape the plain significance of these provisions defendant urges:

(a) That the common carrier status may not logically be attributed to transportation systems under federal control because the government was not bound to serve all alike, but had power to lay embargoes or otherwise discriminate in favor of military traffic.

It suffices to reply that in time of war it was already the statutory duty of common carriers to accord preference and precedence to military traffic.

*Interstate Commerce Law*, § 6, as amended by the Act of August 29, 1916, c. 417, 39 Stat. 604; U. S. Comp. Stat., § 8569(8).

No one would contend that in the absence of federal control, or before it began, obedience to this statute took from the railroads their status as common carriers in respect of private traffic and thus suspended all laws controlling it. Nor were the provisions of § 10 of the Federal Control Act

imposing common carrier responsibility on "carriers while under federal control" nullified because of the powers granted to meet the military emergency.

(b) Something is made also of that part of the Elkins Act which imputes to the incorporated common carrier certain guilty conduct of its agents and of the absurdity of imputing guilt to the government when it stepped into the carrier's place.

Paradox like this is always attractive to juvenile curiosity and when aided by the wit and ingenuity of the scholiast can be carried far. But in serious business it has little place. Counsel find no difficulty in admitting that, since the government may not punish itself, this part of the law was suspended during federal control.

But is there anything in the cited texts or elsewhere from which to deduce the intention to obliterate the penalties imposed by the act on individuals and private shippers? Is it not on the contrary clear that both executive action and applicable federal legislation in respect of federal control not only did not suspend but kept in force the common carrier status and the regulatory acts of Congress as regards ordinary traffic?

By the act of 1916 military possession and control was authorized to the exclusion of other traffic *but only as far as might be necessary*. The President by virtue of this authority undertook on behalf of the government the duty of performing (as far as possible) the usual and ordinary business

and duties of common carriers, explicitly announcing, moreover, his intention to operate and control these systems of transportation subject to existing statutes and orders of the Interstate Commerce Commission, etc., except as otherwise determined and declared by specific orders. This declaration and act of the President was recognized and given the force of law by the Federal Control Act of 1918, reciting the President's action; providing methods for compensating the carriers; authorizing the President to execute any of the powers therein or theretofore granted him with relation to federal control through such agencies as he might determine (§ 8); continuing the provisions of the Act of August 29, 1916, *supra*, and conferring on the President the further and other powers necessary and appropriate to give effect to the powers then and theretofore conferred (§ 9). Finally (§ 10) carriers while under federal control were made subject to all laws and liabilities *as common carriers*, whether arising under state or federal laws or at common law, except so far as inconsistent with legislation or orders of the President. Keeping in mind that the word "carriers" here employed means "railroads and systems of transportation," and that the words "federal control" mean the action of the President taking over possession, use, control, and operation (see § 1), how can it be said that these railroads while operated under this connected and linked series of statutes and executive orders were not by force of the actual text of the

Federal Control Act common carriers of persons and property subject (in accord with the President's declaration as ratified by that act) to applicable existing statutes and orders of the Interstate Commerce Commission?

In *Missouri Pac. R. Co. v. Ault*, decided June 21, 1921, 41 Sup. Ct. 593, it was held that since federal control displaced corporate management the carrier corporation could not be held liable for a penalty imposed by Arkansas law. Moreover, that § 10 of the Federal Control Act should not be construed as imposing liability on the government for a penalty. The points actually decided are not important here, but in the course of the opinion several points relevant here are cleared up. It is pointed out that the authority exercised by the President was confirmed by the Federal Control Act; that the phrase "carriers while under Federal control" must be interpreted as provided by § 1 and as pointed out in this brief; that by § 10 and § 15 the United States submitted itself to the various laws, state and federal, which prescribe how the duty of a *common carrier* by railroad should be performed and what should be the remedy for failure to perform; that the plain purpose of § 10 was to preserve to the general public the rights and remedies against common carriers which it enjoyed at the time the railroads were taken over by the President except in so far as such rights or remedies might interfere with the needs of federal operation.

The trend of these remarks and their bearing on the case at bar are manifest.

In *United States v. Metropolitan Lumber Co.*, 254 Fed. 335, 349, the present contention was raised and overruled in an able opinion by District Judge Haight.

In a series of cases decided during federal control the Interstate Commerce Commission exercising powers conferred by the acts to regulate commerce administered various important sections of these acts, holding that they remained in full force and effect except in so far as inconsistent with the federal control act and with the orders of the President.

*Johnston v. A. T. & S. F. Ry. Co.*, 51 I. C. C. 356, 361.

*Inland Steel Co. v. Director General*, 57 I. C. C. 339, 342.

*Waste Merchants Assoc. v. Director General*, 57 I. C. C. 686.

*Frost & Co. v. Director General*, 57 I. C. C. 755.

*Indian Refining Co. v. Director General*, 59 I. C. C. 246, 248.

*Dupont De Nemours & Co. v. Director General*, 60 I. C. C. 621.

It may also be observed that Congress recognized the continued application to federal control of the inhibitions of the Interstate Commerce Act relating to unjust, unreasonable, and discriminatory rates and classifications, regulations, etc.

*Transportation Act, February 28, 1920*, 41 Stat. 456, 462, § 206(c).

In further support of this proposition the court will observe that existing law regulating tariffs was specifically *modified* (§ 10) so as to permit the President to *initiate rates, etc., not as usual to be subject to suspension* by the Interstate Commerce Commission, but leaving to that body the power to weigh the reasonableness of such rates and to make findings enforceable as provided in the acts to regulate commerce. Cf. *Director General v. Viscose Co.*, 41 Sup. Ct. 151.

What did this limited though important modification of existing law as to railroad rates signify? Is it not a legislative declaration that (except as specifically modified) this system of law in all other respects remained in force and continued to govern the operation of the government as a carrier of person and property?

Existing law and the common carrier status were not affected by federal control except such features as were inconsistent therewith. It is waste of space to argue at length that the penal statute here considered is entirely consistent with federal control. Prevention of discrimination secured by unfair concessions such as are in issue here was as important during the war period as before and as now.

The offense as defined by the statute and as charged in these counts was receipt of a concession whereby the property was transported at less rate than that named in the published and filed tariffs.

The point is made that the indictment fails to aver that tariffs were filed and published by the government.

Each of the challenged counts (cf. count 36, R. 54) avers that the President assumed control and operated the railroads of the three carriers over whose lines the freight was transported \* \* \* *which control, operation and utilization is herein termed federal control*; that from January 1, 1918, to June 1, 1918, *said three common carriers under federal control* had printed and filed with the Interstate Commerce Commission and had published schedules and tariffs of rates and charges \* \* \* which showed that the lawfully established rate for the transportation of gasoline \* \* \* was thirty-three cents for each hundred pounds. \* \* \*

Considering that the italicised words, *supra*, were authoritatively defined by § 1 of the Federal Control Act as construed in the *Ault case, supra*, it becomes at once manifest that the criticism is not applicable to the averments in this indictment, since they charge directly that the filed and published tariffs on which the concession was obtained were established as such under the applicable law by the direct action of the government operating the three transportation systems under federal control.

**ALLEGED ERRORS OCCURRING ON THE TRIAL**  
**THE DIRECTION OF A VERDICT OF ACQUITTAL**

(Defendant's brief 112-122)

The contention of plaintiff in error that the court should have directed a verdict of acquittal is fully discussed in the Government's original brief.

THE NATURE OF THE CONTROVERSY DOES NOT BRING  
 THE CASE WITHIN TEXAS & PACIFIC RY. CO. V. AMERICAN  
 TIE & TIMBER CO., 234 U. S. 138

(Defendant's brief 122-129)

In that case an administrative question was involved—whether any rate was in existence covering railway ties. Here no such question arose. It is undisputed that the tariffs included the commodity shipped. The question therefore is not whether an article is omitted from the tariffs, but whether it is one or the other of two commodities concededly designated therein.

*Merchants' Elevator Co. v. Gt. Northern Ry. Co.* (Minn.), 180 N. W. 105.

THERE WAS NO ERROR IN ADMITTING TESTIMONY THAT PRIOR TO DECEMBER 2, 1916, THE ARTICLE IN QUESTION WAS SHIPPED BY THE GYPSY OIL COMPANY TO PORT ARTHUR AND ELSEWHERE AS GASOLINE, AND THAT SUBSEQUENT TO THAT DATE IT WAS SHIPPED TO THE DEFENDANT AT PENNSYLVANIA AS GASOLINE; NOR IN ADMITTING TESTIMONY THAT OTHER CASING-HEAD PRODUCERS SHIPPED THE SAME ARTICLE AS GASOLINE AND THAT IT WAS EVERYWHERE REGARDED AS SUCH

(Defendant's brief 129-157)

The general principles of relevancy governing such testimony are well established.

*Chicago Great Western Ry. Co. v. McDonough*, 161 Fed. 657 (8 CCA).

*Grand Trunk R. R. Co. v. Richardson*, 91 U. S. 454.

*District of Columbia v. Armes*, 107 U. S. 519.

1 *Wigmore on Evidence*, § 461.

1 *Jones on Evidence*, § 141-a.

The defendant contends that before such proof is admissible there must be a showing that condi-

tions are substantially the same—a proposition we do not dispute. To establish similarity it is contended that the proof must show that the shipper had the choice of two rates, one on unrefined naphtha and the other on gasoline. The argument is that though this article was not gasoline, it nevertheless had to be shipped as such, gasoline being the nearest approach. Singularly enough this overlooks the fact that it is a crime for an interstate carrier to transport an article not embraced in the tariffs.

*Southern Ry. Co. v. Reid*, 222 U. S. 424.

*Texas & Pacific Ry. Co. v. American Tie & Timber Co.*, 234 U. S. 138.

If therefore this article was not gasoline both the Gypsy and this defendant were guilty of inducing the carriers to commit a crime in transporting it without an appropriate tariff. The defendant therefore stultifies itself if it resorts to such an argument.

Proof of the acts and declarations of the employees of the Gypsy Oil Company in shipping and calling this product gasoline is admissible because the evidence indicates that the Gypsy was under the complete domination and control of the defendant's officers, as much so as the defendants in *United States v. Reading Co.*, 253 U. S. 26, and *United States v. Lehigh Valley R. R. Co.*, 254 U. S. 255. In short, the relation of principal and agent existed. Donovan, now dead, was general superintendent in Oklahoma of both the *defendant and the Gypsy* (246).

But the evidence was admissible on a broader ground—on the same ground that the acts of other casing-head producers were admissible. To establish that the article was in fact gasoline, it was proper to prove, as was done, that not only the defendant and the Gypsy but all other casing-head producers regarded it as gasoline and shipped it as such, and that everyone around the plants, as well as the public, called it gasoline.

But defendant further contends that similarity was lacking because the evidence did not establish that the naphtha blend used by other producers corresponded to the Gypsy's proportion. The record makes it clear that a substantial similarity existed. Page references to the testimony are given in our outline of the case, and need not be repeated here. There was testimony showing the proportion of the blend at certain designated plants. And League, who was familiar with practically all the casing-head plants in Oklahoma as well as elsewhere, said that the proportion ran all the way from 25 to 95 per cent (447), although only cars containing a substantial amount of casing head—at least 40 per cent—were shipped (454). The defendant admitted that both before and after December 2, 1916, the article was shipped by producers as gasoline (426-7). See *Hedden v. Richard*, 149 U. S. 346.

Defendant contends that a custom or usage to be binding must be certain, uniform, general, known, not contrary to law, and not contradictory.

But defendant misapprehends the scope of the authorities cited to establish this. They pertain to cases where one party seeks to incorporate into a contract a custom or usage which he claims measures the obligation of his adversary. Manifestly before a custom or usage can be written into a contract the elements just mentioned must be shown. But that is not this case. Evidence was admitted to show that the article was in fact gasoline—that it was so regarded by shippers and the public alike. It was admissible under the same principles of relevancy as the evidence introduced in cases like *Chicago Great Western Ry. Co. v. McDonough*, *supra*, decided by this court.

Burrell, the defendant's leading expert, testified that when blended 30% naphtha and 70% casing head, and in the case of weathering, merely weathered down to the vapor tension rules provided by the I. C. C., it is not gasoline, but it is very popularly called gasoline (693-4).

#### DISCRIMINATION AGAINST THE TEXAS COMPANY

(Defendant's brief 158-161)

The statement that the material shipped by the Totem to the Texas Company was not shown to be of the same degree of blend as the Gypsy product is unwarranted. Its gravity was 71 or 72 (333). The gravity of the Kiefer product ran from 70 to 85 (640, 685, and Exhibits 66, p. 1271; 77, p. 1295; 78, p. 1301; and 80, p. 1308); the Drumright product, 76 or 77 (243, 596); the Jenks product,

77 or 78 (594). The casing-head gasoline produced at the various Oklahoma compression plants is a similar product produced by similar means (209-12, 329, 340, 395-398, 416-9, 421, 427-8, 457-461, 462-3). The evidence is undisputed that the naphtha blend reduces the gravity. The similarity, therefore, of the gravity of the Totem product with that of the Gypsy's shows that the article was substantially the same. Anderson, who did not know the exact proportions, said that the proportion is regulated according to the gravity of the gasoline (329). In addition to all this the defendant admitted that some, if not all, of the shipments contained about  $1/3$  naphtha (382).

Inasmuch as the defendant concedes that the evidence complained of was admissible if the *legal* rate was in fact what the government alleges it to be, further argument is unnecessary.

But the defendant contends that error was committed because the court excluded defendant's exhibit 142 (1463-78), a copy of a complaint filed in Texas by the Texas Company against the Director General to recover back improper freight charges; the first count alleging a discrimination against the Texas Company, and the second that the gasoline rate was improperly assessed. The bills of lading described the article as gasoline (Exhibits 22-5, 972-8), and the evidence was undisputed that the carriers collected from the Texas Company the gasoline rates. If therefore the unrefined naphtha shipped to the Gulf Company was in fact gasoline,

it is manifest that a discrimination against the Texas Company resulted when the Gulf Company paid not the gasoline but the unrefined naphtha rate. The self-serving and hearsay declarations of the Texas Company in its suit against the Director General do not alter the situation, nor tend in any way to prove the absence of discrimination. The evidence was inadmissible for any purpose.

#### OPERATION OF AUTOMOBILES ON CASING-HEAD GASOLINE

(Defendant's brief 162-164)

Defendant contends that "Evidence that certain witnesses had operated automobiles with insufficiently identified materials, admitted as tending to show that proper name of material shipped to defendant was gasoline, was incompetent and prejudicial." One of the defendant's experts had testified that casing-head gas itself will not run a car (695); another, that he had tested at the Mellon Institute the material commonly called casing-head gasoline and that the engine would not run at all (759). Furthermore, the defendant's experts in defining gasoline said that it must be a product that will satisfactorily run a motor engine (691, 743). They also said, on numerous occasions, that casing-head gasoline could not properly be termed gasoline.

The evidence complained of was therefore competent to meet this situation. As pointed out elsewhere, the proof indisputably established that all the Oklahoma compression plants produced substantially the same product by similar means.

THE EVIDENCE INTRODUCED BY THE GOVERNMENT RESPECTING THE OPERATION OF THE PACKARD CAR WITH CASING-HEAD GASOLINE, THAT WAS LATER STRUCKEN

(Defendant's brief 164-5)

The Government in rebuttal placed Dykema on the stand. He testified in substance that he hired a Packard car and drove to Brady, Swanson & Colley's plant at Jenks, where, after first thoroughly draining the tank, casing-head gasoline of 85 gravity and  $17\frac{1}{2}$  pounds vapor tension was purchased and put into the tank. With this material no trouble in running the car was experienced, a speed of 35 miles an hour being attained on the way back (826-30). Moss, from whom the material was purchased, testified that it was raw casing-head gasoline of 85 gravity; that he saw the tank drained; that it was then filled with this new material; and that the car drove away (808-9). On surrebuttal the defendant produced O'Donnell, the driver, who said that in draining the car he opened but one drain, but on returning to Tulsa he discovered that a reserve tank, the existence of which he was at the time unaware of, must be drained, too (893). The court's own examination of the witness indicates that it looked with marked suspicion upon his testimony, evidently doubting whether the truth was being told (893-4). But in the end the court, after remarking that he did not like the witness's attitude, struck out the testimony with respect to the test and admonished the jury to disregard it.

This plain and simple recital shows how devoid of merit is the contention that error was committed. The testimony was merely corroborative of that mentioned under the preceding heading.

#### MUTILATION OF RECORDS

(Defendant's brief 166-175)

The argument advanced by defendant is apparently made, not to show error in the trial court's rulings, but to explain as best it can the damaging testimony introduced below. The following explanation of why the records were mutilated is certainly not impressive.

"The most natural, reasonable, and plausible explanation as to how these erasures and deletions occurred is apparent from the evidence. The boys handling these records had been given certain instructions, which they failed to carry out at once. Upon finding the matter becoming the subject of inquiry, it was the most natural thing conceivable that they would endeavor to conceal their failure to carry out instructions by making these erasures." (Brief 169.)

These mutilated records disclose that for a long while after December 2, 1916, when the shipments were first moved under the unrefined naphtha rate, the inspectors, whose duty it was to make tests and record the results, habitually designated the Kiefer product as "Kiefer gasoline." (The mutilation consisted in erasing gasoline, a magnifying glass

being needed to discern it.) These inspectors are referred to by defendant as "boys," but their ages, if that is at all material, ran from 18 to 27 (295).

The defendant's statement that the test sheets were nothing but lead pencil blotters is unwarranted (493-501, 578), although it is really immaterial whether they were or not. In this connection it may not be amiss to say that Timmons denied that he gave instructions to the inspectors how the material should be designated (291), but others testified that Timmons would indicate what kind of oil it was (494, 496). At any rate, Timmons testified that the laboratory testers used the name commonly employed around the plant (319-320). Although he also said that this unrefined naphtha was called everything around the plant—Kiefer gas; Chain Lightning; Over the Top; Hold it in her; Gilbert; TNT—(321), it was nevertheless designated as Kiefer gasoline on these mutilated records.

The defendant's contention that all this testimony has no bearing in proving guilt, because there was no proof that the mutilation was made by authorized employes for whose conduct defendant is answerable, needs no refutation. Indeed the defendant can not argue error in the face of its admission on the trial:

And now for the first time we have information that leads us to believe that these erasures were made by an employe of the

Gulf Refining Company subsequent to the beginning of the investigation by the government and we now make this statement so the court can be thoroughly informed of the actual conditions and also make it to be used *as an admission in this case* in so far as it may be pertinent subject to inquiry (511-512).

(Whether the whole or only a part of this admission was subsequently stricken, 512, is problematical.)

Another mutilation consisted in tearing off from the Port Arthur records the headings of monthly statements reading "Receipts of Kiefer gasoline," the mutilation not being discovered until agents of the Interstate Commerce Commission inspected similar copies at the Pittsburgh office.

#### RATES

(Defendant's brief 175-183)

The defendant is frank enough to admit that its contention is technical. One of the arguments advanced is that the product in question can not be shipped under the tariffs as gasoline, it not being a petroleum product. "It is not known"—so the argument runs—"whether casing-head gas comes from petroleum at all or not" (176-7). We pass this by as undeserving of reply.

The next argument—also concededly technical—is that no rates were legally in effect during federal control, the contention being that the President's proclamation taking over the railroads (40 Stat.

1733) and the Director General's Order No. 1 of December 29, 1917 (1461-2), directing existing rate schedules to be observed, did not have that effect. We likewise pass this by as meriting no reply.

One statement, however, must not go unchallenged. We refer to the assertion, repeated in different forms throughout the brief, "that the rates on unrefined naphtha were established by the carriers at defendant's request for the express purpose of transporting the traffic involved." It is true that the unrefined naphtha rate was established at defendant's request. There is nothing, however, in the record indicating that the carriers in publishing the rate ever said they did so to enable the defendant to transport *gasoline* as unrefined naphtha. Powers, of the St. Louis and San Francisco, said that Ellis proposed a rate, saying he was going to ship naphtha. "He explained it was a *low grade* article to be shipped to Port Arthur and to be there finished and reshipped" (565). Later he said: "We were requested to put in a rate on crude naphtha or unrefined naphtha or unfinished naphtha, I don't recall which. We put it in on the regular basis." Hereupon the court asked the witness if this was done without investigating what the commodity was. The witness replied: "That is impossible. We can't go out into the field. We don't know what is being shipped. We are hundreds of miles removed from the shipping point" (571). Again, "You ask if my knowledge and conception of the term unrefined naphtha extend to knowing

whether or not there was embraced within that term naphtha produced either by casing-head compression plants or by a topping plant. I don't think we could or would take into consideration the different methods of production. That made no difference to us. It was merely a question whether the product was unrefined naphtha" (572). Again, that if a shipper asked for a rate on brick it would not be assumed he was shipping stone. And if a refiner asked us to make a rate it is assumed he will ship what he is asking for (575). This is sufficient to dispose of the defendant's statement that the rate was published for the express purpose of transporting the traffic involved.

#### THE REJECTION OF EVIDENCE OFFERED BY DEFENDANT

(Defendant's brief 183-192)

LXII. On cross-examination League was asked to state what the controversy was between him and another inspector over the mode of describing the Gypsy's product; also whether he ever had any instructions from the head of the Bureau of Explosives as to how the commodity should be billed. In holding these questions improper the court expressly told the defendant that it might prove what advices, if any, the inspectors had given the Gypsy as to the proper manner of billing—an offer which the defendant failed to embrace (438). It is plain that what the defendant sought to elicit was hearsay testimony. From any point of view the questions were not proper cross-examination.

LXIII. League was asked on cross-examination whether at a meeting of casing-head producers in 1918 to discuss rules proposed by the Bureau of Explosives to the Interstate Commerce Commission objection was made that there was divergence in nomenclature of this particular article between the tariffs and the safety transportation rules. The court properly ruled that the question was objectionable as collateral and hearsay.

LXIV. We dispose of this with the statement that no exceptions were taken. But independently of that there is no merit in the argument advanced.

LXV. An examination of Powers' testimony leading up to the rulings complained of will disclose how devoid of merit is the contention that error was committed in refusing to permit the witness to answer the two questions put to him. (See his testimony set forth under the preceding heading.) The court rightly ruled that the tariff would speak for itself.

LXVI. The Texas statute did not become a law until March 24, 1919. The indictment period does not run beyond March 12, 1919. But independently of this it was inadmissible. It was offered, to use the defendant's language, "upon the theory of negating the implications sought to be raised by the government's testimony that the material shipped was customarily called gasoline." (Brief 190.) The very fact that specifications are prescribed admits that there are gasolines of other specifications.

LXXI. The rejection of the Oklahoma statute was entirely proper. It provides that gasoline exceeding 74 gravity is deemed unsafe and its sale for *vapor stoves or other domestic uses* prohibited. It clearly recognizes that a liquid may be gasoline, even though in excess of the gravity prescribed. It had no tendency to prove that the material in question was not gasoline. (Defendant's statement that the material shipped ran from 74 to 84 degrees is incorrect. Some of it was lower than 74.)

LXXIII. DeBarr was asked on cross-examination: "Do you know what is the fact, what the Corporation Commission of Oklahoma has done with respect to ruling as to whether or not taxes should be paid on this material as gasoline, whether inspected and taxed for gasoline?" An objection was sustained (884-5). The error complained of falls within *Packet Co. v. Clough*, 20 Wall. 528, 542; *Railroad Co. v. Smith*, 21 Wall. 255, 261; *Thompson v. Bank*, 111 U. S. 529, 535; *Shauer v. Alterton*, 151 U. S. 607, 617.

But independently of this the question was irrelevant. The action of the Oklahoma Corporation Commission in taxing or failing to tax such material as gasoline can not be considered in determining the meaning of the tariff.

#### OTHER ERRORS RELIED ON IN THE EXCLUSION OF EVIDENCE

(Defendant's brief 193-201)

LXI and LXX. The defendant contends that under *Lehigh Coal & Nav. Co. v. United States*,

250 U. S. 556, it should have been permitted as bearing on the question of intent, to introduce certified copies of the pleadings and of a temporary injunction in a suit instituted by it to enjoin the Director General from assessing gasoline rates. The indictment period, it will be recalled, ends March 17, 1919. The defendant's injunction suit was brought July 21, 1919. It is true, as defendant states, that this suit was filed before the indictment, but the record discloses that Stewart, whose business it was as an agent of the Interstate Commerce Commission to recommend after investigation prosecutions of shippers and railroads for violations of the Interstate Commerce act (506), was conducting an investigation at Port Arthur as early as May 2, 1919 (606), and at Pittsburgh as early as May 20, 1919 (543-4; Ex. 95, 1375). Clearly the bringing of this injunction suit *after* the indictment period had no tendency to disprove intent *during* that period. (The lower court, it will be remembered, expressly told the defendant that it might introduce proper testimony to negative intent, 438.)

LXVII. The objection is too refined to argue. Besides it is disposed of by the cases cited under LXXIII.

LXVIII. The question complained of was improper. Bacon & Hamor's definition of unrefined naphtha was in evidence. Whether it comprehended the casing-head product was a matter the jury could easily determine. Besides, in answer-

ing the very next question the witness answered the one now complained of.

LXXII. It is urged that error was committed because the court, in the course of an unrestricted cross-examination, sustained an objection to this question: "Are you able to state what are the finished commercial products of an ordinary petroleum refinery?" This in no way was material to the testimony given on direct. Besides, the long cross-examination that followed covered the very matter which defendant now says it sought to elicit.

#### IMPROPER CONDUCT ON THE PART OF GOVERNMENT COUNSEL AND THE COURT

(Defendant's brief 201-6)

LXXV. An examination of the record will disclose that the government sought to introduce certain Indian leases in favor of the Gypsy, a subpoena to produce them having been served (261, 167-8). The purpose was to show that the Gypsy in paying the lessors their royalties had done so on the basis that the product taken out of the wells was gasoline. A long argument over their introduction ensued (269-272). The court asked Payne what authorities he had to support his contention. The latter proceeded to read a passage from Cyc dealing with admissions of conspirators, when the defendant took the exception now relied on. Its frivolousness impelled the court to say: "Oh, they have a right to do that. We haven't time to take that up. You may have an exception." (274).

LXXVI. This is so wanting in merit that we content ourselves with a mere reference to the page (308) where the proceeding complained of occurred.

LXXIX. How devoid of merit is this assignment is shown by the very form of the exception taken: "I desire to except to the statement of counsel for the government, in the presence of the jury, being argumentative, concerning the construction——" (570).

XXX. It is indeed strange that this assignment should be urged. The witness had identified the exhibit as an original record of defendant's, in his own handwriting (466). After he had read the items now complained of, the exhibit was admitted with defendant's consent (472).

LXXVII and LXXVIII. Our only comment is to invite attention to pp. 360 and 363-4.

CXVIII. An exception was taken to Payne's argument to the jury that the defendant (through Ellis, its traffic manager), having failed to get a reduction by legitimate means of the gasoline rate in effect prior to December 2, 1916, resorted to illegitimate means to attain that end. The evidence amply warranted this statement. Indeed the jury's verdict confirms this. Besides, the defendant admits in its brief (269) that it had long sought rate reductions, "asking for them, however, *under the name 'gasoline.'*"

Complaint is made that Gann in arguing to the jury asserted that one of defendant's witnesses

came from the Mellon Institute, which was founded by the Mellon family of Pittsburgh, and that W. L. Mellon was defendant's president. There was evidence that the Institute was founded by a Mr. Mellon (766), but there was no proof that W. L. Mellon was defendant's president; on the contrary, that Davidson was (766). Gann's remark was, therefore, unsupported by the testimony. But if the record counts for anything, his conduct throughout the trial was clean and exemplary, and it is quite evident that the remark was innocently made, with no intention deliberately to misstate a fact. The court told the jury to disregard it (906).

It is next urged that Gann and Chambers made improper remarks, the former in saying that by reason of federal control the government had suffered financially as a result of the transaction in question, the burden being upon the public to bear; the latter in commenting on defendant's wealth, in saying it had deprived the government of thousands of dollars and that it had violated the safety transportation rules. What they really did say will be found at pp. 906-08. The exceptions—not taken until the following day—are of narrow scope (908). The court, after remarking that both sides went outside the proper domain, *without any objection being made*, cautioned the jury to disregard the remarks now complained of (908).

It is next urged that Chambers improperly referred to the proceedings before the grand jury. In this connection it should be borne in mind that the defendant expressly admitted on the trial that

the records had been mutilated before their production on that occasion (507). They were brought under subpœna either by Tryon, general manager, or Abel, assistant superintendent (506).

But the whole matter was again brought to the jury's attention just before the charge began. The court a second time admonished them to disregard the matters now complained of (911).

#### A VERDICT OF ACQUITTAL

(Defendant's brief 206-209)

We shall of course not pause to answer the contention that the court should have directed a verdict. The defendant deplorably misconceives the evidence when it says (290) that there was a complete failure to prove that defendant knew of the existence of the gasoline rates.

#### DEFENDANT'S REQUESTS FOR INSTRUCTIONS WERE PROPERLY REFUSED

(Defendant's brief 210-217)

It is urged that requests 2, 3, 4, 8, 9, 11, 12, 13, 15, and 16 should have been given because of the distinction they draw between gasoline and unrefined naphtha. It is argued that the jury should have been instructed that the defendant could not be convicted if the material shipped could be properly designated under either term. The charge given disposes of this. The jury could not have been misled in this respect. See in particular pp. 917, 923, 924, 925.

It is next urged that requests 5, 6, 14, and 18 should have been given, the theory apparently be-

ing that the jury should have been told that the defendant was not charged with misbilling, but with accepting concessions. Number 14 is the only one bearing on this matter, the other covering different subjects. The court's instructions, however, make it plain that the defendant was not charged with misbilling.

Number 7 was properly refused. The first part is bad. Furthermore, it is not true that the evidence complained of was "admitted solely for the purpose of establishing the intent." It was admitted for the purpose of establishing the proper name of the commodity shipped.

Number 17—"If you are in doubt whether casing-head gasoline is a product of petroleum oil, you must find defendant not guilty"—was properly refused. We do not pause to answer the argument advanced.

It is urged that number 19, designed to instruct the jury that it must be convinced beyond a reasonable doubt upon each element of the offense, should have been given. But the matter was fully covered in the court's charge.

Numbers 20 and 22 were likewise fully covered in the charge.

Numbers 23, 24, 25, 26, and 31, related to questions of intent, two of them dealing with the mutilation of the defendant's records. All these, too, were embraced in the charge.

There was no error in denying numbers 27, 28, 32, 34, and 35. They were in substance improper requests to charge on the *facts*.

Number 30 was likewise properly refused. Under the court's charge the jury could not have been left in doubt as to the matter it embraces. Furthermore, the court on the trial instructed the jury as to the scope of the evidence pertaining to the shipments made to the Texas Company (332).

Numbers 33 and 36 were likewise properly refused. The jury was fully instructed concerning the shipping regulations of the Interstate Commerce Commission. One of these requests embraces irrelevant matter, and the other is a request to charge on the *facts*.

Inasmuch as the additional requests came too late—when the jury was ready to return its verdict—there is no need of discussing them. No exceptions were taken, and it is unnecessary to point out how objectionable they are from the standpoint of law.

#### CONCLUSION

From beginning to end—from the plea in abatement to the concluding arguments—the record presents one long series of objections and exceptions. No one can read it without being convinced that this procedure was deliberately chosen as the best possible means of defense.

We offer no criticism; but we insist the defendant's rights were scrupulously upheld.

OCTOBER TERM, 1924

---

UNITED STATES OF AMERICA

*v.*

GULF REFINING COMPANY

---

*ON WRIT OF CERTIORARI TO THE UNITED STATES COURT  
OF APPEALS FOR THE EIGHTH CIRCUIT*

---

**REPLY TO DEFENDANT'S MOTION TO DISMISS OR  
AFFIRM, ASSIGNMENT OF ERRORS, AND BRIEF  
AND ARGUMENT IN BEHALF OF THE UNITED  
STATES**

---

## **REASONS FOR FILING BRIEF AS AMICUS CURIAE**

This brief is filed by the Director General of Railroads in support of the writ, because, as stated in the petition, therefore, the judgment of the Circuit Court of Appeals—

Practically precludes the Government, through the Director General of Railroads, from collecting undercharges outstanding against the respondent in this respect, aggregating approximately \$500,000.

and—

Probably subjects the Government, through the Director General of Railroads, as Agent of the President, to liabilities for overcharges in this respect, aggregating \$500,000.

Furthermore, this brief will be more particularly concerned with those questions of the force and effect of the administrative regulations of the Interstate Commerce Commission, and of the carriers' tariff provisions, arising out of, or incident to the first and second reasons assigned for the granting of the petition for certiorari in that petition, which are—

(1) That the judgment of the Circuit Court of Appeals practically nullifies the powers of the Government under the so-called "Transportation of Explosives Act" to enforce the regulations promulgated by the Interstate Commerce Commission for the safe transportation of explosives and other dangerous articles.

(2) "That said judgment practically nullifies the powers conferred upon the Interstate Commerce Commission under Sections 1, 6, 13, and 15 of the Act to Regulate Commerce, to prescribe just and reasonable rates and classifications, and just and reasonable regulations and practices affecting the manner in which the property intended for transportation shall be marked and described."

By arrangement with the Solicitor General, these questions arising under the writ will be discussed in this brief rather than in the brief filed by him on behalf of the United States.

*Principally, however, there will be presented to the court in this brief the primary contention of the Government; that is, that the Circuit Court of Appeals erred in ignoring the binding effect of the carriers' published tariff provisions requiring the shipments embraced by the*

*indictment to be described as "gasoline" for transportation purposes, irrespective of what might be their proper description chemically, or for commercial purposes.*

Incidentally, it will be shown that there was abundant evidence in the testimony of the Government's experts and in the admissions of the defendant's witnesses that for chemical, and for commercial purposes as well, the shipments covered by the indictment were gasoline.

On the other hand, this brief will not discuss the strictly jurisdictional questions raised by the motion to dismiss, these questions being fully covered by the brief filed by the Solicitor General.

#### STATEMENT OF THE CASE

Certiorari was granted to review the judgment of the Circuit Court of Appeals for the Eighth Circuit reversing and remanding for new trial a judgment of conviction on which a fine of \$99,000 had been entered by the United States District Court for the Eastern District of Oklahoma on ninety-nine accounts, charging the respondent with receiving concessions and discriminations in rates on shipments of gasoline from Kiefer, Drumright, and Jenks, Oklahoma, to its refinery at Port Arthur, Texas, in violation of the Elkins Act of February 19, 1903, 32 Stat. 847, as amended June 29, 1906, 34 Stat. 587.

The shipments in question admittedly consisted of casing-head gasoline, a condensate of casing-head gas, shipped either "weathered," or blended with naphtha,

but had been billed to respondent by its subsidiary, the Gypsy Oil Company, as "unrefined naphtha," and respondent had paid only the lower charges applicable to that commodity, instead of the higher charges applicable to gasoline.

The case is before the court upon the respondent's motion to dismiss the writ of certiorari and to affirm the judgment of the Circuit Court of Appeals on the following grounds:

(a) That this court is without jurisdiction to review by certiorari or otherwise, a judgment of the Circuit Court of Appeals in favor of a defendant in a criminal case, reversing a conviction in a District Court.

(b) That even if this court has such jurisdiction in a proper case, it is not exercisable in this case, because the judgment of the Circuit Court of Appeals was a remand for a new trial, it being contended such judgment is not final within the meaning of Section 240 of the Judicial Code of 1911, 36 Stat. L. Chapter 231, page 1157.

(c) Because it is contended that the questions raised on certiorari are frivolous.

As already stated, this brief will not discuss grounds "a" and "b" of the defendant's motion to dismiss, except such incidental reference to ground "b" as are necessary to explain the inadvertent representation to this court in the petition for certiorari that the judgment of the Circuit Court of Appeals was one of reversal without remand for a new trial.

The defendant's motion to dismiss calls attention to the fact that in the petition for the writ, it was

represented, at least by implication, that the judgment of the Circuit Court of Appeals remanded for dismissal instead of for a new trial. In the first paragraph of that petition the judgment of the Circuit Court of Appeals is referred to as

reversing and remanding a judgment \* \* \*  
entered by the United States District Court,  
but in the fifth reason assigned for granting the petition, reference is made to

the grounds upon which that court (the Circuit Court of Appeals) reversed *and remanded for dismissal*.

The respondent's assumption, stated at page 22 of the Argument, that this erroneous representation was

doubtless inadvertently made in the absence of the mandate,

is correct. The circumstances of this inadvertent misrepresentation are too complicated to set out here, except to note that the opinion of the Circuit Court of Appeals itself reads "reversed and remanded." (Rec. 1692.) The petitioner's good faith not being questioned, it is, therefore, merely necessary to consider whether this court has jurisdiction to review a judgment of the Circuit Court of Appeals reversing and remanding for a new trial a conviction in a criminal case, and, if such jurisdiction exists, whether it should be exercised here.

It is submitted that such jurisdiction exists and should be exercised in this case. It will be demonstrated moreover, that none of the alleged errors

pointed out by the Circuit Court of Appeals constitute reversible error.

Even should this court, however, agree with the Circuit Court of Appeals that certain remarks by petitioner's counsel to the jury, and the admission of certain testimony, constituted reversible error, this court should still reform or set aside that portion of the opinion of the Circuit Court of Appeals by which that court undertakes to reverse, as without support in the evidence, the finding of the jury that the shipments were, in fact, gasoline, as charged in the indictment. That is, this court, should, in any event reverse the judgment of the Circuit Court of Appeals since it clearly appears that this portion of the opinion of the Circuit Court of Appeals, and not the other alleged errors pointed out by that Court, is the basis upon which it reversed the judgment of the District Court and the verdict of the jury. This is shown by the statement in the opinion of the Circuit Court of Appeals (Rec. 1691) that—

many errors are assigned to the admission and rejection of evidence, to the instructions of the court, to the refusal of request to instruct, and to comments by the court during the progress of the trial, which it is claimed were prejudicial and unfair, *but the view we take of the case renders it unnecessary to pass on them.*

It is our opinion that when all competent and relevant proof in the case is given a fair and impartial consideration the conclusion that the verdict is without support, is inevitable.

To proceed, therefore, to a new trial upon the basis of the opinion and judgment of the Circuit Court of Appeals as it now stands, must result in further mistrial of this case for the following reasons:

1. The Circuit Court of Appeals has clearly and unmistakably erred in holding that there was no evidence to support the jury's finding that the shipments were gasoline, as charged in the indictments, and such holding results from the arbitrary disregard by the Circuit Court of Appeals itself of competent and relevant evidence.

2. While the evidence before the court and jury was conflicting as to whether the shipments were gasoline or "unrefined naphtha," there was at least substantial evidence for the government that the shipments were gasoline. The nature of this evidence is briefly set out in the footnote.

---

NOTE.—1. The defendant's admission, and independent proof, that all of the shipments from Kiefer and Drumright consisted of casinghead gasoline, a condensate of casinghead gas, blended with painter's or similar naphtha to reduce the vapor pressure to a ten-pound maximum (R. 179, 180, 549), and that all the shipments from Jenks consisted of straight casinghead gasoline, unblended with anything, but reduced by weathering to a maximum vapor pressure of ten pounds (Rec. 179, 180, 207, 554).

2. The defendant's admission that such blending and weathering had been done to bring the shipments within the maximum vapor pressure allowed by the Interstate Commerce Commission's Transportation Regulations for the Transportation of Dangerous Articles, and by the carrier's tariffs. (Rec. 679.)

3. Proof that the carrier's published tariffs required that "condensates of casinghead gas when reduced to a maximum vapor pressure of ten pounds per square inch and shipped either alone or blended with other petroleum products, be shipped and described as gasoline, casinghead gasoline or casinghead naphtha," and that such tariffs further required the shippers to certify that the shipments were "properly described by name \* \* \* according to the regulations

3. That there being substantial evidence before the court below, and the jury having found by its verdict, under appropriate instructions, that the petitioner had proved these shipments to be gasoline beyond a reasonable doubt, the Circuit Court of Appeals could not set aside such finding of fact by the jury merely because it differed with the jury as to the preponderance of the evidence in this respect, or as to the conclusions to be drawn from such evidence, or even though it believed such evidence did not prove such shipments gasoline beyond a reasonable doubt.

4. To permit a new trial in conformance with the opinion and judgment of the Circuit Court of Appeals would necessarily result in further mistrial because the trial court under that judgment and opinion, would be required to disregard arbitrarily, as the Circuit Court of Appeals has done, the require-

---

prescribed by the Interstate Commerce Commission." (Rec. 436, 1159.)

4. Proof that the Interstate Commerce Commission's Regulations for the Transportation of Dangerous Articles made similar requirements. (Rec. 1216, 1270.)

5. Proof that the defendant's subsidiary certified on the bills of lading that the shipments were "properly described by name \* \* \* according to the regulations prescribed by the Interstate Commerce Commission." (Rec. 953, 959, 961, 963, 966.)

6. Proof, and the defendant's admission, that prior to December 2, 1916, all such shipments were billed and described by its subsidiary as gasoline (Rec. 188, 189, 208, 209) and that defendant paid the gasoline charges applicable thereto (Rec. 281).

7. Proof, and the defendant's admission that on and after December 2, 1916, when rates on "unrefined naphtha" were first published, defendant's subsidiary, without making any change whatever in the nature of its shipments (Rec. 480, 550), and by defendant's instructions, shipped and described such condensates as "unrefined naphtha," and defendants paid only the lower rate applicable to that commodity (Rec. 280).

8. Proof, and the defendant's admission, that both prior and subsequent to December 2, 1916, all other shippers shipped and described

ments of the carrier's published tariffs that the shipments be shipped and described as "gasoline"; the similar requirements of the Interstate Commerce Commission's Regulations Transportation of Dangerous Articles; the testimony of the petitioner's expert witnesses that the shipments were gasoline, as well as the defendant's admissions referred to in the foregoing footnote.

5. To permit either the Circuit Court of Appeals or the trial court on new trial to disregard the positive requirements of the carrier's published tariffs, and of the Commission's Regulations for the Transportation of Dangerous Articles, that these shipments be shipped and described as gasoline, would be to vitiate and nullify the powers conferred on the Interstate Commerce Commission by Sections 1, 6, 13, and 15 of the Interstate Commerce Act, and practically to nullify the powers of the government under the so-called Trans-

---

similar shipments as gasoline (Rec. 427, 428), and that defendant's subsidiary itself continued to use this description in shipping similar shipments to other points (Rec. 214, 215, 479, 480, 486, 487).

9. Admissions by the defendant that the word "gasoline" had been erased from certain book records of such shipments subsequent to inspection by an examiner of the Interstate Commerce Commission, and prior to the production of the books before the grand jury, and subsequent admission that the erasures had been made by employees of the defendant. (Rec. 507, 511, 512.)

10. Proof that headings of certain of defendant's lists of these shipments had been cut off, but that letters written by defendant's Port Arthur office to defendant's Pittsburgh office referred to these same shipments as Kiefer "gasoline." (Exhibits 80, 81, Rec. 1354-1358; also Rec. 521-533.)

11. Testimony of expert witnesses for the government that such shipments were gasoline. (Rec. 822-842; 852-878; 878-892.)

12. Admissions of defendant's expert witnesses that such shipments were popularly known as gasoline. (Rec. 694.)

13. Letters of defendant's traffic manager Ellis describing such shipments as "gasoline" in asking reduction of rates thereon. (Rec. 1293, 1294, 1363, 1364, 1365, 1366, 1367, 1376, 1377.)

portation of Explosives Act, Criminal Code Section 233-236, 35 Stat. L. 1134, to enforce the regulations promulgated by the Interstate Commerce Commission for the safe transportation of Explosives and other dangerous articles.

Before discussing the issues raised by the defendant's motion to dismiss and affirm, the petitioner believes it will be helpful to the court to make a brief statement of the facts.

Defendant and the Gypsy Oil Company are both subsidiaries of the Gulf Oil Corporation, but for convenience the Gypsy Oil Company is herein referred to as defendant's subsidiary. The Gypsy Oil Company produced casing-head gasoline, a condensate from casing-head (petroleum) natural gas at its compression plants at Kiefer, Drumright, and Jenks, Okla. It is important that the court keep in mind that all of the shipments covered by the indictment were *southbound* shipments of this casing-head gasoline, either straight or blended with naphtha, and that the indictments are in no way concerned with the *northbound* shipments of the naphtha used for such blending. All of the shipments from Jenks, Okla., were *southbound* shipments of straight casing-head gasoline *unblended with anything else whatever*, the vapor tension of which had been reduced by weathering to a maximum of ten pounds in order to comply with the requirements of the carrier's tariffs, and of the Transportation of Explosives Regulations of the Interstate Commerce Commission, already referred to in the foregoing footnote. All of the shipments from Kiefer and Drumright were *southbound* shipments of casing-

head gasoline blended with naphtha to similarly reduce their vapor tension to a maximum of ten pounds. The blend was about 65 per cent casing-head gasoline and 35 per cent naphtha. By a reference to the foregoing footnote it will be seen that the carrier's tariffs and the Commission's Transportation of Dangerous Articles regulations required that—

Condensates of casing-head gas when reduced to a maximum vapor pressure of ten pounds per square inch and shipped either alone or blended with other petroleum products, be shipped and described as gasoline, casing-head gasoline, or casing-head naphtha.

That footnote further shows that the defendant's subsidiary certified on its bills of lading that the shipments were

properly described by name \* \* \* according to the regulations prescribed by the Interstate Commerce Commission.

The naphtha used for this blending at Kiefer and Drumright consisted of painter's or other heavy naphtha shipped by the defendant *northbound* from its refinery at Port Arthur to its subsidiary's compression plants at Kiefer and Drumright. The blending of painter's or other heavy naphtha with the more volatile casing-head condensate, reduced the vapor tension of the latter to the required maximum of ten pounds.

The indictments are in no way concerned with these *northbound* shipments of naphtha. The indict-

ments are for describing the *southbound* shipments of straight casing-head gasoline, or casing-head gasoline blended with this naphtha as "unrefined naphtha" instead of as "gasoline," as required by the carrier's tariffs and the Transportation of Dangerous Articles regulations of the Interstate Commerce Commission.

Defendant admits that prior to December 2, 1916, all of the *southbound* shipments by its subsidiary to it of casing-head gasoline weathered or blended, were billed and described in its subsidiary's bills of lading as "gasoline," and that the defendant paid the charges applicable to gasoline. On December 2, 1916, however, there became effective in the carrier's tariffs lower rates applicable to a commodity therein designated as "unrefined naphtha." The rate from Kiefer, for instance, on gasoline was 33 cents per 100 pounds and the rate on unrefined naphtha was 19½ cents. The rates from Drumright and Jenks on gasoline and unrefined naphtha, respectively, bore substantially the same relationship. The circumstances attending the publication of these lower rates on "unrefined naphtha" will be briefly referred to. First, however, the court should note that the defendant unqualifiedly admits that, without any change whatever in the character of the shipments, the defendant's traffic manager, who was also traffic manager of its subsidiary, the Gypsy Oil Company, ordered the Gypsy Oil Company thereafter to ship and describe such shipments as "unrefined naphtha"; that the Gypsy Oil Company accordingly so changed its shipping orders and descriptions for such shipments

from "gasoline" to "unrefined naphtha," though continuing to certify that they were

properly described by name \* \* \* according to the regulations prescribed by the Interstate Commerce Commission,

and that the defendant thereupon paid only the lower rates applicable to unrefined naphtha instead of the higher rates applicable to gasoline. The defendant further admits that all other shippers both before and after December 2, 1916, shipped and described similar shipments between the same points, and between other points, as "gasoline." It contends, however, that this admission is irrelevant because neither the defendant's knowledge of, nor any connection with such shipments by other producers of casinghead gasoline was shown.

The record further contains letters from one Ellis, Traffic Manager of the defendant written during the two years preceding December 2, 1916, during which he was attempting to obtain a reduction on the northbound rates on *naphtha* to Kiefer and Drumright, and a reduction in the southbound rates on the *gasoline* from Kiefer and Drumright. These letters will be further discussed. It will then be noted that Mr. Ellis specifically describes the *southbound* shipments as "gasoline," and describes as "naphtha" only the *northbound* shipments of naphtha used for blending with the southbound gasoline. It will also be noted that after the carriers had refused to reduce even the northbound rates because involving a reduction on a *refined product*, Ellis, in order to persuade them to

make such a reduction, represents that there will be two *southbound* shipments of "*gasoline*" for each *northbound* shipment of "*naphtha*." It further appears that the rate on "*unrefined naphtha*" was finally published on a request from Ellis for a rate under such designation, but that the carrier's traffic men responsible for the publication of the rate, testified that they did not know to what character of shipments Ellis intended to apply the rate, assuming that any shipments made would come within that description.

This brief statement of facts is merely for the preliminary information of the court, and it will be necessary to consider the evidence in some detail in demonstrating the error of the Circuit Court of Appeals in holding that the verdict of the jury was without support in the evidence.

## I

There was at least substantial evidence to support the jury's verdict that the shipments were gasoline, as charged in the indictment, and were not unrefined naphtha, as billed by the shipper. The evidence was, in fact, conclusive in this respect.

The Director-General desires to make clear at the outset that, for the purposes of this writ, it is not necessary to demonstrate to this court that the evidence before the jury established conclusively and beyond reasonable doubt that the shipments consisted of gasoline, as charged in the indictment, and not of unrefined naphtha, as billed by the shipper, under the directions of the defendant. The Director General submits that the error of the Circuit Court

of Appeals will be established if it is shown that there was substantial evidence to this effect before the jury. If there was such substantial evidence neither the Circuit Court of Appeals nor this court could, under the law, disregard and set aside the jury's finding that the shipments consisted of gasoline, as charged, even though the Circuit Court of Appeals or this court should differ with the jury as to the preponderance of the evidence, or the conclusions to be drawn therefrom, or as to whether the evidence established such fact beyond a reasonable doubt.

As the Director General understands the law, the verdict of the jury in this case that the shipments were gasoline, found under appropriate instructions by the court that—

unless you find from the evidence beyond a reasonable doubt that the commodity so shipped and so received by the defendant was gasoline, it is your duty to find the defendant not guilty (Rec. 917)—

could not be set aside by an appellate court unless the court would be warranted in saying that as a matter of law the evidence before the jury *could not* establish such fact. The Director General understands that while the trial court may instruct a verdict for the defendant at the close of the government's case, or at the close of all the testimony, if the evidence before the jury could not, as a matter of law, support a verdict of guilty, an appellate court can not *after* submission of the question to the jury under appropriate instructions, set aside the jury's verdict merely

because there was a conflict in the evidence, and because the appellate court might differ with the jury as to the conclusions to be drawn from the evidence. (Encyclopedia, U. S. Supreme Court Citations, vol. 11, p. 935; *Sparf & Hansen v. U. S.*, 156 U. S. 51, 99-100.)

A consideration of the evidence, however, before the jury will demonstrate in this case that *the jury was justified beyond a reasonable doubt* in finding that the shipments consisted of gasoline. It will further demonstrate that the conclusion of the Circuit Court of Appeals to the contrary resulted from an arbitrary disregard of competent evidence under a misapprehension of the law, and from a misconception of the true significance of much of the defendant's evidence which the Circuit Court of Appeals considered required an opposite conclusion to that reached by the jury.

The substantial and, indeed, conclusive nature of the evidence before the jury upon which it found that the shipments consisted of gasoline as charged has already been outlined in the footnote on page 7. It will conduce to the convenience of the court to discuss the evidence substantially under the headings indicated in that footnote.

- (a) **THE EVIDENCE SHOWS THAT THE CARRIER'S PUBLISHED TARIFFS REQUIRED THAT CONDENSATES OF CASINGHEAD GAS, WHEN REDUCED TO A MAXIMUM OF TEN POUNDS PER SQUARE INCH AND SHIPPED EITHER ALONE OR BLENDED WITH OTHER PETROLEUM PRODUCTS, BE SHIPPED AND DESCRIBED**

AS GASOLINE, CASINGHEAD GASOLINE, OR CASING-HEAD NAPHTHA, AND FURTHER REQUIRED THAT THE SHIPPER CERTIFY THE SHIPMENTS TO BE "PROPERLY DESCRIBED BY NAME \* \* \* ACCORDING TO THE REGULATIONS PRESCRIBED BY THE INTERSTATE COMMERCE COMMISSION."

THE EVIDENCE FURTHER SHOWS THAT DEFENDANT'S SUBSIDIARY UNDER DEFENDANT'S INSTRUCTIONS SO CERTIFIED ON ITS BILLS OF LADING.

THE INTERSTATE COMMERCE COMMISSION'S "REGULATIONS FOR THE TRANSPORTATION OF DANGEROUS ARTICLES OTHER THAN EXPLOSIVES BY FREIGHT" MADE SIMILAR REQUIREMENTS.

The outstanding feature of the opinion of the Circuit Court of Appeals is, as was noted in the petition under which this court granted the writ of certiorari, the failure of the Circuit Court of Appeals even to mention these requirements of the carrier's tariffs and of the Commission's regulations. This is the more remarkable since not only was there abundant and independent proof, but the defendant admitted, that all of the southbound shipments from Jenks consisted of casinghead gasoline unblended with anything whatever (Rec. 179, 180, 207, 554), while there was like proof and like admissions that its shipments from Kiefer and Drumright consisted of casinghead gasoline blended with painter's naphtha (179, 180, 549). Without making any question of these facts, the record shows that the defendant simply contended that it was justified in describing such shipments of casinghead gasoline, blended or unblended, as "unrefined naphtha."

Supplement 5 to Western Classification No. 55,<sup>1</sup> effective August 29, 1918, provided as follows:

(k) Liquid condensates from natural gas of oil wells, made either by the compression or absorption process, alone or blended with other petroleum products, must be described as + liquified petroleum gas when the vapor pressure at 100 degrees F. (90 degrees F., Nov. 1st to March 1st) exceeds ten pounds per square inch.

*When the liquid condensate, alone or blended with other petroleum products, has a vapor pressure not exceeding ten pounds per square inch, it must be described and shipped as gasoline, casinghead gasoline or casinghead naptha.* [Italics ours.]

\* \* \* \* \*

*When the liquid condensate, alone or blended with other petroleum products, has a vapor pressure not exceeding ten pounds per square inch, it must be described as gasoline, casinghead gasoline, or casinghead naptha, and must be shipped in metal drums or barrels complying with Specification No. 5; or in ordinary tank cars, sixty pounds test class, equipped with mechanical arrangements for closing of dome covers, as specified in Masyer Car Builders' specifications for tank cars.*

---

<sup>1</sup> The carrier's tariffs under which the shipments embraced by the indictment moved were all subject to the Western Classification. See, for instance, Southwestern Lines Tariff No. 26 T, Supplement 52 (Rec. 1038), effective November 16, 1916, which provides:

"Governed except as otherwise provided herein by Western Classification No. 54 \* \* \* or reissues thereof."

Also Supplement No. 53 to the same tariff (Transcript 1041), making similar provision. The prior and subsequent issues and supplements of these tariffs in the record are too numerous to give all record references. However, all the applicable tariffs contained this provision.

Both Western Classification No. 55, as well as Western Classification No. 54, and its supplements, contain in addition, the following provisions:

### GENERAL RULES

"1711. Carriers that are subject to the Act to Regulate Commerce *must not receive* shipments of articles defined as dangerous by these regulations, when the shipments are not packed, marked, labeled, *described*, and certified as prescribed herein.

\* \* \* \* \*

NOTE.—Rule 44 of Western Classification No. 54 and its supplements, which was effective during the prior period of the indictment, carried substantially the same rule, which, however, read as follows (Rec. 1079):

"(k) Liquid condensate from natural gas or from casinghead gas of petroleum oil wells whose vapor tension at 100 degrees F. (90 degrees F., Nov. 1 to March 1st) exceeds ten pounds per square inch, must be described as liquefied petroleum gas.

\* \* \* \* \*

"When the condensate, blended or unblended, with other products has a vapor tension as above defined, not exceeding ten pounds per square inch, and is shipped as 'gasoline' in an ordinary tank car, sixty pounds test class, defined in Master Car Builders' Association specifications for tank case, the safety valves of such a car must be set to operate at twenty-five pounds per square inch, with a tolerance of one pound above or below, etc."

Western Classification No. 54 and its supplements also contain the following provision under the heading:

#### *List of principal dangerous articles*

Names of dangerous articles.	References for packing requirements, paragraph numbers, remarks for information, and rules for exceptions of similar articles.
* * *	* * * * *
Gasoline (see Note 1)	Pars. 1807 (c), 1822, 1824 to 1827. Gasoline made by compressing natural gas or by blending liquefied petroleum gas with refinery gasoline or naphtha may be described and shipped as gasoline, provided the vapor pressure does not exceed 10 pounds per square inch.

The above provision was also carried in Supplement 5 to Western Classification 55, and subsequent supplements. (Rec. 1150, 1151.)

"1712. All shipments of articles subject to these regulations offered for transportation in interstate commerce, must be properly described by the shipper in his shipping order and bill of lading, under the specific or general name provided for the description of such freight by the carrier's classification and tariff governing.

"The same description of contents must be plainly marked on the outside of each package." (Western Classification No. 55, Rec. 1143; Western Classification No. 54, Rec. 1066.)

#### LIST OF PRINCIPAL DANGEROUS ARTICLES

(d) A shipment described under a definite and proper name not in the following list and on a shipping order with no notation as to labels applied and no shipper's certificate, will be assumed by the carrier in the absence of knowledge to the contrary, to be not dangerous under these regulations.

(NOTE.--The name "unrefined naphtha" does not appear in the list referred to.) (Western Classification No. 55, Sup. 5, Rec. 1147; Western Classification No. 54, Rec. 1069.)

All of these provisions were tariff publications of the provisions of the Interstate Commerce Commission's "Regulations for Transportation of Dangerous Articles other than Explosives by Freight," originally effective October 1, 1914 (Rec. 1216 to 1240) and the amended regulations (Rec. 1241 to 1270).

It was admitted, as well as independently proved, as already noted, that the shipments from Kiefer, Drumright, and Jenks consisted of--

Liquid condensates from natural gas of oil wells made \* \* \* by the compression \* \* \* process \* \* \* alone or blended with other petroleum products (having) a pressure not exceeding ten pounds per square inch. (Rec. 179, 180, 207, 554, 549.)

In other words, the shipments came precisely within the provisions of the Western Classification, requiring that such shipments—

must be described and shipped as gasoline, casinghead gasoline, or casinghead naphtha.

Under the further requirements of the Western Classification already noted that—

all shipments of articles subject to these regulations offered for transportation in interstate commerce, must be properly described by the shipper in the shipping order and bill of lading, under the specific or general name provided for the description of such freight by the tariff classification and tariff governing—

the only description by which they could be so shipped was "gasoline," as the carrier's tariffs contain no specific rates on casinghead gasoline or casinghead naphtha. Equally, of course, billing such shipments as "unrefined naphtha" was a clear violation of the Western Classification.

The binding effect of such tariff provisions upon shipper and carrier alike is so clearly established in this court as hardly to necessitate citation. (*International Coal case*, 230 U. S. 184, page 197; *Erie Railroad Co. v. Stone*, 244 U. S. 322, pages 335-336;

*Davis v. Henderson*, United States Supreme Court, decided October 27, 1924.)

That to permit the Circuit Court of Appeals to ignore completely, as it has done, these binding tariff provisions must result in vitiating not only the most important provisions of the Interstate Commerce Act, but must, as well, practically nullify the powers of the government under the Transportation of Explosives Act, will subsequently be shown. What it is desired here to point out is that such tariff provisions, and such transportation regulations by the Interstate Commerce Commission, constituted at least some substantial evidence that these shipments were for transportation purposes, and within the meaning of the carrier's tariffs, "gasoline," and could not be "unrefined naptha." What will be further elaborated is that the conclusion of the Circuit Court of Appeals to the contrary is due not only to the ignoring of these tariff provisions and transportation regulations, but to its failure to appreciate that the question before the jury was not what these shipments might be in a technical, chemical sense, but what they were within the meaning of the tariffs for rate purposes.

It should perhaps be noted that the phraseology of paragraph (k) of Rule 44 to Western Classification No. 54 and of its supplements, was not so definite as Supplement 5 to Western Classification No. 55 in requiring that liquid condensates, blended or unblended, when reduced to a vapor pressure not to exceed ten pounds

*be described as gasoline, casinghead gasoline or casinghead naphtha,"*

which was the specific wording of Supplement 5.

As shown by the footnote on page 19, paragraph (k) of Rule 44, Western Classification No. 54 and its supplements provided:

When the condensate blended or unblended with other products has a vapor tension as above defined not exceeding ten pounds per square inch, and *is shipped as gasoline* in an ordinary tank car \* \* \* the safety valves of such cars must be set, etc.

However, as shown by the same footnote, Western Classification No. 54 and its supplements, as well as Supplement 5 to Western Classification No. 55, all carried the following provision as well:

*List of principal dangerous articles*

Names of dangerous articles.	References for packing requirements, paragraph numbers, remarks for information, and rules for exceptions of similar articles.
* * *	* * *
Gasoline (see Note 1)---	Pars. 1807 (c), 1822, 1824 to 1827. Gasoline made by compressing natural gas or by blending liquefied petroleum gas with refinery gasoline or naphtha <i>may be described and shipped as gasoline</i> , provided the vapor pressure does not exceed 10 pounds per square inch.

There was some suggestion by defendant's counsel on trial that the use of the word "may" in this latter provision, instead of "must" was permissive, and did not require such shipments to be described as gasoline. (Rec. 433, 434.) The court, however, considered the provisions as obviously mandatory

(Rec. 434), since intimately connected with safety of transportation.

The court's view is corroborated by General Rule 1711, already quoted and contained in Western Classification No. 54, as well as Western Classification No. 55, that—

Carriers \* \* \* *must not receive shipments of articles* defined as dangerous by these regulations when shipments are not packed, marked, labeled, *described*, and certified as prescribed herein.

Clearly, therefore, the provisions that "gasoline" made by compressing natural gas, or by blending liquefied petroleum gas with refinery gasoline or naphtha, *may* be described and shipped as gasoline is mandatory, since otherwise, under the rules in question, it could not be shipped at all.

Furthermore, the defendant's Vice President Tabor admitted (Rec. 679) that the weathering of the shipments of casinghead gasoline from Jenks, and the blending of shipments of casinghead gasoline from Kiefer and Drumright, was to conform to these regulations.

Any contention, therefore, by the defendant that it could, by the simple device of shipping and describing such condensates, blended or unblended, as "unrefined naphtha" instead of as gasoline, escape the whole intent and purpose of the Western Classification provisions, and of the Commission's Regulations for the Transportation of Dangerous Articles, hardly deserves serious consideration.

In any event, the Circuit Court of Appeals itself made no attempt to distinguish in this respect between shipments in the indictment prior to the effective date of the more specific language of Supplement 5 to Western Classification No. 55, and shipments on and after that date.

The Director General therefore submits that the provisions of the Western Classification, the similar provisions of the Commission's Regulations for the Transportation of Dangerous Articles, and the admitted conduct of the defendant itself in connection with such tariff provisions and such transportation regulations, alone furnishes practically conclusive evidence that the commodity shipped by the defendant was "gasoline," as found by the jury.

- (b) THE EVIDENCE SHOWED, AND THE DEFENDANT ADMITTED, THAT PRIOR TO DECEMBER 2, 1916, EXACTLY SIMILAR SHIPMENTS TO THOSE COVERED BY THE INDICTMENT WERE BILLED TO IT BY ITS SUBSIDIARY DESCRIBED AS "GASOLINE," AND THAT DEFENDANT PAID THE GASOLINE CHARGES APPLICABLE THERETO, BUT THAT ON AND AFTER DECEMBER 2, 1916, THE DEFENDANT'S SUBSIDIARY, WITHOUT MAKING ANY CHANGE WHATEVER IN THE NATURE OF ITS SHIPMENTS, SHIPPED AND DESCRIBED THEM AS "UNREFINED NAPHTHA," AND DEFENDANT PAID ONLY THE LOWER RATE APPLICABLE TO THAT COMMODITY.

As has been seen under the foregoing subheading, the defendant admitted that its southbound shipments of casinghead gasoline from Kiefer and Drumright to Port Arthur were blended with naphtha, and that its southbound shipments from Jenks of casinghead gasoline, unblended, were "weathered," in order to bring them within the Interstate Com-

merce Commission's transportation requirement of a maximum vapor pressure of 10 pounds, in which case the Transportation Regulations, as well as the tariff requirements of the carrier's Western Classification, required them to be shipped and described as gasoline, casinghead gasoline, or casinghead naphtha.

It has furthermore been seen that the defendant certified that all these shipments were described as required by the Interstate Commerce Commission's regulations. Nevertheless, the defendant admits that prior to December 2, 1916, exactly similar shipments to those covered by the indictment were billed and described by its subsidiary as "gasoline" (Rec. 188, 189, 208, 209), and that the defendant paid the gasoline charges applicable thereto. (Rec. 281.) It further admits that on and after December 2, 1916, when rates on unrefined naphtha were first published, the defendant's subsidiary, *without making any change whatever in the nature of its shipments* (Rec. 480-550), shipped and described its shipments as "unrefined naphtha," and the defendant paid only the lower rate applicable to that commodity. (Rec. 280.)

It further appears that one Donovan was general superintendent of the gasoline department of both the Gulf Refining Company and the Gypsy Oil Company, and that he reported to Mr. Tabor, who was Vice President of the Gulf Company, and that Mr. Ellis was Traffic Manager for both Companies. (Rec. 246, 248.) Moreover, it was admitted Mr. Ellis, as Traffic Manager of the Gulf Company, in-

structed Donovan how to ship the product in question. (Rec. 484.)

The defendant attempts to explain this change in description and to mitigate its force as an admission as to the real character of the shipments, by contending that prior to December 2, 1916, there was no rate on "unrefined naphtha" from Kiefer, Drumright, or Jenks to Port Arthur. It has already been seen, however, that the defendant's subsidiary, both prior to December 2, 1916, and subsequent to that date, certified that its shipments were—

properly described by name \* \* \* according to the regulations prescribed by the Interstate Commerce Commission,

and there is no pretense that there was any difference in the requirements in this respect of the Western Classification, or of the Commission's transportation regulations prior and subsequent to December 2, 1916, at least until the effective date of Supplement 5 to Western Classification No. 55, August 29, 1918. Yet it has been seen that the change in the description of the defendant's shipments was not coincident with the change in the Western Classification in August, 1918, but with the publication by the carriers in December, 1916, of a lower rate from Kiefer, Drumright, and Jenks to Port Arthur on a commodity designated as "unrefined naphtha" than applied between the same points on "gasoline."

It is the circumstances, however, in connection with this very publication of a rate on a commodity designated as "unrefined naphtha" from Kiefer, Drum-

right, and Jenks to Port Arthur, which furnish a conclusive answer to the defendant's attempt to mitigate the force of the admission involved in their prior designation of their shipments as "gasoline." These circumstances are shown in certain letters passing between the defendant's traffic manager Ellis and the carrier's officials responsible for the final publication of a rate on a commodity designated as "unrefined naphtha," together with the testimony of certain of the officials themselves, which will subsequently be discussed in greater detail. It will suffice to say here that Ellis' original request was for a reduction in the rate on "gasoline" from Kiefer, Drumright and Jenks *southbound*, and for a reduction on the rate on "naphtha" *northbound* only, and that the testimony of the traffic officials shows that when a rate on a commodity designated as "unrefined naphtha" from Kiefer, Drumright, and Jenks to Port Arthur was published, the traffic officials themselves did not know to exactly what commodity the defendant intended to apply the rate, or to what commodity the defendant, in fact, applied it. (Rec. 571, 573 to 576.)

(c) **THE EVIDENCE SHOWED THAT BOTH PRIOR AND SUBSEQUENT TO DECEMBER 2, 1916, ALL OTHER SHIPPERS SHIPPED AND DESCRIBED SIMILAR SHIPMENTS AS GASOLINE BETWEEN THESE SAME POINTS AND OTHER POINTS AS WELL, AND THAT THE DEFENDANT'S SUBSIDIARY ITSELF, EVEN AFTER THAT DATE, CONTINUED TO USE THIS DESCRIPTION IN SHIPPING SIMILAR SHIPMENTS TO OTHER POINTS.**

After one League, an inspector of the Bureau of Explosives, had testified (Rec. 409) that he had inspected practically all casinghead gasoline compression plants throughout the country, including

Oklahoma, Wyoming, Pennsylvania, West Virginia, Illinois, and Ohio, and after general testimony that all these plants shipped and described casinghead gasoline, blended or weathered, to a maximum vapor pressure of ten pounds, as gasoline, and after starting to enumerate all such plants that he had inspected in Oklahoma, he was stopped by Mr. Swacker, of counsel for the defendant, with the statement that the defendant would admit that League would testify that all other shippers shipped and described such shipments as gasoline. (Rec. 427.) Mr. Swacker, however, objected to the relevancy of the testimony and of the admission on the ground that, so far as the defendant was concerned, it was hearsay evidence and could not be used as an admission against it of the character of the shipments. The admission of this evidence is one of the alleged errors which the opinion of the Circuit Court of Appeals states (Rec. 1691):

would require a reversal,  
but none of which it appears were the actual basis of reversal, since, as has been noted, the Circuit Court of Appeals actually reversed solely on the ground that the evidence did not support the jury's finding that the shipments consisted of gasoline.

It is desired to point out, however, that even assuming that it would have been error to have admitted this testimony as an admission against the defendant of the character of the shipments, it was admissible as evidence of the general transportation and trade designation of the commodity.

Moreover, the Circuit Court of Appeals is in error in stating in the same portion of its opinion, that this evidence was admitted

without a showing that they (shipments of other manufacturers) were substantially similar to those of the Gypsy Company. (Rec. 1691.)

A reference to League's testimony, particularly at pages 447 to 451, will show that League testified that

the commodity shipped by the Gypsy was practically of the same character as that shipped by other people,

and is so quoted by defendant's counsel himself. It is true that by the skillful, misleading questions of defendant's counsel (Rec. 447 et. seq.) the witness was led into saying that there "might have been" a variation in the amount of blending material. He testified, however, unequivocally (Rec. 448) that he never heard anyone except the Gulf Refining Company and its employees refer to such blended shipments as "unrefined naphtha," but that they were invariably called by everyone else "gasoline," and (Rec. 450 and 451) that he had never seen this blended commodity described in any billing and shipping orders to any other refinery than that of the defendant, as "unrefined naphtha."

Furthermore, the Circuit Court of Appeals misconceived the true significance of League's testimony that the blend of certain other shippers who shipped and described the blended commodity as "gasoline," contained as much as 75 per cent naphtha. The Circuit Court of Appeals says (Rec. 1691):

that testimony was admitted \* \* \* in the face of proof that they were not of uniform blend with those of the Gypsy Company, but contained, in one instance, as much as 75 per cent naphtha.

The only even plausible theory upon which the defendant itself can justify describing its shipments as "unrefined naphtha," is because of the blending of the casinghead gasoline with the heavy naphtha shipped north from Port Arthur for that purpose, the defendant's contention being that such naphtha used for blending was not refined naphtha, but crude, heavy or painter's naphtha. Of course, on this theory, the more naphtha in the blend, the more plausible becomes the defendant's excuse for calling the blend "unrefined naphtha." Therefore, League's evidence that the blended commodity of other shippers, even where the proportion ran to 75 per cent, was still invariably called "gasoline," only makes League's testimony the stronger against the defendant.

(d) **THE EVIDENCE SHOWED ADMISSIONS BY THE DEFENDANT THAT THE WORD "GASOLINE" HAD BEEN ERASED FROM CERTAIN BOOK RECORDS OF THE SHIPMENTS EMBRACED BY THE INDICTMENT SUBSEQUENT TO INSPECTION BY AN EXAMINER OF THE INTERSTATE COMMERCE COMMISSION, AND PRIOR TO THE PRODUCTION OF THE BOOKS BEFORE THE GRAND JURY, AND A SUBSEQUENT ADMISSION BY THE DEFENDANT THAT THE ERASURES HAD BEEN MADE BY AN EMPLOYEE OF THE DEFENDANT.**

The Circuit Court of Appeals says in its opinion, Rec. 1682, 1683:

It was shown, and the fact emphasized by the prosecution, that some of the Gulf Refining

Company's records which showed the receipt of the commodity at Port Arthur in the early part of 1917, described it as "Kiefer Gasoline," and that the word gasoline in many instances had been erased, and that the books were in that condition when they were presented to the grand jury. It was not shown who kept the books, nor who made the erasures.

It is quite impossible to explain upon what basis the Circuit Court of Appeals felt warranted in stating, as shown above, that

it was not shown who kept the books, nor who made the erasures.

The record shows, page 507, the following:

Mr. DIGGS, of counsel for the defendant. The defendant will admit, at the time of the surrender of these books to the United States authorities at Muskogee, to be used before the grand jury, that these erasures appeared in them.

Mr. PAYNE (of Counsel for the Government). Your honor, I ask leave to ask him (Stewart, Agent of the Interstate Commerce Commission, who had examined the books) a couple of more questions, and then put Mr. Gann on the stand.

The COURT. No; they admitted that these erasures appeared on the books, and appeared there when the books were delivered into the possession of the Government, and came from their possession.

Mr. DIGGS. That is all right.

The record then shows, pages 508 to 511, numerous places where such erasures had been made, and then on page 511, a further admission by Mr. Diggs, reading as follows:

Mr. DIGGS. Before we proceed, I have a statement I would like to make to the court. I desire to state to the court that the erasure of the word gasoline in the items forming the word Kiefer gasoline in Government's Exhibit 77 and 78 first came to my knowledge before the book was surrendered to the United States authorities at Muskogee for the use before the grand jury. My attention was directed to the erasures and explanation given to me, the erasures were made contemporaneously with the entries, and for the purpose of making them speak the truth, and it was not until after the adjournment at noon to-day that we discovered that they were otherwise made and now for the first time we have information that leads us to believe *that these erasures were made by an employee of the Gulf Refining Company subsequent to the beginning of the investigation by the Government, and we now make this statement so the court can be thoroughly informed of the actual conditions, and also make it to be used as an admission in this case in so far as it may be pertinent subject to inquiry.*

The record then shows, page 511, that Mr. Chambers, who was also of counsel for the Government, objected to this admission being made before the jury in the middle of testimony from which the jury

most apparently must necessarily reach the very conclusion which the defendant offered to admit, Mr. Chambers' idea obviously being that the admission was made in the hope of avoiding the still more unfavorable effect on the jury of the Government's incontrovertible evidence of the facts. Mr. Diggs then stated:

I am not offering it to the jury in the trial of this case, but I am offering it to the court, so the court will understand the condition.

The COURT. I will exclude the statement at this time from the consideration of the jury.

The Government then introduced further testimony by the Witness Otey, a laboratory inspector of the Gulf Refining Company at Port Arthur, proving the handwriting of the entries to be those of one Koontz, another employee of the Gulf Refining Company, and proving innumerable erasures of the word "gasoline" following the word "Kiefer." (Rec. 512 to 521.)

The admission of defendant's counsel, and the independent testimony in this respect, speak for themselves, and further comment on this portion of the opinion of the Circuit Court of Appeals would appear superfluous.

- (e) **THE EVIDENCE SHOWS THAT HEADINGS OF CERTAIN OF DEFENDANT'S RECORDS OF THE SHIPMENTS EMBRACED BY THE INDICTMENT HAD BEEN CUT OFF, BUT THAT LETTERS WRITTEN BY DEFENDANT'S PORT ARTHUR OFFICE TO DEFENDANT'S PITTSBURGH OFFICE REFERRED TO THESE SAME SHIPMENTS AS KIEFER "GASOLINE," AND THAT APPARENT DUPLICATES OF SUCH RECORDS ATTACHED TO SUCH LETTERS BORE HEADINGS READING "RECEIPTS OF KIEFER GASOLINE."**

In the same portion of the opinion of the Circuit Court of Appeals just commented upon, it is stated (Rec. 1683):

It was also shown that the heading on a number of pages listing shipments of the commodity from Oklahoma to Pittsburgh, had been cut off, and that letters written to the Pittsburgh office in connection therewith, referred to some of the shipments as Kiefer gasoline. These erasures and changes were characterized as admissions and introduced as such.

It is difficult to tell from this statement whether the Circuit Court of Appeals considered the admission of the testimony referred to at page 1691 of the record, as one of the assignments that—

are in our judgment meritorious \* \* \*  
and would require a reversal. (Rec. 1691.)

If so, the Circuit Court of Appeals has stated no ground for such a holding, and it is submitted that there was abundant justification for permitting such evidence to go to the jury as evidence of the defendant's actual knowledge of the real character of their shipments covered by the indictment, and evidence of its attempt to conceal such knowledge. That part of the Government's Exhibit 80, which appears at Rec. 1330, was a sheet containing a list of cars showing "outages," etc., for the month of April, 1917. This sheet appears to have been made in duplicate, and the heading had been cut off of the copy as handed to the Government agent. In response to a subpoena *duces tecum*, the other copy was turned over to the

Government during the trial, and that copy is in evidence as Government Exhibit 81 and 82. (Rec. 1354 to 1358.) Exhibit 81 is a letter addressed to the defendant's auditor at Pittsburgh, and begins:

Our April oil statement will show as a receipt,  
146 cars of *gasoline* from Kiefer, etc.—

and Exhibit 82, which is the list attached to Exhibit 81, is apparently a duplicate of Exhibit 80, and is headed:

“Receipts of Kiefer Gasoline, April 1917.” •  
(See testimony Interstate Commerce Inspector  
Stewart, Rec. 429 to 431.)

It is difficult to understand on what ground the Circuit Court of Appeals could have considered that these deliberate erasures and mutilations by defendants of records which it realized were compromising, and indeed damning, were not properly receivable as admissions against the defendant, and did not constitute some evidence at least, which would support the jury's finding that the shipments embraced by the indictment were actually gasoline, as therein charged.

(f) **EVIDENCE OF EXPERT WITNESSES FOR THE GOVERNMENT THAT SHIPMENTS EMBRACED BY THE INDICTMENT WERE GASOLINE, AND ADMISSIONS OF DEFENDANT'S EXPERT WITNESSES THAT COMMODITY SHIPPED WAS AT LEAST POPULARLY KNOWN AS GASOLINE**

The testimony of the expert witnesses both of the Government and of the defendant is so voluminous and diffuse as to make adequate discussion of it extremely difficult within any reasonable limits of this brief. It would, therefore, seem that the only practicable method of discussing this expert testi-

mony will be by outlining its general scope and the points of agreement or difference between the experts, with only such brief abstract of their testimony as will show the general conclusions here drawn from it warranted.

In general it may be said that all of the Government's experts agreed that both the shipments from Kiefer and Drumright of casinghead gasoline blended with naphtha, and the shipments from Jenks of unblended casinghead gasoline, were not only popularly known as gasoline, but were known as such throughout the gasoline industry; were chemically, and within the meaning of the tariffs as well, gasoline: and could not properly, under any circumstances, be described as "unrefined naphtha."

On the other hand, the defendant's experts, with equal unanimity, testified that the shipments were not gasoline *within their definition* of that term, and might properly be described as "unrefined naphtha."

It is, however, particularly to be noted in connection with the testimony of the defendant's experts:

First, that, without exception, they confined their definition of the term gasoline to such petroleum products as would operate an automobile or other internal-combustion engine.

Second, that no one of the defendant's experts testified that these shipments were not gasoline for transportation purposes, and within the meaning of the tariffs.

Third, that even they admitted that the blended commodity was popularly known as gasoline, and

further admitted that even in their opinion "unfinished naphtha" would have been a more appropriate name for it than "unrefined naphtha"; that their conclusion that it nevertheless might properly be called "unrefined naphtha" was based on their contention, which the Government experts denied, that "blending" was a process of "refining."

Fourth, that they, therefore, denied that either the shipments of straight casinghead gasoline, or of casinghead gasoline blended with heavier naphtha, were gasoline, on two grounds:

(a) Because they claimed, what incidentally the Government's experts controverted, that neither the blended nor unblended commodity would satisfactorily operate an automobile engine, and therefore would not come within the limited definition which they gave the term gasoline.

(b) Because they claimed that it was necessary to further blend the shipments after their arrival at Port Arthur, with additional naphtha and with refinery gasoline, in order to meet the specifications of their customers. Indeed, their counsel, Mr. Swacker, flatly claimed that no commodity was gasoline unless it fulfilled the particular specifications of a particular customer.

Fifth, and what is most significant, that none of the defendant's experts had the temerity to attempt to justify the description of the shipments of unblended casinghead gasoline from Jenks as "unrefined naphtha." Indeed, in reading the testimony of defendant's experts, one is struck by their careful

avoidance of any separate and distinct reference to these shipments of straight casing head gasoline from Jenks, unblended with any other commodity. The defendant obviously recognized the improbability of persuading the jury that these shipments, at any rate, could possibly be described as "unrefined naphtha," and, therefore, thought the less said about them the better. Moreover it will be noted that all the defendants' experts defined naphtha as a *distillate*, while casinghead gasoline is admittedly a *condensate*.

In short, it may fairly be said that the defendant's experts based their conclusions that the shipments were not gasoline, by arbitrarily limiting the meaning of that term to such "gasoline" as would satisfactorily operate an automobile engine, or fulfill the particular specifications of a particular customer, and by ignoring the definition given that term by the tariffs themselves, by the Interstate Commerce Commission for transportation purposes, by its admitted popular usage throughout the gasoline industry, and by its prior usage by the defendant itself.

Likewise, it is upon an equally arbitrary basis that the Circuit Court of Appeals chooses to disregard, and in certain respects even to misrepresent, the testimony of the Government's experts, and to adopt the conclusions of the defendant's experts in the face of the jury's findings and of the tariff provisions.

Before briefly abstracting the testimony of these expert witnesses, it will be helpful to give a short description of the nature and method of manufacture of casinghead gasoline; of the nature and method of manufacture of the naphtha shipped *northboun*

from Port Arthur to Kiefer and Drumright for blending with this casinghead gasoline for the *south-bound* shipments to Port Arthur, covered by the indictment and of the subsequent further blending at Port Arthur, to comply with such specifications as to gravity and volatility as particular customers of the defendant might require. The facts stated in this connection are drawn almost entirely from the testimony of the defendant's experts, or of the defendant's officials and employees who were called as witnesses by the Government, and are practically undisputed.

**NATURE AND METHOD OF MANUFACTURE OF CASING-  
HEAD GASOLINE**

Casinghead gasoline is a condensate of natural gas obtained from oil wells, and drawn off separately from the oil through a separate tube or "casing," from which it gets its name. (Rec. 186.) The casinghead gas is passed through a compressor and compressed into gasoline. (Rec. 238.) Ordinarily there are no impurities in it, except accidentally some water or crude oil might come through the gas line. As a precaution against this, the gas, before being passed through the compressor, is passed through so-called scrubbing or meter tanks, which remove any foreign substance. (Rec. 236, 552.) The defendant's admitted that their plants at Kiefer, Drumright, and Jenks used this compression method, and were casinghead gasoline plants only. (Rec. 179, 180.)

The vapor tension of the casinghead gasoline as it came from the compressor varied from 20 to 30

pounds, the specific gravity from 88 to 90, and its color was generally water white. (Rec. 242, 554.) It is invariably shipped in clean cars. X

The casinghead gasoline from Jenks was shipped to port Arthur unblended. (Rec. 207, 554.) Its vapor tension was reduced by "weathering" (exposure to the air, Rec. 213) to or below the maximum of 10 pounds, required by the Western Classification and the Commission's Regulations for the Transportation of Dangerous Articles, and varied from 7 to  $8\frac{1}{2}$  pounds (Rec. 600), its specific gravity being reduced to 77 to 80 (Rec. 599). Slater, another of the defendant's officials, says 75 to 85 (Rec. 639).

The casinghead gasoline from Kiefer and Drumright before being shipped *southbound* to Port Arthur, was blended with heavy naphtha shipped *northbound* from Port Arthur to those points for the purpose. The Kiefer blend was about  $66\frac{2}{3}$  per cent gasoline and  $33\frac{1}{3}$  per cent naphtha. The Drumright blend was about 65 per cent gasoline, and 35 per cent naphtha. The specific gravity of the blended commodity varied from about 77 to 80. (Rec. 594 to 596.) Slater says 72 to 85. (Rec. 640.) The vapor tension was about 8 pounds (Rec. 594) and the color test about 24 to 25 (Rec. 595), 25 being perfectly white, "like distilled water." (Rec. 364.)

It was this weathered unblended casinghead gasoline from Jenks, and the blended casinghead gasoline from Drumright and Kiefer, shipped southbound to Port Arthur, which was shipped by the defendant under the name of "unrefined naphtha." X

It is the Government's contention that neither the weathered casinghead gasoline, which was itself, as has been seen, a pure and refined product, nor such casinghead gasoline blended with heavier naphtha, which it will now be shown was also a refined product, could properly be described as "unrefined naphtha."

**NATURE AND METHOD OF MANUFACTURE OF NAPHTHA SHIPPED NORTHBOUND FROM PORT ARTHUR TO KIEFER AND DRUMRIGHT FOR BLENDING WITH CASINGHEAD GASOLINE**

The defendant admits (Rec. 473, 474) that the naphtha shipped northbound from its refinery at Port Arthur for blending with the casinghead gasoline at its subsidiary's casinghead gasoline plants at Kiefer and Drumright, was painter's naphtha, or of a similar grade (Rec. 474). The gravity is shown as from 53 to 54. (Rec. 243.) Defendant's counsel claimed, however, that it was not "a refined product suitable for gasoline." (Rec. 474.)

Just what this statement of defendant's counsel meant is not clear. If by it he meant that this painter's naphtha was not itself gasoline, the Government entirely agrees with him. If, however, he means that it was not a refined product suitable for blending to make gasoline, he is contradicted by Pritchard, Superintendent of the defendant's refinery at Port Arthur, who testified (Rec. 586) that additional amounts of this same painter's naphtha were used at Port Arthur itself for the final blending, to produce what the defendant itself admits was gasoline. This was also testified to by defendant's

Assistant Superintendent Slater. (Rec. 657, 658.) However, defendant's counsel himself, in connection with a previous refusal to admit that this north-bound naphtha was refined (Rec. 467) stated:

We will admit that it was a treated naphtha, and would be a sufficiently treated naphtha for some purposes, and we are perfectly willing to admit the exact character of it.

Curiously enough, the record does not show exactly where painter's naphtha stands relatively in the list of various naphthas, but the Government's expert Dykeman, testified that it underwent three refinery processes (Rec. 879), and that the putting together of two refined products, such as painter's naphtha and casinghead gasoline, could not produce an unrefined product which would justify a designation such as "unrefined naphtha."

**FURTHER BLENDING AT PORT ARTHUR TO MEET PARTICULAR SPECIFICATIONS OF DEFENDANT'S CUSTOMERS**

The defendant's Assistant Superintendent at Port Arthur, Slater, testified (Rec. 660) that the blended shipments from Kiefer and Drumright were never used at Port Arthur to fill orders for gasoline, without further blending with more painter's naphtha, and with refinery gasoline. This also was the testimony of defendant's Superintendent Pritchard. Slater testified (Rec. 659) that the proportion of casinghead gasoline in the product finally sold from Port Arthur to their customers as gasoline, was from 5 to 12 per cent. He was unable, however, to state the proportion of refinery gasoline and heavy naph-

tha, saying that all the ingredients varied to meet various specifications. Miller, an expert witness for defendants, stated that the casinghead would run from 3 to 10 per cent of the final product. (Rec. 740.) Burrell, another expert for the defendant, says 5 per cent to 30 per cent; generally 25 per cent to 30 per cent. (Rec. 701.) On the other hand, Millard, who had been Assistant Superintendent and Superintendent of the Gypsy Oil Company's casinghead gasoline plant at Kiefer, testified that the blended casinghead was marketed direct from Kiefer to customers at various places, including Saint Paul and Pittsburgh, as gasoline. (Rec. 555.) This was from 1914 to 1916, and the only difference, if any, in that product and what was shipped to Port Arthur from Kiefer, was in the different gravities that might be blended to meet the particular specifications of their customers.

It also appeared that the shipments from Kiefer, Drumright, and Jenks went directly into the gasoline tanks at defendant's refinery at Port Arthur, and that the defendant had no tank designated for "unrefined naphtha." (Rec. 656.)

#### **ADMISSIONS OF DEFENDANT'S EXPERT WITNESSES**

SLATER, Assistant Superintendent, Gulf Refining Company, Port Arthur (Rec. 630 to 667):<sup>1</sup>

Says correct name of blended casinghead gasoline as received from Kiefer "unrefined naphtha," but admits "we call it usually Kiefer gas." (Rec. 665.)

---

<sup>1</sup> Pages of record between which each expert's testimony will be found, are given immediately following each expert's name.

Admits to court that better designation for blended Kiefer casinghead gasoline would be "unfinished naphtha," rather than "unrefined naphtha." (Rec. 657.)

Admits that "may be" Kiefer casinghead gasoline is pumped directly into gasoline storage tank at Port Arthur. (Rec. 658.)

Admits doesn't know whether product similar to Kiefer casinghead gasoline is marketed as gasoline. (Rec. 663.)

Admits knows of no book where term "unrefined naphtha" is applied to casinghead gasoline. (Rec. 662.)

TABER, Vice President, Gulf Refining Company (Rec. 667 to 685; 772 to 785):

"Naphtha" term generically applied to *distillates* from crude oil above a gravity of 52; that is above kerosene. (Rec. 671.)

Term "gasoline" originally confined to that of 76 to 80 gravity used for making light, and continued so to be used until automobiles came along. (Rec. 672.) There wasn't enough of this kind of gasoline to supply them, so they had to go to the naphtha to get something heavier. Their carburetors, at that time, had been made to use this very light material, and so they had to change their carburetors to burn the heavier material, and they called that gasoline. That isn't the proper name for it from the technical standpoint. The automobile business has run away with the crude oil business, particularly with the terminology of the business. The automobile business dominates the

names used in the gasoline business, and they call the product all sorts of names. Some call it benzine because they talk about benzine buggies; some call it naphtha; some gasoline, and some use the name gas for short. We, as refiners, have to know all those names. They call it naphtha when used in a launch. (Rec. 673.)

*Gasoline in the strict technical sense of the word, is a product which is substantially 76 to 80 gravity—a refined distillate from petroleum which is suitable for use in carbureting air for making gas suitable for burning in private dwellings. That is one of the articles of commerce known as gasoline. Now there are other articles, and that has been developed by the automobile business. For that purpose we will say that gasoline is a product, a combination of products of naphtha produced from crude oil, natural gas, casinghead gas, and other sources, which are made suitable for use in the general run of automobiles which use suction carburetors. It has to be suitable, however, for such use. Casinghead gasoline produced at*

---

NOTE.—Witness here uses refining to mean the further blending performed at Port Arthur. He says blending is refining and gives the following illustration (Rec. 681):

“Sterling silver is 92½ per cent pure silver and 7 per cent copper. Now, if you have a mixture, if you have 100 pounds of what is found to be sterling silver and 7½ per cent copper, there is no extraneous matter in it, but if you happen to have 100 pounds of mixture, put out to be sterling silver, and found 8 pounds of copper, then you would have some extraneous matter. Now there would be two ways of refining that copper. One would be to take so much out of that copper so what was in there would not be more than 7½ part of the hundredth of the whole; or you could add enough pure silver to it so there would not be more than the proportion of 7½, and when you do it either way you will comply with the specifications, and either would be refining

*Kiefer, Drumright, and Jenks doesn't fulfill either of these specifications for gasoline. I do not consider it gasoline. I consider it unrefined naphtha because it requires refining to fit it for the market. (Rec. 678.)*

*Admits that casinghead gasoline is called by other people, blended gasoline, but says that defendant calls it "unrefined naphtha." (Rec. 683.)*

*Says "unrefined naphtha" is perfectly proper name for blended casinghead gasoline, but acknowledges he would prefer to call it "unfinished naphtha." (Rec. 684, 685.)*

*Furnishes bibliography of petroleum products. (Rec. 772 to 785.) Out of all the books mentioned, he admits only two mention "unrefined naphtha." He quotes only one of these two—Bacon & Hamor. (Rec. 784) as saying:*

*"Naphtha distillate (Unrefined Naphtha) as those fractions which boil up to 150 degrees C. under atmospheric pressure."*

*Witness says this definition comprehends casinghead gasoline.*

---

*it. Either taking out a part of the impurity or adding so much of a pure material to make up the specifications."*

*The witness's false analogy shows exactly why blending of casinghead gasoline with heavier naphtha and refinery gasoline at Port Arthur, is not refining. The casinghead gasoline is a more volatile and higher grade commodity. See testimony of defendant's expert Burrell. (Rec. 707.) The object of blending at Port Arthur is merely to reduce its volatility. A correct analogy, therefore, would have been a case where it was found that 100 pounds of supposed sterling silver, contained 93 pounds pure silver (casinghead gasoline), and 7 pounds of copper (less volatile naphthas). In order not to exceed sterling silver specifications, it would be necessary to get rid of the extra half pound of pure silver and replace it with half a pound of copper. This could be done either by taking out some of the silver, or adding more copper in the proper ratios. But in either event, it would not be a process of "refining," but of coarsening or debasing, not "refining."*

Obviously this is inaccurate, as casinghead gasoline is not a "naphtha distillate," but if naphtha at all, it is a naphtha "condensate."

BURRELL, Superintendent of two refining companies in no way related to defendant (Rec. 685 to 708):

Says blending is a refining process. (Rec. 689.)

Technical definition of naphtha is light *distillate* which comes off crude oil in the process of refining down to kerosene, sometimes including kerosene. This generic definition is specifically used to mean 48 to 60 gravity used to mix with natural gas gasoline in the art of blending. Also to designate painter's naphtha which has a gravity of 52 to 54.

Defines gasoline "as a liquid inflammable substance or mixture of hydrocarbons *suitable for use in an automobile to-day.*" (Rec. 691.)

Admits casinghead gasoline already partially refined in ground. (Rec. 693.)

Says blended shipments of casinghead gasoline from Kiefer and Drumright, and unblended shipments from Jenks are not gasoline, *but admits popularly called gasoline*, and that he has called them so himself, "but material I am talking about is not gasoline, and does not come under that category until properly prepared for market."

"Unrefined naphtha" is proper name for casinghead gasoline blended or unblended, *but would prefer designation "unfinished naphtha."* "Gasoline" is wrong name. (Rec. 694.) Would really like word "condensate" in speaking of natural gas gasoline.

Neither raw casinghead gasoline nor Kiefer blended casinghead gasoline will in general run a Packard or a Dodge car, and, "therefore, is not gasoline in my definition of the term." (Rec. 695.)

Not gasoline because too volatile. Similar in this respect to "still" gasoline. (Rec. 700.)

Defines "refining" as "preparation of raw material for market." Says general practice is to put 25 to 30 per cent casinghead gasoline into gasoline. Some refineries put 5, some 10, some 25, and some 30. (Rec. 701.)

First admits blending is essentially mixing (Rec. 704), and then says it is not merely mixing. (Rec. 705.)

*Admits blending does not remove any impurities.*

Admits never used term "unrefined naphtha" in any book written by him. Admits called blended material in a book written by him "blended casinghead gasoline." (Rec. 706.)

Admits that he wrote in same book:

The natural gas gasoline is not only valuable because of the product itself, but because it is of very high grade, so high in fact that it is not economical to use it alone, but so it is mixed with low grade refinery naphtha, and the so-called cracked gasoline, a great deal of which is being made at the present time.

Witness then says (Rec. 707, 708):

I will tell what I mean by the term "high grade." Automobile makers have changed their carburetors as fuel became scarcer and scarcer, until to-day that carburetor is made

to suit a much more lower grade fuel than the high grade fuel of a few years ago; so to-day the low grade fuel is a high grade fuel, because that high grade fuel of a few years ago will not operate an automobile satisfactory.  
\* \* \* High grade was used in the sense of high in gravity. High grade really conveys a wrong impression unless one is familiar with casinghead gasoline.

Q. So that in this case according to your investigation and knowledge of the situation, is it not a fact what is refined if anything, is the low grade refinery product at Port Arthur?

A. I certainly would not admit that, one helps the other. You have each to help the other. The casinghead gasoline is made available for use by motor trade and the heavy distillate is made available each helping the other. One supplies the upper range in the boiling point, that is the naphtha, and the other, the casinghead gasoline, supplies the lower range, in other words makes an automobile engine easier to start—One helps the other.

Q. Now, Mr. Burrell, is it true that what is shipped is gasoline of a very high grade, but may be properly called unrefined naphtha?

A. I would not say that. You are speaking of high grade gasoline. The material which you call high grade gasoline is really selling to-day in Oklahoma for four or five cents less than the regular automobile gasoline.

Q. Has that been just in the last few months?

A. Yes, sir.

Q. Now, wasn't that due to a particular transaction in the oil trade?

A. I don't know what caused it.

Q. Isn't that due to the fact that the Standard Oil Company made some change in its internal policy?

A. I had so heard.

\* \* \* \* \*

A. I will admit that this natural gas gasoline is a very fine material; it has helped out the automobile industry; it is very valuable but casinghead gasoline helps the naphtha just as much as the naphtha helps the other. They are invaluable to each other—You can not say that this material is not high grade (I don't mean it is low grade). It is a very valuable commodity.

Q. Now in what respect is it unrefined?

A. It is not ready for the market.

DOCTOR GARNER, Chemical Engineer (Rec. 708 to 715):

"Naphtha" generic name for everything above kerosene. Used specifically also in connection with certain grades of marketable products like naphtha "a," naphtha "b," naphtha "c," or painter's naphtha or stove naphtha, or solvent naphtha. These may be either refined or unrefined articles.

Gasoline in the strict sense must be that low boiling portion of naphtha having a gravity of 76, possibly to 82, and usable for purposes of illumination.

Definition of it as article of commerce would require witness to divide it into a number of component parts.

Witness fails to make such division but in answer to his counsel's question:

"Is gasoline a term applicable to product for use for vaporization purposes?"

"A. It is."

Also that as used commercially it is a finished product as distinguished from an unfinished product.

*Does not consider anything may be properly called gasoline that could not be used for vaporization purposes, such as running a car or gasoline stove.*

Says Kiefer, Jenks and Drumright products are not gasoline, but are "unrefined naphtha." (Rec. 711.)

Admits does not know whether casinghead gasoline is or is not the gasoline sold to-day to run gas machines.

Admits that there is a kind of gasoline called "export gasoline," which is made from casinghead gasoline blended.

Q. The gasoline to be used in a motor car is not the only kind of gasoline, is it?

A. In the common acceptation of the term, I believe that of 96 per cent of all the material used and called gasoline is used in internal combustion engines with suction carburetors.

Q. The term, however, embraces many kinds of gasoline, does it not?

A. Many kinds of gasoline—if you will say specifications of gasoline. (Rec. 712.)

Says in his definition of gasoline as composed of lowest fractions and of a gravity ranging from 76 to 82, casinghead gasoline would still not be gasoline

if it had such boiling points and gravity. Would not give same curves, and varies in amounts of constituent hydro-carbons. Says casinghead gasoline is unrefined.

SCHOCK, Chemical Engineer (Rec. 716 to 734):

The material used to-day under the word gasoline, is not identical with the material called gasoline years ago. The material now used in automobiles would then probably have been called naphtha. Gasoline originally was used in gasoline stoves, and the not differ exceedingly from the present gasoline, but in another way it does. The quality and the volatility has been steadily lowered in order to meet the greater demand. Witness won't say that twenty years ago gasoline was a different material but it was a gasoline that had a lower boiling point; was more volatile as a whole than the present gasoline. (Rec. 719.)

Gasoline was always used to be vaporized. Can not be defined in a word. It is material derived from petroleum. It is a liquid volatile, inflammable, but so made up in such proportion that a part only will volatilize when air is going through it as is done in the ordinary automobile carburetor.

In distilling crude oil the first portions that come off collectively are known as naphtha. Naphtha designates any volatile inflammable liquid hydro-carbon mixtures with a prefix added for the name of the naphtha. (Rec. 720.) The term naphtha includes any gasoline, but all naphthas are not necessarily gasoline.

Shipments from Kiefer, Drumright, and Jenks to Port Arthur are not gasoline, and appropriately described as "unrefined naphtha." (Rec. 721.)

Witness says blending is an essential operation in at least two, and probably more commodities obtained from a refinery, but unlike defendant's previous witnesses, this witness does not say that blending is refining. (Rec. 727.)

MILLER, Consulting Engineer (Rec. 735 to 747):

"Still" gasoline and casinghead gasoline are not finished gasolines, and are substantially similar. (Rec. 737.) Both must be blended with refinery gasoline to be used in automobile motors.

*Defines gasoline as being generally that fraction of crude petroleum or similar products lying within the range of boiling point and other necessary physical tests, which will satisfactorily and economically operate an internal combustion motor.* Kiefer, Drumright and Jenks shipments are not gasoline as will not do this. Blending necessary. (Rec. 738.)

---

NOTE.—The Director General will not attempt in this brief, either in the case of these witnesses, nor of other expert witnesses for the defendant, or for the Government, to abstract their testimony as to whether the "weathered" casinghead gasoline shipped from Jenks, or the blended casinghead gasoline shipped from Drumright and Kiefer, could be used to operate an automobile. The testimony of the witnesses was in hopeless conflict, both as to theory, and as to the result of certain actual tests made during the trial. It is to be observed, however, that the defendant's witnesses who denied that it could be so used, did not attempt in the tests, to readjust the carburetors, or to say that they could not be readjusted. In any event, the testimony of neither the defendant's nor the Government's witnesses, is abstracted, because the Government considers it in no way decisive of the question as to whether or not the casinghead gasoline shipped from Keifer, Drumright and Jenks, to Port Arthur, was gasoline, *within the meaning of the tariffs.*

Says at Cosden and other refineries he has observed only three to five per cent of casinghead gasoline is used in final blending.

The word "naphtha" is used in the refining business generally as the generic term of that fraction obtained by the *distillation* of the crude oil before the product kerosene is reached. It is also used more specifically to cover the heavier blending materials which are used in connection with the compression plants in some parts of the country. It is also extended by the individual manufacturer even farther than that. The Tide Water Oil Company, for instance, applies the name "naphtha" from the beginning of the process to the finished product itself which others call gasoline. (Rec. 740.) Blending is a process of refining.

Jenks, Kiefer, and Drumright shipments properly designated by name "unrefined naphtha," but "*unfinished naphtha*," or *unfinished gasoline blend*, or *unfinished casinghead*, or *unrefined casinghead blend* would be more descriptive.

"Unrefined naphtha" will embrace any naphtha product which is not being completely refined ready for use. There is a great deal of confusion and misuse of names within refineries, of products. Each Superintendent of refineries, and a good many employees, have a great many ideas about nomenclature. (Rec. 741.) As used, termed gasoline in a more or less limited sense in testimony.

Q. Take, for example, a quart of gasoline which is produced by a still-run process?

Its color, normal, when it is properly prepared, its gravity and all of the other characteristics meeting with the specifications in the refinery but do not meet the specifications of the sale, is it gasoline when it is produced from the refinery or is it only gasoline when it comes up to these particular specifications?

A. It is my practice in the refinery to call such products naphtha, although finished—although unrefined or unfinished until they meet gasoline specifications, until so blended and so put through the process to meet the specifications involved in the sale of the gasoline in question.

Q. Suppose they did not exactly meet all of the specifications, wouldn't they inherently be gasolined just the same?

A. They would inherently be substantially the same product, but I would not call it gasoline in the ordinary practice; in my experience with the Pierce oil plant, we called everything naphtha with the various qualities until it reached the stage when we applied, when it reached the finished stage and ready for shipment. The company's trade name for output number 2 was pennant gasoline, I don't claim the mere calling of it naphtha would—at one time and gasoline at another time inherently change the characteristic of the product. (Rec. 744.)

*Admits never heard casinghead gasoline called "unrefined naphtha."* More usually referred to as compression blend or casinghead naphtha blend. In a generic sense, "unrefined naphtha" would be more

proper than "unrefined gasoline," but neither of the two terms in witness's opinion are quite descriptive enough for general refinery usage. (Rec. 745.)

*"Unrefined naphtha" is not a term generally applied to casinghead gasoline.* (Rec. 746.)

BACON, one of the authors of Bacon & Hamor (Rec. 748 to 772):

Material now called gasoline not manufactured before automobiles came into use. (Rec. 749.)

Shipments from Kiefer, Jenks and Drumright to Port Arthur not properly called gasoline. *"My definition for gasoline would be this, gasoline is a mixture of combustible liquids, a finished product that will satisfactorily run a motor car."* (Rec. 750.)

Inclined to believe that if anything will come along to-morrow that will properly run an automobile, and it was derived in a large part from petroleum, that that material would properly be called gasoline \* \* \*

The situation is so desperate at the present time in regard to supplying the demands of automobile users, that every refining company is reaching out for material which can possibly go into gasoline, and I haven't any doubt that in the next three or four years, possibly sooner, new material will come in, and if those materials go in with petroleum distillatex, I believe that that product is correctly called gasoline. (Rec. 750, 751.)

Doesn't believe that terms, gasoline, kerosene, lubricating oils, which includes the three principal products of petroleum, have ever been correctly applied, except to the finished product.

Regards name "unrefined naphtha" as a proper designation for this material. Not the most descriptive designation, but a proper one. Comprehends more than merely casinghead gasoline. Includes any naphtha that has not been brought to a finished state. Blending is part of refining. (Rec. 764.) Enables refinery by blending to use wider cut of other petroleums.

Q. You have a material which you call casinghead gasoline. It is somewhat too volatile, to lower the volatility you add naphtha to it, or some other petroleum product, and you get what you admit would be gasoline; is that correct?

A. I admit that it is not gasoline.

Q. But you mean the final blended product is not gasoline?

A. *If it is blended in such a way as to meet the specifications or leaving the specifications out of consideration, if it is blended in such a way that it will run a motor car, I call it gasoline; if not I don't call it gasoline.*

Q. If I understand you correctly, what is universally known as casinghead gasoline, you call unrefined naphtha, is that correct?

A. That is correct. I don't mean it is universally known as casinghead gasoline.

Q. Do you show that in your book?

A. I have no doubt that it is called casinghead gasoline.

Q. Didn't you just call it gasoline?

A. I think probably because I have always assumed the word casinghead gasoline is really a compound word, because I have always known

that casinghead gasoline was a different type of material from what we commonly call gasoline; perhaps I can illustrate what I have in mind better by giving an illustration \* \* \*

Q. When this product which you in your book call gasoline is somewhat too volatile to denominate as gasoline it can be properly called unrefined naphtha, is that correct?

A. Yes, sir.

Q. And you then add a little more of the same material to get it back to gasoline?

A. I did not say add a little more, but add the proper amount of the same material and other materials, and then you can bring it to gasoline.

Q. Now, as a matter of fact, is casinghead gasoline unrefined in any respect, or is it not refined below the surface of the earth by a natural process?

A. I consider it unrefined because I consider any product that comes out of the ground unrefined. \* \* \*

Q. You have a false assumption, because the gasoline does not come out, but the gas. \* \* \*

Q. Now after this gasoline is liquefied and compressed into gasoline, is it not a fact that the liquid is a clear white color—is it not a fact that it has all the appearances of a high state of refined gasoline?

A. The product that comes out of the ground and as made by manufacture, as a general rule, is of a good color; that is, a color that approaches a water-white color, but I don't consider that has anything to do with

whether it is refined or not. I call the substance refined when it is up to the standard; it is not refined. \* \* \*

Q. I will ask you if it is not a fact a great many things may be in a high state of refinement and yet not be such as to be marketable?

A. Yes. (Rec. 769, 770.)

Can't, offhand, name a technical word that designates casinghead gasoline as "unrefined naphtha." (Rec. 772.)

**TESTIMONY OF EXPERT WITNESSES FOR GOVERNMENT**

HAIGH (Rec. 394-408), Superintendent Ajax Casinghead gasoline plant, located at Jenks, says casinghead gasoline is gasoline (Rec. 395) and that blend of two-thirds casinghead gasoline and one-third naphtha is gasoline.

Designates blend when vapor pressure is less than 10 pounds as gasoline. (Rec. 401.)

Calls unblended casinghead "raw gasoline," and after blending with naphtha calls it gasoline. (Rec. 402.)

LEAGUE, Inspector of Bureau of Explosives (Rec. 408-455), after testifying had inspected all casinghead gasoline plants in the country, and after naming numerous ones that called product "gasoline" and described it as such for shipping, defendant's counsel admitted (Rec. 427) that witness would testify to same effect as to all plants inspected by him.

Witness says liquified petroleum gas, even above 10 pounds pressure, called "gasoline" around the plants.

Q. (By Mr. SWACKER.) Now, referring to it in the vicinity of these plants, I understood you to say a few moments ago that notwithstanding the description required by these rules of liquified petroleum gas when the vapor tension exceeded 10 pounds that no distinction was made by the producer but they called it gasoline.

A. Yes, sir.

Q. Now, then, that name liquified petroleum gas is a very proper name of the commodity.

A. I should think so.

Q. And might with entire accuracy be applied to the commodity even though the vapor tension did not exceed ten pounds. Is that true?

A. *Aside from the shipping.* (Rec. 445-446.)

Has heard blended commodity called by various names according to blending material as such, "blended gasoline," "kerosene blended," "gas oil blended." (Rec. 446.)

Q. Now you state shipped by the Gypsy was practically of the same character as that shipped by the other people from whom you got your general information that it was called gasoline. And you say practically—when you say practically all the same, you embrace within that all this wide variety of blends; is that true?

A. *Of the naphtha blends.* Yes. (Rec. 447.)

Only people he has ever heard call blend of casing-head gasoline and naphtha "unrefined naphtha" are the Gypsy Oil Company and its employees. (Rec. 448.)

Witness says has never seen blended casinghead gasoline shipped to any other refinery than defendants as "unrefined naphtha." (Rec. 451.)

In speaking of "raw casinghead gasoline" meant unblended—did not mean to intimate that it was in a crude or unrefined state. (Rec. 451.)

SCOTT, Inspector of Bureau of Explosives. (Rec. 455-461.)

Has inspected all casinghead gasoline plants in the State of Oklahoma. (Rec. 456.)

Designates kind of gasoline by method of production, that is, calls casinghead blend gasoline "casinghead gasoline"; calls gasoline from refinery "refinery gasoline." All other casinghead gasoline plants called blended shipments "gasoline." (Rec. 461.)

BARNHART, of the Franchot plant, says that they call blended casinghead gasoline "gasoline," and that they shipped it under that name. (Rec. 462-3.)

PRITCHARD, Superintendent Gulf Refining Company, Port Arthur, (called as witness for Government.) (Rec. 576-603.)

Admits referred to still gas as "high gravity gasoline" but refuses to admit that Kiefer casinghead gasoline was "high gravity gasoline."

Does not consider anything gasoline except what meets specifications. (Rec. 601.)

The COURT. *Well, would it be high gravity gasoline as generally termed in the refinery world?*

A. *Yes, sir.*

Q. (By Mr. SWACKER). But it isn't called gasoline. Is that correct?

A. No, not what I term——

The COURT. What you term "gasoline" is when it is finished in accordance with the specifications of the purchaser?

A. Yes, sir.

The COURT. So you don't call anything gasoline until it meets the specifications of the man that buys it for the market?

A. Yes, sir.

The COURT. Then there would be different kinds of gasoline, wouldn't there?

A. Yes, sir.

The COURT. One man would have one specification and another man another. Then how would you distinguish the different kinds of gasoline of that kind?

A. The different specifications call for at different billing points.

The COURT. What would you call it?

A. Might call it South Carolina gasoline, motor gasoline, what we used to call Bohme gasoline.

Q. So now, if this commodity that was shipped from Kiefer to Port Arthur, if it met the specifications of the customer for gasoline, then you would call that gasoline, if it did not, call for any further treatment to meet it?

A. If it did not require any further treatment to meet the specifications, it would be classified as gasoline.

Q. (By Mr. SWACKER.) Did you ever know of any of this material from Oklahoma that would meet any specifications for gasoline?

A. No; I did not.

The COURT. You mean the specifications of those that were ordering it? Is that what you mean? (Rec. 601-2.)

Defendant's counsel, Mr. Swacker, then attempted to lead witness into saying that he never knew any specifications which casinghead gasoline would meet, but witness answers "Nothing I would recommend it for."

NOTE.—Following colloquy occurred between Court and defendant's counsel, Mr. Swacker and Mr. Pritchard (Rec. 590):

The COURT. Here is a point in my mind. It says now unrefined. Now, unrefined is used in a sense that it is not a finished product. If it has been refined at all, can you say it is refined?

Mr. SWACKER. A product is unrefined only until it is refined, if there is any refining done in connection with it.

The COURT. He says the blending these two products here at Kiefer, that that is the process of refining:

Mr. SWACKER. Yes; partially.

The COURT. How can you say it is unrefined if it has gone through the process of refining?

Mr. SWACKER. We say anything is unrefined until it is refined; refining is the producing finished operation.

The COURT. Unrefined means there in the sense that it is not a finished product, and was that the intention?

 Mr. SWACKER. Absolutely. That is exactly what these letters show. That it is not finished.

Q. (Mr. PRITCHARD.) Is any of the product refined at the Port Arthur refinery a refined product until it is finished?

A. No; we don't consider it so.

The COURT. Now, you mean finished is when it is put in a state to meet the specifications of the purchaser?

A. Yes, sir.

The COURT. *And then anything might be gasoline as you term it gasoline for one purchaser and not gasoline for another purchaser, according to the specifications requested?*

A. Yes, sir.

DYKEMA, Consulting Petroleum Engineer (Rec. 822-842, 852-878).

Compression of casinghead gasoline not a refining process, but casinghead gasoline produced by compression is a refined product. (Rec. 833.)

It needs no purification but is used directly as made without any change in the majority of instances and in great bulk. It is already refined by natural process under ground and does not require any refining after it is compressed into liquid state. (Rec. 834.) Refined in earth by rock pressure, it causes practically the same process as distillation and refining of crude oil in still. Condensation of vapor from still and of casinghead gas from ground produces practically the same liquid.

Mr. SWACKER. *We are not disputing that it amounts to or is analogous to a refining process, but the question implies that that made it completely refined. We say it only makes a partial refining.* (Rec. 838.)

After compression casinghead gasoline is a refined product. (Rec. 839.) Casinghead gasoline is commonly known as gasoline in trade and in the scientific world. Never heard it called "unrefined naphtha." "Unrefined naphtha" not an appropriate name because misleading; implies it would need further refining and further purification, which is not the case. (Rec. 840.) Blending is mixing, not refining. There is no purification. It is never referred to as a refining process. (Rec. 841.)

Visited Gypsy Oil Company's plant at Kiefer in 1916. This product was casinghead gasoline, a water-white colorless liquid. It was not unrefined naphtha. (Rec. 852.)

Fact that product of Kiefer plant failed to meet certain specifications of customer of refining company does not say that product was not gasoline. Blending not refining, as it removes no impurities. (Rec. 853.)

Might be called a finishing process, from the standard of meeting certain specifications. Casinghead gasoline is blended for two purposes—one to make it less volatile for handling; the other to conserve the product. Blending is usually done at the casinghead gasoline plant and it is frequently marketed direct. (Rec. 854.)

Casinghead gasoline can be marketed without blending. (Rec. 855.)

Term "unrefined naphtha" is not used in scientific works as describing casinghead gasoline.

Visited every casinghead gasoline field in the country and never heard casinghead gasoline called "unrefined naphtha." (Rec. 856.)

Gasoline has no particular specifications. There may be a number of specifications. Judged by some specifications, casinghead gasoline might be called "unfinished gasoline." (Rec. 859.)

Statement in pamphlet prepared by witness that "gasoline produced by compression is also an undesirable fuel for gasoline engines" is true in many cases and untrue in others. A compression blend product can be made where it is perfectly satisfactory for fuel and in many cases is so made. (Rec. 863.)

Naphtha fractions, including gasoline, have for a long time been called by the generic name "naphtha," even including kerosene at times. Terms "gasoline" and "naphtha" can be used interchangeably with relation to the material with which gasoline as a finished product is made. Naphtha is a generic term and embraces all gasoline. Refining is a process of removing impurities. An already naturally pure product would be classed as a refined product.

"Q. (Mr. SWACKER.) If it is unnecessary to make a thing pure because it is pure, it would be unrefined though it would be pure.

A. You could make such a statement, make such a play of words." (Rec. 869.)

Casinghead gasoline is often called "raw casinghead." It is known and sold as gasoline. (Rec. 870.)

Very often in trade qualify the name "gasoline" by the kind or blend. A distillation test not neces-

sary to determine whether the commodity is gasoline. (Rec. 871.)

*"Unrefined Naphtha"* would mean lighter cuts of petroleum which needed further purification. This does not embrace casinghead gasoline. Might include still gas gasoline, because that could be called naphtha. (Sec. 872-3.)

Q. Now, in this distillation you claim takes place in the earth, if this is a part of the crude oil, as you claim it is, is it not a naphtha part?

A. In a broad sense I think it could be called a naphtha part, although that impression (description) is never given to any material in the earth. *Speaking of naphtha, naphtha is a refined product of naphtha distillation.* (Rec. 873.)

Where casinghead gasoline is blended with crude oil, it would need further refining. When blended with refined product, such as naphtha, it does not need further refining. *By term "unrefined naphtha" means a distillate which needs further refining, more usually called crude naphtha. Casinghead gasoline does not require further refining.* (Rec. 876.) Blending comes after the refining of the gasoline is completed. (Rec. 877.)

DEBARR, Vice President Oklahoma State University and Head Department of Chemistry (878-892).

Compression of casinghead gas produces casinghead gasoline. There are other kinds of gasoline—motor gasoline, casinghead gasoline, gas-machine gasoline, cleaners' gasoline.

Casinghead gasoline is not properly denominated "unrefined naphtha" because it is a pure refined product as it comes from the earth. The blending of casinghead gasoline with naphtha which has been given the usual three refinery processes does not produce "unrefined naphtha" because both products before put together are refined and putting two refined products together is not a process of refining. (Rec. 879.)

Could not take casinghead gasoline and blend it with refined naphtha and produce "unrefined naphtha" and then by addition of more of the same naphtha come back to gasoline. (Rec. 880.)

NOTE.—That this could be done would be the logic of the defendant's contention.

The fact that a particular gasoline is too volatile for use in an automobile does not justify calling that gasoline something else. Casinghead gasoline has practically the same chemical properties as refinery gasoline except in proportions. Even if recovery from casinghead gasoline was only 88 per cent, it would still be gasoline. Fact of failure to meet specifications of Gypsy-plant customer for gasoline would not justify calling it some other name. The quality in gasoline which makes the prompt starting of an automobile is the low-boiling constituents. (Rec. 880.) The more volatile a liquid, the easier it is to start an engine. The blending of casinghead gasoline with refined naphtha would not tend to refine the casinghead gasoline by the mere mixing of the two together. The fact that casinghead

gasoline is blended in order to lower its gravity does not justify calling casinghead gasoline "unrefined naphtha."

Does not know of any scientific work calling casinghead gasoline "unrefined naphtha," nor has he ever seen it used in trade journals. The only place he has seen the term used is in Bacon & Hamor, and then not under head of casinghead gasoline. (Rec. 881.) That book did not describe casinghead gasoline as "unrefined naphtha."

Says he has used casinghead gasoline to run a Paige seven-passenger sedan (Rec. 882). Too volatile for safe use in this manner generally. (Rec. 883.) Uses "refined in the sense of pure" and has no need of any purification for the purpose for which it is applied. (Rec. 885.)

Q. (By Mr. SWACKER.) But it is also necessary, in the manufacture of gasoline, even in the sense of pure, to do something to correct its boiling point?

A. Yes.

Q. And that is frequently done by a refinery?

A. Yes, and it is done without one. With or without one, either. (Rec. 885.)

NOTE.—Mr. Swacker's question shows that he confuses anything done at a refinery with "refining."

The lighter hydro-carbons are in larger proportion in the casinghead gasoline and the heavier constituents of hydro-carbons are in lesser amount, while the straight run gasoline might have a preponderance of the lighter or still going down, you have the

heavy constituents, but it will also have the lighter ones, and it sometimes and in some fields varies in this in the mid-continent field, just the same as casinghead gasoline.

Never heard of casinghead naphtha before witness heard it in this case.

Terms "naphtha" and "gasoline" are applied interchangeably with a great deal of confusion. (Rec. 888.) Principal difference between casinghead gasoline and refinery gasoline is in degree of preponderance of lighter against heavier hydro-carbons. Also test as to whether or not it would run a car. You can get down to a point when you would get such a preponderance of lighter hydro-carbons you could not run the car, and also where too heavy hydro-carbons it would not operate a car. (Rec. 889.)

Does not know whether Bureau of Mines or Bacon & Hamor originated term "unrefined naphtha."

NOTE.—Neither of these publications refers to casinghead gasoline under this name.

*Uses prefix in casinghead gasoline just as witness would speak of ordinary gasoline as motor gasoline, and gas machine gasoline as gas machine gasoline. Every gasoline has a special prefix. Gasoline as "commonly used" embraces casinghead gasoline.* (Rec. 890.)

Uses gasoline as a generic term. Uses plural when witness wants to speak of any particular kind of gasoline and specifies the prefix to indicate what kind of gasoline. Uses it as embracing finished or

perhaps slightly unfinished, but not unfinished for purpose for which it is to be used. (Rec. 891.)

Q. Now from your observation of the practice of refiners, I will ask you if it is not your practice to use the word refined as applicable to the products produced by the refineries?

A. Yes, sir; they do. I suspect, that is my opinion, that is what I have got from talking with them.

NOTE.—This again illustrates confusion in use of term "refined" by defendant's counsel. If defendant's counsel and refineries are correct in such use, it demonstrates among other things that the naphtha produced at defendant's refinery and shipped north-bound to Kiefer, Drumright, and Jenks was refined, though they contend it is "unrefined."

---

As was stated, the foregoing does not pretend to be a comprehensive abstract of the testimony of either the defendant's or the Government's expert witnesses. It is sufficient to show, however, that, as already suggested, the defendant's experts justified their conclusions that the indicted shipments of blended and unblended casinghead gasoline were not gasoline, by arbitrarily confining their definition of that term to such gasoline as would satisfactorily operate an automobile engine; that they acknowledged that such blended and unblended commodities were popularly known as gasoline, and that they did not attempt to say that they were not gasoline within the meaning of the tariffs; that while they further

undertook to justify the application of the description "unrefined naphtha" to such shipments, they all admitted that at least a more descriptive term would have been "unfinished naphtha"; that they all defined naphtha in the generic sense as a *distillate*, while admitting that casinghead gasoline is a *condensate*; that, so far as they justified the use of "unrefined," they did it on the ground that further blending was necessary before such shipments could satisfactorily be used to operate automobile engines, or to fill the specifications of their customers, and that they considered "blending" a process of "refining"; that the court itself pointed out to them that calling a commodity "unrefined" meant it was not refined at all, and that their own counsel admitted that these shipments were, at least, "partially refined."

Certainly on these admissions, even without reference to the testimony of the defendant's experts, the court was entitled to let the question go to the jury, as to whether the shipments were gasoline or were "unrefined naphtha," and certainly there was at least substantial, if not conclusive, evidence to support the jury's finding that the shipments were gasoline, as charged in the indictments.

**(g) LETTERS OF DEFENDANT'S TRAFFIC MANAGER ELLIS DESCRIBING SHIPMENTS FROM KIEFER, DRUMRIGHT, AND JENKS AS "GASOLINE" IN ASKING REDUCTION OF RATES THEREON**

As already noted, the record contains certain letters from the defendant's traffic manager, Ellis, to the carrier's traffic officials, and certain replies by them, in

which both Ellis and they distinguish between the *northbound* shipments of "*naphtha*" and the *southbound* shipments of "*gasoline*."

Before referring to this Ellis correspondence, all of which precedes the period of indictment, it is desired to refer to Government Exhibit No. 75 (Rec. 1293) which was a letter written during the period of the indictment, February 10, 1917, from W. P. Donovan, General Superintendent of the Gypsy Oil Company, to P. T. McKirahan, General Agent of the A., T. & S. F. Railway Company. That letter had reference to the construction of loading racks at the defendant's casinghead gasoline plant at Drumright. It must be remembered that the defendant's counsel admitted (Rec. 179) that the only thing produced at its plants was casinghead gasoline. Throughout Mr. Donovan's letter, the racks are referred to as *gasoline* loading racks, and there are repeated references to the danger of handling *gasoline*, to the Bureau of Explosives' regulations for handling *gasoline*, and to *gasoline* shippers. This latter reference is immediately after a reference to a meeting of the "Executive committee of the Casinghead Gasoline Producers Association of America" "to discuss the shipping of casinghead gasoline from all angles." Mr. Donovan writes:

I feel that nearly all the *gasoline* shippers want to work in harmony with the railroads, etc.

Ellis, on January 18, 1914, wired the General Freight Agent, Kansas City Southern Railroad:

Requested Powers Docket rate 33¢ *Kiefer to Port Arthur* on *gasoline* for coastwise shipments. (Government Exhibit 90, Rec. 1366.)

On January 19, 1914, he wired the same party:

Exchange telegram relative 33-cent rate *Kiefer to Port Arthur*. In addition to this *southbound* rate we are figuring on moving about 50 cars per month or more of *naphtha* from *Port Arthur to Kiefer*. Have talked with Powers, St. Louis, long distance. \* \* \* Use your influence with other lines. (Government Exhibit 91, Rec. 1366.)

On January 19 he wrote Powers, Assistant General Freight Agent, St. Louis & San Francisco Railroad:

Referring to my long-distance telephone conversation this morning relative to docketing subject for San Antonio Meeting to-morrow rate 33 cents per hundred pounds *naphtha* from *Port Arthur* and *West Port Arthur* to *Kiefer, Okla.* We are figuring on from 50 to 75 cars of *naphtha* from *Port Arthur to Kiefer*. \* \* \* This *naphtha* is being moved from *Port Arthur to Kiefer* to be further refined at that point in connection with products now at *Kiefer*, and the *outbound shipments* will consist of *gasoline*, and for each car of *naphtha* moved into *Kiefer* there is approximately *two cars of gasoline* outbound. (Government Exhibit 92, Rec. 1367.)

On January 19, 1915, Christian, of the Sunset Central Lines, and Riley, of the Frisco Lines, wrote a joint letter to Ellis, reading in part as follows:

Referring to conversation yesterday morning concerning your application for rate of 15 cents on *naphtha from Port Arthur to Kiefer* as a traffic proposition.

You are advised that in view of this *commodity having passed beyond the crude state, it necessitated giving consideration to a reduction in the refined product.*

\* \* \* It has occurred to us that possibly you would not insist upon the *northbound* rates being disturbed for so small a distance, which we feel can have but one result, namely, the corresponding differences *southbound*. (Government Exhibit 93, Rec. 1368.)

NOTE.—(Apparently the three letters preceding the above should have been dated 1915 instead of 1914.)

On February 9, 1915, Ellis wrote Christian and Riley jointly:

\* \* \* "We have gone into this matter from all angles and am going to ask that you arrange for the publication of rate 40 cents from Port Arthur to Kiefer and 30 cents from Kiefer to Port Arthur. \* \* \* applying on *naphtha and gasoline.*" (Government Exhibit 88, Rec. 1365.)

On March 18, 1915, the Assistant Freight Traffic Manager of one of the lines wrote Ellis:

Referring to your joint letter of February 9, File 17-A, regarding publication of rate of 30 cents on *naphtha from Port Arthur, Tex., to*

*Kiefer, Okla.*, also the same rate in the reverse direction on gasoline. \* \* \* Your application has been given careful consideration and this is to advise that in view of the present conditions, that particular traffic not yielding sufficient revenue to pay the cost of operation, and the further fact that we are now endeavoring to increase rather than reduce rates, it will be impracticable to establish the rates at this time which you propose. (Government Exhibit 89, Rec. 1365, 1366.)

A copy of this letter was sent to Christian of the Sunset Central Lines.

On May 16, 1916, Ellis wrote Riley of the Frisco, with copies to Christian, Mitchell, and others:

All of our products from Port Arthur and North Port Arthur is an unfinished product and is passed through the refinery at Kiefer, and the products secured from this partial refining at Kiefer is an unrefined product and is transported to our Port Arthur refinery, and at that point further refined, and we are entitled to the unrefined rate as above. (Government Exhibit No. 97, Rec. 1376.)

On the same date Ellis wired Riley in part:

Will you please arrange through South Western Committee for publication 30-cent rate crude unfinished naphtha, Port Arthur and West Port Arthur to Kiefer and Kiefer to Port Arthur and West Port Arthur, etc. (Government Exhibit 98, Rec. 1377.)

On May 29, 1916, Powers of the Frisco wrote Mr. Ellis under the heading "*Gasoline—Rates on from Points in Oklahoma, Beaumont-Port Arthur District*":

Someone has suggested the cancellation of Item 2546-B, Supplement 40, SWL Tariff 26-T, offering as an excuse that the continuation of this figure may jeopardize rates of 27 and 29 cents, respectively, to this common point territory.

We shall be governed by your requirements in the premises as to the cancellation of Item 2546, and shall thank you to advise fully by return mail. (Government Exhibit 86, Rec. 1364.)

On June 5, 1916, Ellis wrote Powers in part:

We do not want this rate canceled as it is in daily use. We are now moving about 18 cars per week on this rate. (Government Exhibit 87, Rec. 1364.)

These letters clearly show that Ellis, having been refused a reduction by the carriers on the refined product when he correctly described his *southbound* shipments from Kiefer and Drumright as *gasoline*, and his *northbound* shipments as *naphtha*, conceived the idea of getting the reduction by confusing the character of the *northbound* shipments of *naphtha* with the *southbound* shipments of *gasoline*, under a common name of "crude unfinished naphtha," though both commodities were actually refined.

Moreover, a reference to the testimony of Powers (Rec. 533 to 539, 559 to 567) then Assistant General Freight Agent of the Frisco, and of Reilly (Rec. 567 to 576) will substantiate this.

Powers says (Rec. 563) that Ellis explained that he had a quantity of *low grade naphtha* at Port

*Arthur*, which it was desired to move to Kiefer, providing rates would be established that would warrant moving it up there, and working it through the Kiefer plant, and then moving it back to Port Arthur and then reworking it again and putting it on the market. *He said he was going to ship naphtha under the rate.* That it was a low-grade article to be shipped and treated and reshipped to Port Arthur to be further finished. (Rec. 565.)

Reilly says (Rec. 571) that in publishing a rate on crude naphtha, or unrefined naphtha, or unfinished naphtha, they put it in on the regular basis.

The COURT. Without any investigation of what it was?

A. Well, your Honor, that is impossible. We can not go out into the field. We don't know what is being shipped; we are hundreds of miles removed from the shipping point. (Rec. 571.)

He later says (Re. 57c4) that they had in mind the tariff rate that had been published in accordance with the Commission's decision in *National Refining Company v. M., K. & T. Ry.*, 23 I. C. C., page 527, involving rates from Oklahoma and Kansas to Baton Rouge.

A reference to the Commission's decision, however (Rec. 1378), will show that the commodity before the Commission was *a distillate from crude oil, and not a condensate from casing-head gas*, but that even so the Commission held *the gasoline rates legally applicable*, but merely unreasonable to the extent they exceeded

by two cents per hundred pounds the rates contemporaneously applicable on crude oil.

Yet it is of this decision that the Court of Appeals, in its opinion, declares (Rec. 1690):

In the light of the ruling of the Interstate Commerce Commission in the National Refining Company case, the rate on unrefined naphtha theretofore given by one of the carriers to Baton Rouge on a commodity *shown to be substantially the same as a condensate* of the Gypsy Company's plants, and the testimony in this case we think the insistence (that the conduct of the defendant was fraudulent) groundless, and must have been highly prejudicial.

In the light of Ellis's letters, and of his independent representations to the carriers, the Government is forced to repeat the charge that the conduct of the defendant was fraudulent in obtaining the publication of a rate on an anomalous commodity such as "unrefined naphtha," and in applying such a rate to casing-head gasoline, blended or unblended, without disclosing to the carriers the true nature of the commodity which was being shipped.

## II

### **None of the Alleged Errors Pointed Out by Circuit Court of Appeals Constitutes Reversible Error**

Reference has already been made under I (c) to the alleged error in the admission of evidence that both prior and subsequent to December 2, 1916, all other shippers shipped and described similar ship-

ments as gasoline, between these same points, and between other points as well. It should be again noted, however, that Mr. Swacker's admission (Rec. 427) in this respect, was a broad admission that League would so testify, and his subsequent misleading questions to League do not render this admission incompetent, but at most, go to its weight.

The alleged error in permitting evidence of erasures of the word "gasoline" from defendant's book records of shipments embraced by the indictment, it has been shown I (d), is due to some inexplicable ignoring upon the part of the Circuit Court of Appeals, of the defendant's admission that such erasures had been made by an employee of the defendant subsequent to an inspection of the books by an examiner of the Interstate Commerce Commission.

Likewise, it is shown under I (e) that there is not the slightest ground for the apparent conclusion of the Circuit Court of Appeals that evidence was inadmissible of the mutilation of the defendant's records by cutting off headings describing shipments embraced by the indictments as "gasoline."

It only remains to refer to the alleged error in the remarks of counsel for the defendant to the jury.

One of Government counsel made the following statement in his argument to the jury:

Mr. Tabor, the vice president of the company, quoted a list of works of about 150 perhaps, all told, on the subject of naphtha, but when it came to the subject of how many of those dealt with unrefined naphtha he was

crowded back to the conclusion that there was but one man and that he had been quoted by another, and one of those men was the employee, or rather came from the Mellon Institute in Pittsburgh. Now, what is this Mellon Institute? It is an institution that was founded by the Mellon family, of Pittsburgh. Mr. W. L. Mellon is president of the Gulf Oil Corporation. (Rec. 905.)

Counsel for defendant interposed objection to these remarks, and the trial court promptly admonished the jury not to consider them. The following is quoted from the record:

By Mr. DIGGS. If the court please, we except to that as no evidence in the record showing Mr. Mellon's connection with this company, W. L. Mellon, as president, the evidence being that the sworn evidence of George S. Davis was president.

By the COURT. Yes.

By Mr. GANN. He was president of the Gulf Oil Corporation.

By Mr. DIGGS. No evidence connecting him with this case at all.

By the COURT. Yes; there is not any evidence here, and the jury will not consider it. (Rec. 905-6.)

As to the other remarks of Government counsel which were assigned as error: No objection was interposed to these remarks at the time. (See pp. 906-908 of the record, in which the statements of Government counsel are quoted and showing that defendant made no objection at the time.) The record

shows that those statements were made on April 22, 1920. (Rec. 899.) On the morning of April 23, as one of Government counsel was about to resume his argument to the jury, the court interposed and made the following statement to the jury:

By the COURT. Wait a minute. Now, gentlemen of the jury, the defendant makes the following exception: The defendant excepts to the comment of the Government's counsel Gann and Chambers suggesting that the United States Government is pecuniarily affected by the matter under consideration, the defendant not being on trial on a charge of defrauding the United States, and also except to the comment of Government counsel Chambers upon the wealth of the defendant, such comment to the jury being highly improper and calculated to inflame, and defendant moves the court to instruct the jury to especially disregard such remarks. And defendant also excepts to the statement of Mr. Chambers to the jury charging the defendant had violated the safe transportation rules, such charge being contrary to the fact and admission of the Government and calculated to inflame; and defendant moves the court to especially instruct the jury regarding it. *Now, yesterday both sides on these points, to my mind, went outside the proper domain; as there was no objection, I permitted them to do that.* One side charged in the argument that the railroads, a part of the time when the country was at war, were under Federal control. Then the statement was made about what the result would be affecting members of the jury.

That has nothing to do with this case. Then the other side said how it affected their clients, how they could be made to refund in civil damages. So I admonish you to try the case according to the evidence. Hear the arguments of the attorneys, and when they are sound, if they are sound, that is for you to determine. If they do not confine themselves to the evidence in the case, that is for you to determine. The case is to be tried without fear or favor, without any regard as to how it affects people, but solely with a view of the weight of evidence as to be determined by the jury and as to the law to be given you. *The exception was made on the reconvening of court and after the argument had been made the previous day, but before the arguments were finally concluded.* (Italics ours; some slight changes have been made in the phraseology of the above statement as reported on pages 908 and 909 of the record to correct what are obviously stenographic errors.)

Special attention is called to the statement of the court that *both sides* went outside of the proper domain of argument. The Government counsel were not the only ones that offended in this regard. But the fact that the trial court especially admonished the jury concerning the remarks of counsel and instructed the jury to disregard such remarks cured any error that was made in this regard. And this seems to be especially true in this case, because the court admonished the jury a second time to disregard improper arguments. Just before the trial judge

made his general charge to the jury he admonished the jury as follows:

By the COURT. Gentlemen of the jury, before I begin the charge I will read to you what I said this morning. Now, on yesterday both sides on these points, to my mind, traveled outside of the domain of proper argument. I permitted them to do this, no objection being made by either side at the time. One side suggested in the argument that the railroads a part of the time were under Federal control, being in the hands of the Director General; in another statement that was made, that the result of the verdict might affect the interests of the taxpayers, including the interests of the jurors, or in substance that. That on the part of the defendant it was adverted to the fact that the defendant could be made to refund in a civil suit. The jury are admonished that the case is to be tried according to the evidence and the admissions. The jury are to hear the arguments of the attorneys and when they consider the arguments sound as relating to proved facts from the evidence admitted in the case and the admissions in open court before the jury, that is for them to determine. If the attorneys do not confine themselves to the evidence and admitted facts in the case, the jury should disregard such argument. The case is to be tried without fear or favor and without prejudice, and without any regard to the pecuniary effect upon anyone, but solely with a view of justice. As regards the safety

appliances, it is my understanding there is no contention of any violation of the same by the defendant in observing regulations prescribed as precautions to safety. That is for the purpose of reading that in the record and is an admonition to the jury. (Rec. 911.)

If any of the improper remarks made on either side tended to prejudice the jury, this double admonition by the court to the jury to disregard such remarks clearly would offset any such prejudice. It is well established that error of counsel made during the course of a long argument to the jury and after a long trial is not an incurable one, and if the error is objected to and the court instructs the jury to disregard such statements, the error is cured.

*United States v. Snyder*, 14 Fed. 544, 557.

*Carroll v. United States*, 154 Fed. 425, 430 (C. C. A. 9th Cir.).

*Ammerman v. United States*, 185 Fed. 1 (C. C. A. 8th Cir.).

### III

To permit either the Circuit Court of Appeals or the trial court on a new trial to disregard the positive requirements of the carrier's published tariffs and of the Commission's regulations for the transportation of dangerous articles, both of which require the description of these articles as gasoline, would be to vitiate the powers conferred upon the Interstate Commerce Commission under sections 1, 6, 13, and 15 of the Interstate Commerce Act, and to nullify the powers of the Government under the so-called Transportation of Explosives Act, Criminal Code, sections 233 to 236

The binding legal effect of the tariff provisions of the Western Classification requiring that—

Condensates of casinghead gas when reduced to a maximum vapor pressure of ten pounds per square inch and shipped either alone or blended with other petroleum products, be shipped and described as gasoline, casinghead gasoline, or casinghead naphtha,

has already been commented upon under I (a) of this brief.

The compelling evidentiary effect of such tariff provisions aside from their conclusive legal effect, was also there commented upon.

It will now be shown that to permit the Circuit Court of Appeals, or the trial court on new trial, to ignore these mandatory requirements not only of published tariffs, but of the Commission's Regulations for the Transportation of Dangerous Articles, would be to nullify both the Commission's powers under the Interstate Commerce Act, and the Government's powers under the Transportation of Explosives Act.

It should be understood that this is the inevitable effect of a failure to correct the opinion of the Circuit Court of Appeals herein, even though in this case the Government admitted that the Commission's Regulations for the Transportation of Dangerous Articles had been complied with, so far as the placarding of the cars embraced by the indictment was concerned. (Rec. 225, 226, 230.) Indeed evidence of a violation of the provisions of the Criminal Code for the Safe

Transportation of Explosives and Other Dangerous Articles, could not properly have been admitted under these indictments charging only violations of the criminal provisions of the Elkins Act.

What it is desired here to point out is that the logical and inevitable effect, however, of allowing the Circuit Court of Appeals, or any other court, to ignore the Commission's administrative regulations requiring the description of these shipments *for shipping purposes* as gasoline, casinghead gasoline, or casinghead naphtha, would be to put it in the power of a court, were the defendants indicted for violation of the Commission's Regulations for the Transportation of Dangerous Articles, to nullify collaterally the Commission's administrative regulations by undertaking to decide that, as matter of fact, the commodities were not gasoline. This the court might do because the court might believe, as here, on the testimony of expert witnesses, that the commodities did not come within the specifications of gasoline for some particular purpose, such as the operation of an automobile engine, or because, on like testimony, the court might differ with the Commission as to the proper chemical designation of such commodities, as distinguished from their designation for tariff and transportation purposes.

That administrative regulations made by Government departments under authority granted by Congress have the force of law, and that violation of them may subject the violator to criminal prosecution, is established by the case of *United States v.*

*Grimaud*, 220 U. S. 506. That Congress may legally delegate the power to make such administrative regulations to the Interstate Commerce Commission was decided in the case of *Interstate Commerce Commission v. Goodrich Transit Company*, 224 U. S. 194. That the Commission's administrative orders can not be set aside by the courts unless the Commission has exceeded the powers conferred upon it, or has acted arbitrarily in the absence of any evidence, has been repeatedly held by this court. See *Interstate Commerce Commission v. Union Pacific Railroad Co.*, 222 U. S. 541.

It must likewise be clear that the administrative powers of the Interstate Commerce Commission under Sections 1, 6, 13, and 15 of the Act to Regulate Commerce to prescribe just and reasonable rates and classifications and just and reasonable regulations and practices affecting the manner in which property tendered for transportation shall be marked and described, could be similarly nullified were the court to determine collaterally that, even though the Commission should prescribe the description of such commodities as those here shipped as gasoline, and so classify them for rate-making purposes, that such commodities were not in fact gasoline, in the opinion of the court. The situation in this respect is in no wise changed merely because the provisions of the Western Classification were, as tariff provisions, published by the carriers rather than prescribed by the Commission. As tariff provisions, as already shown under I (a), they were binding upon

the shippers, carriers, court, and Commission alike. Moreover, in this instance they had, in effect, been prescribed by the Commission, it obviously being impracticable to prescribe one description for such shipments under the Commission's Regulations for Transportation of Dangerous Articles, and another description for such shipments under the defendant's tariffs.

Indeed, this very situation illustrates the inherent harmfulness of the device used by the defendant to obtain a lower rate on its shipments of gasoline, than the rates published in the carrier's tariffs, by inducing the publication of a rate on "unrefined naphtha," and by describing its gasoline shipments as such. It is perfectly apparent that reduced rates were finally solicited on "unfinished" or "unrefined" naphtha, and published by the carriers, because the carriers did not wish to endanger the level of their gasoline rates generally, or to give all gasoline shippers the benefit of the reduction. The result is, as shown here, that the defendant by the simple device of obtaining the publication of lower rates on an anomalous commodity described as "unrefined naphtha," and by changing the description of its gasoline shipments to conform to this designation, obtained the sole benefit of the reduced rates, since all other shippers, as this record shows, continued to describe their similar shipments as gasoline, and to pay the higher charges legally applicable to that commodity.

## CONCLUSION

In conclusion, therefore, the Government submits that the judgment of the Circuit Court of Appeals should be reversed on the following grounds:

First, that that judgment is unlawful as a collateral attack on, and interference with, the lawful administrative rulings of the Interstate Commerce Commission.

Second, that the judgment ignores the mandatory and binding requirements of the carrier's published tariffs.

Third, that the alleged errors in the District Court upon which that judgment is based did not constitute reversible errors.

Fourth, because the conclusion of the Circuit Court of Appeals that the verdict of the jury was without support in the evidence was based upon an arbitrary disregard by the Circuit Court of Appeals of competent and legal evidence which warranted the jury's verdict; and

Fifth, because, since there was substantial evidence to support the jury's verdict found under appropriate instructions, the Circuit Court of Appeals was without jurisdiction to set that verdict aside merely because it might differ with the jury as to the conclusions to be drawn from that evidence.

Respectfully submitted.

**BRIEF FOR RESPONDENT IN OPPOSITION TO PETITION  
FOR WRIT OF CERTIORARI.**

The respondent, Gulf Refining Company, respectfully submits the following opposition to the petition for writ of certiorari filed by United States of America, petitioner:

**I.**

This Court is without jurisdiction to grant the writ prayed for, because the case is a criminal case in which the judgment of the Circuit Court of Appeals is in favor of the defendant.

It is settled by this Court that in such case the writ of certiorari will not issue.

*United States v. Dickinson*, 213 U. S. 92.

*United States v. Evans*, 213 U. S. 297.

## II.

The indictment in this case charges the Gulf Refining Company with having received concessions and discriminations in rates on the shipment of gasoline from Oklahoma points to Texas in violation of Section 1 of the Elkins Act.

✓ No violation of any other provision of law was charged, and no reference was made in the indictment to the Transportation of Explosives Act or any other criminal provision except the one mentioned.

The evidence showed without contradiction that the defendant paid the rate regularly established by the railroad companies and filed with the Interstate Commerce Commission expressly to cover the movement of the traffic in question (*Record*, pp. 559-566, 567-574) under the name "unrefined naptha", which description originated with the carriers several years previously in deference to an order of the Commission directing them to establish a proper designation for a similar material then without other description, in a case with which respondent had nothing to do (*Record*, pp. 567-574, 694; *Ex. 99*; *Record*, pp. 1378-1383). It also shows that the representatives of the Bureau of Explosives knew of these shipments and of the name that was being used (*Record*, pp. 179-182, 408-416, 429-440).

All of the evidence showed that the product shipped as "unrefined naphtha" was naphtha, and that it was being shipped to Port Arthur not to be put upon the market as "gasoline" until blended or further processed. If the product was naphtha and had to be sent to the refinery to be prepared for market, it was of course properly called in the tariff "unrefined naphtha". The evidence (as held by the Circuit Court of Appeals) was that the product shipped was not proper for use as commercial "gasoline" and should not be so called. Indeed, it would be a criminal offense under the laws of Texas to ship or sell it as gasoline. It was even admitted by the Government's own expert witness that the material is properly embraced within the generic name "naphtha", and that it was in an unfinished state requiring correction of its boiling points before it would become the material known and sold as "gasoline" (*Record, pp. 883-892*).

A verdict for defendant should have been directed, as held by the Circuit Court of Appeals: that the general verdict against the defendant was induced by manifest errors of the trial is so clear that the application for writ of certiorari does not refer to any one of the issues tried in the District Court or argued in the Circuit Court of Appeals.

The statement on page 4 of the petition for the writ, to the effect that the rates on unrefined naphtha being open to respondent's competitors, if properly applicable, were nevertheless not used by the competitor, is misleading; because it fails to add that when respondent's competitor learned of the existence of the rate it filed suit to recover the overcharge exacted of it, evidence of which was of-

ferred by respondent on the trial, but excluded, and was assigned, argued and found as error by the Circuit Court of Appeals (284 Fed. Rep. 90, 102).

The next statement in the petition (page 4), that respondent's subsidiary continued to use the description "gasoline" in shipping to other points, is misleading; because it fails to state that there were no "unrefined naptha" rates available to such other points; thus rendering such evidence irrelevant, and its admission was assigned and argued as error, and so found by the Circuit Court of Appeals (284 Fed. Rep. 90, 102).

The application for the writ is based almost entirely on what is called the "remarkable" conduct of the Circuit Court of Appeals in not discussing defendant's assumed violation of a law for which it was not indicted. If the court had given consideration to a matter so entirely foreign to the case, it would perhaps have been content to refer to the Government's appendix to its brief in the Circuit Court of Appeals, wherein it is stated (p. 6):

"(The Government admits that the cars shipped from Jenks and Kiefer were properly placarded to comply with the regulations.)" with reference to explosives. "(Also that the bills of lading bore a stamp stating that the dome placards had been applied *throughout the period of time covered*). (The Government admits that the dome placards are necessary only when the tank cars contain any admixture of casinghead gasoline with other petroleum products, or casinghead gasoline alone; and also admits that they were not used contrary to the regulations; and that the dome

cover placards are required only on casinghead gasoline or an admixture containing casinghead gasoline)" (*Record*, p. 229, 230).

Further, if the Court had given consideration to the matter, doubtless it would have abstained from doing that which the representatives of the Government have done in this application. It would not have gone entirely out of the record and appealed to the records of the Bureau of Safe Transportation to prove that the product which the law permits the defendant to transport, and which the Government admits was transported according to law, is more destructive than dynamite; and to secure the details of accidents in Tennessee and Oklahoma with which defendant was not connected, and of another in Texas placarded in accordance with the requirements of the Interstate Commerce Commission.

Nor would the Circuit Court of Appeals have failed in its duty to properly apply the law of this case even if the effect had been to "nullify" the law as to explosives, which the Government in its brief admits was neither nullified nor violated.

The obvious purpose of the statements contained on pages 4 and 5 of the petition for the writ, concerning these accidents, is to convey to this Court the impression that respondent's course was responsible for or had a tendency to cause the accidents cited. Nothing could be further from the truth. As above pointed out, the Government admitted, and respondent also independently proved, that the safety regulations, as such, were strictly complied with by respondent. On the other

hand, the accidents mentioned at Memphis and Ardmore, in which a number of people were killed, were not with respect to shipments of respondent's, but, on the contrary, were with respect to shipments of others, *described as the Government claims they ought to have been*. And as to the accident at Gainesville, Texas, which was respondent's, the evidence taken in a joint investigation by the county authorities and the Bureau of Explosives showed conclusively that the man who caused the accident was not only not misled by the billing, but, on the contrary, had never even seen the way-bill, and, furthermore, that he caused the accident by intentional disobedience of the instructions on the car prescribed by the Bureau of Safe Transportation.

As above stated, none of this matter is any part of the record in the case, but the allusion to it by the Government, with the inferences sought to be conveyed, is characteristic of the tactics by which its representatives succeeded in obtaining a conviction in the District Court.

The Government thinks further that it was remarkable that the Circuit Court of Appeals "does not mention" Rule 44 of the Western Classification, "though such tariff provisions appear in full in the record." If the Circuit Court of Appeals had "even mentioned" all the improper evidence that was admitted upon the trial, the opinion would have been very tiresomely long, without being in any way improved.

During the time in question there was a divergence between the description to be used for safe transportation purposes, as prescribed by such regulations which are published in the Western Classification, and the de-

scription for rate purposes published in the commodity tariff applicable to the shipments.

In this case the Government is now attempting to claim, because the description required for *safety purposes* takes a higher rate than that prescribed for *rate purposes*, that it, the safety description, determines the rate legally applicable. It would be the first to claim the opposite if the situation was reversed.

The statement of the application that there was evidence

“showing that the respondent had obtained the publication of these rates on unrefined naphtha by misrepresentation and by concealing the fact that it was intended to ship these condensates under that description, contrary both to the Commission’s regulations and to the carriers tariffs”,

is a gross perversion of the record, which shows that the rate was secured with full knowledge that it was to be applied to the product of the casinghead plants intended to be shipped for further refining (*Record*, pp. 559-576, 692, 693); and that with the knowledge of the railroads and the employees of the Government it was so shipped for more than two years (*Record*, pp. 179-182, 408-416, 429-440, 550-557).

The statement made in argument on page 6 of the petition, that gasoline rates have been expressly held reasonable as applied to such condensates, in the case of *Southern Carbon Co. v. A. & L. M. Ry. Co.*, 62 I. C. C. 733, and the statement on page 8 that their “designation as gasoline” had been prescribed in that case by the Interstate Commerce Commission for rating, are directly contrary to the fact.

As will be seen by reference to that case (62 I. C. C. 734, 735), the product there in issue was an absorption-process gasoline, and the question was whether it should be described as "gasoline" or "liquefied petroleum gas". There were no "unrefined naptha" rates in issue, and the propriety of such a description was not even considered. There is nothing whatever in that case to indicate the degree of blend involved which would be absolutely controlling as to whether that material could ever be appropriately called "unrefined naptha".

The statement contained on page 8 of the petition, to the effect that it was admitted by respondent's expert that the condensates in issue were popularly known as gasoline, is also quite misleading. For this same expert (*Record*, p. 694) coupled that statement with the further statement that it was not a correct description, and that in a bulletin issued by the Bureau of Mines, of which he was the author, written more than two years before the incidents in issue, which was offered in evidence, he there stated that the name "gasoline" was very loosely applied and that this material was not in fact gasoline (*Record*, p. 694).

It is not conceived that this Court can be influenced by the Government's suggestion that unless this unwarranted criminal action against defendant is sustained the Government may lose in a civil action to which it is a party.

The suggestion is that the Government should be allowed to do a wrong in this case in order to help it to a further wrong in another case.

The application adds to the record, perverts the facts, makes untenable propositions of law, and asks the Court to take action based upon unworthy and immoral considerations, and should be denied.

April 26, 1923.

IN THE  
SUPREME COURT OF THE UNITED STATES.

No. 40,

OCTOBER TERM, 1924.

(29544)

---

UNITED STATES OF AMERICA,

*Petitioner,*

*vs.*

GULF REFINING COMPANY,

*Respondent.*

---

**MOTIONS TO DISMISS AND TO AFFIRM.**

Now comes Gulf Refining Company, the respondent herein, by R. L. Batts, James B. Diggs and Frank M. Swacker, its attorneys, and moves this Court to dismiss and quash its writ of certiorari herein for want of jurisdiction or because the same was improvidently issued, for the reasons stated in the annexed argument; and the said respondent also moves this Court to affirm the judgment of the Circuit Court of Appeals, for the Eighth Circuit, in said cause, upon the ground that it is manifest that the questions on which the decision of the cause depends are so frivolous as not to need further argument.

R. L. BATTS,  
JAMES B. DIGGS,  
FRANK M. SWACKER,  
*Attorneys for Respondent.*

PLEASE TAKE NOTICE, that, upon all the papers and proceedings herein, we shall submit to the Supreme Court of the United States, at a stated term thereof, on Monday, <sup>November 17</sup> ~~October 14~~, 1924, at the Capitol in the City of Washington, D. C., at the opening of court on that day or as soon thereafter as counsel can be heard, the motions of which the foregoing are copies; and that we shall submit with said motions, and in support of the same, the arguments annexed hereto.

Yours, etc.,

R. L. BATTS,  
JAMES B. DIGGS,  
FRANK M. SWACKER,  
*Attorneys for Respondent.*

To

HON. JAMES M. BECK,  
*Solicitor General of the United States,*  
for Petitioner,  
Washington, D. C.

IN THE  
SUPREME COURT OF THE UNITED STATES.

No. 40,

OCTOBER TERM, 1924.

GULF REFINING COMPANY,

*Respondent.*

---

**ARGUMENT.**

**Statement.**

The writ of certiorari in this case was issued to bring up for review from the Circuit Court of Appeals, for the Eighth Circuit, its judgment setting aside a judgment of conviction in the District Court of the United States, for the Eastern District of Oklahoma, on an indictment, and remanding the case to said District Court, with directions to grant a new trial (*Record, p. 1692*).

The indictment, in ninety-nine counts, attempts to charge the respondent with having obtained from certain common carriers concessions, from the lawful rate applicable thereto, with respect to the transportation of certain shipments alleged to have consisted of gasoline, in violation of the Elkins Act (*Rec., pp. 1-145*).

During the period covered by the indictment, there were in force, over the routes and between the points between which the transportation occurred, other and lower rates applicable to the transportation of unrefined naphtha, which rates the carriers had instituted at the respondent's request (*Rec.*, pp. 559-574).

There was and is no dispute concerning the identity of the commodity shipped. The dispute is concerning its proper name; that is, whether it is gasoline, as charged in the indictment, or unrefined naphtha, as is insisted by the respondent. The material is a liquid condensate of petroleum gas and is commonly called "casinghead gasoline", although called by many other names (*Rec.*, pp. 321, 682, 683).

It is conceded by the respondent that the material is popularly (but erroneously) called "gasoline" (*Rec.*, p. 694). On the other hand, it is conceded by the Government that the material is unfinished as gasoline (*Rec.*, pp. 883-892).

Just before submitting this issue of fact to the jury, the District Court overruled, without serious consideration, the contentions of law made by the respondent, although stating that were the defendant an individual whose liberty was at stake, instead of a corporation, he would not do so (*Rec.*, p. 899).

The jury found for the Government, and the respondent took a writ of error, assigning one hundred and nineteen errors (*Rec.*, pp. 1542-1665), almost all of which were with respect to rulings upon questions of evidence, prejudicial summing up by the Government in appealing to pecuniary interests of the jury, and the giving and refusing of certain charges to the jury by the Court.

The Circuit Court of Appeals, without passing on the questions raised by respondent concerning the application or construction of the Act or the indictment, reviewed the evidence dealing with the principal fact, *i. e.* the proper name of the commodity, and found meritorious assignments of error concerning the introduction of certain evidence and argument by the Government that it imported fraudulent conduct on the part of the respondent, which the Circuit Court of Appeals considered, in the light of the testimony in the case, was a groundless contention and highly prejudicial; that certain other testimony admitted concerning respondent's course in other circumstances was without evidentiary weight, and that other testimony concerning the course of other shippers under other circumstances, or without any showing of similarity of circumstances, was erroneously admitted. It also found meritorious assignments of error concerning statements made by counsel for the prosecution in argument of which there was no evidence in the record, and which

“could have been made for no other purpose than to prejudice the jury against”

two of respondent's expert witnesses. It also found meritorious assignments of error concerning argument by Government counsel to the jury to the effect that, the shipments having moved during the period of federal control, the jurors themselves would have to contribute (by way of income taxes) to make up any deficiency in operation, and that the defendant, by the advantage which it got over its competitors, in this way placed in its own

“pocket hundreds of thousands of dollars which they were not entitled to, and which the people of the United States have got to bear the burdens, and it is true that the Gulf Refining Company will have to join, thank goodness, the other people of the United States to pay these things if it had to be paid.”

After considering the foregoing assignments of error, the Court said (*Rec.*, pp. 1691, 1692):

“All of the assignments that have been mentioned are in our judgment meritorious, the matters complained of were prejudicial and would require a reversal. Many errors are assigned, to the admission and rejection of evidence, to the instructions of the court, to the refusal of requests to instruct, and to comments by the court during the progress of the trial, which it is claimed were prejudicial and unfair. But the view we take of the case renders it unnecessary to pass on them.

“It is our opinion that when all competent and relevant proof in the case is given a fair and impartial consideration the conclusion that the verdict is without support is inevitable. The prosecution rested its case in chief on testimony of operators of casing-head compression plants that they called the condensate and their blended products gasoline, believed they were gasoline and shipped them as gasoline; and also on the claimed admissions about which we have expressed our opinion. They could not ship their products otherwise, there was no rate on unrefined naptha or unfinished naptha to their points of destination; and as to the shipments to the Texas Company at Port Arthur, on which gasoline rates had been exacted and collected, that company had pending in the

U. S. District Court for the Eastern District of Texas at the time of the trial an action for the recovery of the difference between what it had been required to pay and the rates on unrefined naphtha. The defendant then called witnesses thoroughly familiar, technically and practically, with the recovery of petroleum and natural gas, their treatment, their component parts, their reduction to usable and marketable commodities, and they were in accord in their testimony that the commodities were appropriately designated as unrefined naphtha, were unrefined naphtha and were not gasoline, and could not be appropriately so designated. They stated the facts on which their conclusions were based. Then the best informed witnesses in behalf of the prosecution, the only ones who spoke with general information on the subject, Dr. DeBarr and Mr. Dykema, were called and both stated that casing-head condensate was too volatile and dangerous for use as gasoline—the former as a witness and the latter in his article prepared and issued as an official bulletin by the Bureau of Mines; and neither claimed that either the condensate or the blended product would fulfil any specification for gasoline.

“We think the court erred in refusing defendant’s request for an instructed verdict in its favor.”

For respondent, it is contended:

1. That the writ of certiorari should be dismissed, (a) for lack of jurisdiction in the Court to review, by certiorari (or otherwise), a judgment of the Circuit Court of Appeals in favor of a defendant in a criminal case (other than under the Criminal Appeals Act—not here

involved), or (b) because, even if there is jurisdiction in a proper case, the instant one is not such, the judgment of the Circuit Court of Appeals not being a final judgment but a remand for a new trial, and there being no extraordinary circumstances such as warrant the exercise of the power; or

2. That the judgment of the Circuit Court of Appeals should be affirmed, because the questions on which the decision of the cause depends are so frivolous as not to need further argument.

## I.

### A. Jurisdiction.

As the appellate jurisdiction of this Court is purely statutory, the initial inquiry in this case is necessarily as to the existence of jurisdiction of the review sought.

“By the Constitution of the United States, ... cases to which the judicial power of the United States extends, and of which original jurisdiction is not conferred on this court, ‘the Supreme Court shall have appellate jurisdiction, with such exceptions and under such regulations as the Congress shall make.’ Constitution, art. 3, sec. 2 This court, therefore, as it has always held, can exercise no appellate jurisdiction, except in the cases, and in the manner and form, defined and prescribed by Congress.”

*American Construction Co. v. Jacksonville Railway*, 148 U. S. 372, 378.

In *United States v. Sanges*, 144 U. S. 310, this Court, upon a writ of error, considered at length the question whether the provision of the Judiciary Act of 1891 concerning the review by it on appeals or writs of error of cases involving the construction or application of the Constitution (*Act of March 3, 1891, chap. 517, sec. 5; 26 Stat. 827, 828*) conferred upon the United States the right to sue out a writ of error in any criminal case; and, after a careful review of the English and State cases, reached the conclusion that those cases show that under the common law, and in the absence of express statutory provision giving such right to the State, a writ of error cannot be sued out in a criminal case after a final judgment in favor of the defendant, whether that judgment has been rendered upon a verdict of acquittal or upon a determination by the court of an issue of law.

The Court then, after reviewing the history of the section in question and other provisions of the Judiciary Act, reached the conclusion that the provision for review by it by writ of error, as applied to a criminal case, did not

“confer upon the United States the right to bring up a criminal case of any grade after judgment below in favor of the defendant” (*p. 323*).

And further stated:

“It is impossible to presume an intention on the part of Congress to make so serious and far-reaching an innovation in the criminal jurisprudence of the United States” (*p. 323*).

After the decision in the *Sanges case*, *supra*, by the Criminal Appeals Act (*March 2, 1907; 34 Stat. 1246*)

it was expressly provided that a writ of error might be taken on behalf of the United States from the District or Circuit Courts direct to this Court in certain specific instances; that is, from a judgment dismissing an indictment or arresting judgment thereon, where the judgment is based upon invalidity or construction of the statute; and from a judgment sustaining a special plea in bar when the defendant has not been put in jeopardy. And even in this limited class of cases it is required that the writ must be taken within thirty days and diligently prosecuted, and shall have precedence over all other cases, and that pending determination the defendant shall be admitted to bail on his own recognizance; and it is further expressly provided that in no circumstances will the writ be allowed where there has been a verdict in favor of the defendant.

It will be observed that this serious and far-reaching innovation in the criminal jurisprudence of the United States was made in most explicit terms and surrounded with explicit limitations and safeguards. It alters the rule laid down in the *Sanges case* as applied only to the particular instances embraced; that is, judgments dismissing indictments or arresting judgment thereon, for invalidity, or on the construction, of the statute, or on special pleas in bar.

In *United States v. Keitel*, 211 U. S. 370, concerning the scope of the Criminal Appeals Act, this Court said (pp. 398, 399):

“That act, we think, plainly shows that in giving to the United States the right to invoke the authority of this court by direct writ of error in the cases for which it provides contemplates vest-

ing this court with jurisdiction only to review the particular question decided by the court below for which the statute provides. In other words, that the purpose of the statute was to give the United States the right to seek a review of decisions of the lower court concerning the subjects embraced within the clauses of the statute, and not to open here the whole case. We think this conclusion arises not only because the giving of the exceptional right to review in favor of the United States is limited by the very terms of the statute to authority to re-examine the particular decisions which the statute embraces, but also because of the whole context, which clearly indicates that the purpose was to confine the right given to a review of the decisions enumerated in the statute, leaving all other questions to be controlled by the general mode of procedure governing the same."

In *United States v. Dickinson*, 213 U. S. 92, this Court, having granted its writ of certiorari to review a judgment of the Circuit Court of Appeals, for the First Circuit, setting aside a judgment of conviction in a criminal case and remanding it to the District Court "for further proceedings in accordance with law" because of the urgency of the Government as to the importance of the particular decision, notwithstanding the judgment of the Circuit Court of Appeals was not final, at the threshold of the consideration of the case found itself confronted with the question of its power to grant its writ of certiorari under the Act of 1891 in a criminal case, whatever the supposed importance of the question involved.

Section 6 of that Act (26 Stat. 826), after setting forth the jurisdiction of the Circuit Court of Appeals and

providing for the certification by it to the Supreme Court of questions upon which it desires instructions, and providing that the Supreme Court may either give such instructions or require the whole cause to be sent up for its determination in the same manner as though brought here for review by writ of error or appeal, provides:

“And excepting also that in any such case as is hereinbefore made final in the Circuit Court of Appeals it shall be competent for the Supreme Court to require, by certiorari or otherwise, any such case to be certified to the Supreme Court for its review and determination, with the same power and authority in the case as if it had been carried by appeal or writ of error to the Supreme Court.”

After calling attention to the fact that the provisions in the clauses relating to appeals or writs of error, where constitutional questions were involved, made no distinction in their language between civil and criminal cases, and no distinction as to the party who was aggrieved by the decision in the court below, and referring to its decision in the *Sanges case*, *supra*, this Court stated (213 U. S. 99) that it was there held,

“on great consideration, that the right of review given by that provision of section 5, so far as it related to criminal cases, must be limited to review at the instance of the defendant after a decision in favor of the Government. The decision was reached after a thorough examination of the Federal legislation as to appellate jurisdiction in criminal cases and of the authorities in England and in the United States relating to criminal appeals, in which the court finds no precedent without express

statutory enactment for any review of any judgment in favor of the accused."

It was argued by the Government, however, that the general power to issue writs provided by Section 14 of the Judiciary Act of 1789 would authorize its use for the purpose. But the Court said (*p. 100*):

"But that was not a grant to this court of appellate jurisdiction to review by certiorari for the mere correction of error any or all decisions of the lower Federal courts not otherwise reviewable."

And, after quoting from its opinion in *American Construction Co. v. Jacksonville Railway*, 148 U. S. 372, concerning the scope of the power of the Court to issue original independent writs, this Court said (*p. 102*):

"But the distinction between preventing excesses of jurisdiction and the mere correction of error is a fundamental one, and the rule remains that appeal and writ of error, being the proper forms of procedure provided for the mere correction of error, the appellate jurisdiction of this court for that purpose is limited to the cases in which express provision is made for appeals or writs of error, and that certiorari cannot be independently used to supply the place of a writ of error for the mere correction of error."

It was further argued by the Government in the *Dickinson* case (citing *Forsyth v. Hammond*, 166 U. S. 506, 514, 515, and *American Construction Co. v. Jacksonville Railway*, 148 U. S. 372, as authority) that it was competent, under the Act of March 3, 1891, for this Court to take away from the final determination of any Circuit

Court of Appeals, at any stage before or after decision rendered in that court, *any* case involving questions of gravity and general importance, including the review of a criminal case on certiorari on the application of the Government, to the same extent that it might review a civil case. There is nothing, however, in either of those cases to indicate that they tend to overrule or modify in the slightest what was said by the Court in the *Sanges case*. On the contrary, the statements in *Forsyth v. Hammond*, *supra*, concerning the court's authority to issue the writ—which relates more directly to the stage of the case below than to its character—are expressly limited by the preceding statement of the Court (166 U. S. 513):

“It applies to every case in which but for it the decision of the Circuit Court of Appeals would be absolutely final, and authorizes this court to bring before it for review and determination the case so pending in the Circuit Court of Appeals, and to *exercise all the power and authority over it which this court would have in any case brought to it by appeal or writ of error.*” (Italics ours.)

Manifestly if, as held by the Court in the *Sanges case*, the Court is without power *on writ of error* to review a judgment in a criminal case favorable to the accused, that would be the extent of its power and authority upon *certiorari*.

It was also argued by the Government in the *Dickinson case* that the Act of 1891 might be construed to confer upon the Government a right of review in criminal cases because the Criminal Appeals Act (passed after the decision in the *Sanges case*) provided for a writ of error

in behalf of the Government in criminal cases. But the Court rejected that argument also, again holding that the Criminal Appeals Act was strictly limited to review of judgments in the specified classes of cases only, and was not to be extended beyond its terms.

It may be taken, therefore, as settled law up to the time of the decision in the *Dickinson case* that the United States was without right, either by certiorari or writ of error, to a review of a judgment adverse to it in a criminal case, save only the cases specifically covered by the Criminal Appeals Act, and that

“so serious and far-reaching an innovation in the criminal jurisprudence of the United States”

would be deemed to have been made only by the use of most explicit language.

After the decision in the *Dickinson case*, the provision concerning certiorari contained in the Act of 1891 (now Section 240 of the Judicial Code) was amended by the addition of the words shown in black face below:

“In any case, **civil or criminal**, in which the judgment or decree of the circuit court of appeals is made final by the provisions of this Title, it shall be competent for the Supreme Court to require, by certiorari or otherwise, **upon the petition of any party thereto**, any such case to be certified to the Supreme Court for its review and determination, with the same power and authority in the case as if it had been carried by appeal or writ of error to the Supreme Court.”

The question is, does the addition of these words, “civil or criminal” and “upon the petition of any party

thereto'', in clear and explicit terms effect a change in the criminal jurisprudence of the country even more radical than did the Criminal Appeals Act? If it had the effect of conferring upon the Government a right of review of a decision adverse to it in a criminal case, it would be far more radical and comprehensive than the Criminal Appeals Act, without doubt. It would embrace not only the cases specifically enumerated by the Criminal Appeals Act, but also those specifically excepted therefrom by it, *i. e.* even cases where there had been previous jeopardy.

Of course, a construction extending it to cases of previous jeopardy would not be given, because of conflict with the Fifth Amendment; yet it is not excepted, as in the Criminal Appeals Act, but would be literally embraced.

The amendment does not purport to affect the Criminal Appeals Act. Yet, giving it the construction suggested, it would have the practical effect of repealing the limitations—such as personal recognizance and expedition—contained therein by the simple alternative of applying for a writ of certiorari instead of a writ of error.

Dealing now with the question of power—propriety aside, for to government bureaus all prosecutions are of peculiar gravity and general importance—the Government would be entitled to seek a review in every criminal case in which a conviction was reversed by the Circuit Court of Appeals, regardless of the character of error involved. By far the great majority of such cases turns solely on ordinary questions of evidence. Yet it is to be supposed that this Court might be importuned to review

*Amendment  
not applied  
enough*

*1.*

every such case. If such was the object of the legislation, the conferring of jurisdiction in the Circuit Court of Appeals to render *final* judgments would be a misnomer and a vain gesture. Could not more apt language be found to affect any such legislative intention? No difficulty was experienced in finding it for the Criminal Appeals Act. That Act does not conceal the right under the phrase "upon the petition of any party", but says "by and on behalf of the United States." The addition of the words "civil or criminal" does not necessarily enlarge the provision beyond the scope of the Act at the time of the decisions of the *Sanges* and *Dickinson* cases. The phrase "any case" certainly includes both civil and criminal cases, and criminal cases were certainly among those in which the judgment of the Circuit Court of Appeals was made final.

A meaning can be found for the added words without construing them as effecting such a radical change. Defendants jointly indicted are both parties to a criminal case, and it may be that the object of the language was to confer upon one of them the right to invoke the privilege, whether the other joined in the petition or not.

If it be intended that the Government, as a party in a criminal case, should have the benefit of the amended statute, cases are conceivable where the Government might apply for certiorari that would not involve a review of a decision of the Circuit Court of Appeals adverse to the Government in a criminal case. For example, it might be used to remove a criminal case of widespread importance from the Circuit Court of Appeals *before* final judgment by that court, in order to se-

cure an authoritative determination by this Court. The right might be used to remove a writ of error from the Circuit Court of Appeals (before decision) because one of the Judges thereof had participated in the decision below, as, for instance, in *American Construction Co. v. Jacksonville Railway*, 148 U. S. 372, 383. Such instances would be fundamentally different from permitting the Government to speculate, first, on its chances in the Circuit Court of Appeals, and then, on being defeated there, to vex and harass a defendant by what would amount to a second appeal. This Court has said repeatedly that the function of the writ of certiorari is not to accord a defeated party another chance.

“The jurisdiction was not conferred upon the court merely to give the defeated party in the Circuit Court of Appeals another hearing.”

*Magnum Import Co. v. Coty*, 262 U. S. 159, 163;  
67 L. Ed. 922.

The Government may suggest that reference to the debates in Congress will show that the intent of the amendment was to confer upon it, in the discretion of this court, the right to a review of judgments adverse to it in criminal cases, notwithstanding this court has repeatedly said that they are

“not appropriate sources of information from which to discover the meaning of the language”

used, as in *United States v. Trans-Missouri Freight Assn.*, 166 U. S. 290, where it further said (p. 318):

“The reason is that it is impossible to determine with certainty what construction was put

upon an act by the members of a legislative body that passed it by resorting to the speeches of individual members thereof. Those who did not speak may not have agreed with those who did; and those who spoke might differ from each other; the result being that the only proper way to construe a legislative act is from the language used in the act, and, upon occasion, by a resort to the history of the times when it was passed."

Such a reference in the instant case not only does not support the construction suggested, but most aptly illustrates the situation above suggested by the Court.

From a reference to the Congressional Record of February 8, 1911, it would appear from the questions of Senator Heyburn and the replies of Senator, now Mr. Justice, Sutherland, that the latter considered the amendment would work the result suggested. After the bill went to conference, however, the House Conference Committee Report (*46 Cong. Rec.*, p. 4001) showed an entirely different conception of the purposes and effect of the change. It is as follows:

"The other amendments made by the Senate, embracing substantive changes were as follows:

\* \* \* \* \*

"Section 240 (227). The insertion of the words, 'civil or criminal,' and the words, 'upon the petition of any party thereto.' The effect of this amendment is to make more clear the right of the Supreme Court of the United States by writ of certiorari to bring before it for review any case in which the judgment or decree of the Circuit Court of Appeals is made final by the provisions of the Act, and to define more accurately the method by which such writ might be obtained."

Granting a new right is not making "more clear" an existing right, nor is the providing of process for the exercise of a right newly granted equivalent to "define more accurately the method" of exercise of an existing right. And such a resort, for the purpose of proving the intent of the legislation, proves too much; for such a necessity is at once an admission of the absence of clear and explicit terms, such as this Court, in the *Sanges* case, considered requisite, and such as was employed in the Criminal Appeals Act. However, regardless of the intent of the legislation, it is beyond cavil that what was done, rather than what was intended, controls.

No change whatever was even attempted to be made in the scope of review. Whatever change may have been effected in the class of cases or the parties made eligible to petition, the "power and authority" in the case were left the same as before; that is, to review

"with the same power and authority in the case as if it had been carried by appeal or writ of error to the Supreme Court."

Appeal, of course, has no place in the discussion.

As held in the *Sanges* case, before the Criminal Appeals Act, this court had no power or authority to review, by writ of error,

"a criminal case of any grade after judgment below in favor of defendant."

By the Criminal Appeals Act, jurisdiction was conferred to review by writ of error a certain limited class of judgments adverse to the Government in criminal

cases. In both the *Keitel* and *Dickinson* cases, the Court held that such review by writ of error was strictly limited to the enumerated cases. A grant, therefore, of the alternative writ of certiorari, expressly limited to "the same power and authority of review" existing by writ of error, does not, through any inherent quality of the writ of certiorari, enlarge the scope of review. It would be a contradiction in terms. Nor, *a fortiori*, in the face of such contradictory terms, is it possible

"to presume an intention on the part of Congress to make so serious and far-reaching an innovation in the criminal jurisprudence of the United States."

Since the amendment of 1911, in several instances the Government has petitioned for certiorari to review a judgment adverse to it in a criminal case, but in each instance—other than the present case—the court has refused to grant the writ, without opinion.

*United States v. A. Gero Marshall*, 226 U. S. 607.

*United States v. John H. Patterson*, 238 U. S. 635.

## B. Propriety.

If it is considered that the Court has jurisdiction to review, under the writ, a judgment adverse to the Government in a criminal case, then it is contended that the instant case is not a proper one to appeal to the court's discretion.

The Court has repeatedly said that it will exercise its discretion to review by certiorari,

“sparingly and with great caution, and only in cases of peculiar gravity and general importance, or in order to secure uniformity of decision.”

*American Construction Co. v. Jacksonville Railway*, 148 U. S. 372, 383.

*Lau Ow Bew, Petitioner*, 141 U. S. 583; s. c., 144 U. S. 47.

*Magnum Import Co. v. Coty*, 262 U. S. 159, 163; 67 L. Ed. 922.

It is well settled that, except in such extraordinary cases as *Forsyth v. Hammond*, 166 U. S. 506, the Court will not issue its writ except to review a final judgment.

*American Construction Co. v. Jacksonville Railway*, 148 U. S. 372, 384.

*The Conqueror*, 166 U. S. 110, 113.

*The Three Friends*, 166 U. S. 1.

*Chicago & Northwestern Ry. Co. v. Osborne*, 146 U. S. 354.

In the instant case there is present not one of the considerations which the Court has indicated appeal to its discretion. There is not even a final judgment, but, instead, the mandate is for a new trial (*Rec.*, p. 1692).

It may be that the Court granted the writ on the erroneous representation of the petitioner—doubtless inadvertently made in the absence of the mandate—that the Circuit Court of Appeals had “reversed and remanded for dismissal” the case, when the errors found by the Court “warranted the Circuit Court of Appeals at most in remanding the case for a new trial”; as the conclu-

sion of the petitioner's argument is that the writ should be issued

"in view of the public importance of the questions involved, and the extraordinary action of the Circuit Court of Appeals in reversing and remanding for dismissal, instead of at most remanding the case for a new trial." (*Petition*, pp. 8, 9).

With the record containing the mandate available now, however, it is apparent that the grounds supposed to have warranted an exception to the rule against removal before final decree do not exist.

If the representations contained in the petition were not made under a misapprehension as to the contents of the mandate, they must have been made under a misapprehension of elementary principles concerning what constitutes finality of judgments.

This Court has repeatedly held that a mandate for a new trial, or even a direction to proceed in accordance with the opinion or law, is not a final judgment.

As stated in *Hazeltine v. Central Bank, etc., No. 1*, 183 U. S. 130,

"The face of the judgment is the test of its finality."

*Chicago & Northwestern Ry. Co. v. Osborne*, 146 U. S. 354, not only was a direction to proceed in accordance with the opinion which involved a holding by the Circuit Court of Appeals that a verdict should have been instructed for the defendant, but it also involved a question of the construction of the Interstate Commerce Act, which this case does not. Yet certiorari was denied, because the judgment was not final.

The petition shows no other extraordinary questions of peculiar gravity or general importance. There is no question of international importance, treaty construction, or uniformity of decision involved; nor is there any question of constitutional law or statutory construction involved. The only questions of statutory construction occurring in the case at all were those raised by the respondent, and ruled against it by the District Court; and, although such rulings were assigned as error and argued in the Circuit Court of Appeals, that Court decided none of them, but based its decision purely on questions of evidence, as is apparent from the excerpts from its opinion, *ante pp. 6, 7 (Rec., pp. 1691, 1692)*. The most important of these questions of law raised by the respondent in the District Court was that under the authority of the *American Tie & Timber Co. case*, 234 U. S. 138, the question of the proper classification of the commodity shipped was an administrative one within the exclusive primary jurisdiction of the Interstate Commerce Commission to decide, which contention the Government there vigorously opposed and was sustained by the District Court, and, as before stated, the Circuit Court of Appeals did not pass on respondent's assignments of error in that ruling.

Now, however, in a deft effort to raise a question appealing to the exercise of this court's discretion, the Government, in this court, in effect attempts to reverse its position and for the first time contend that the doctrine theretofore opposed by it is applicable. Why? Because, since the trial of the case, the Interstate Commerce Commission has rendered a decision (*Southern Carbon Co. v. A. & L. M. Ry. Co.*, 62 I. C. C. 733) which

it is claimed decided impliedly that the proper classification of the material is "gasoline", and which decision, under the doctrine of the *American Tie & Timber Co. case, supra*, presumably it would be contended is controlling in this case (*Petition, p. 6*). But the claim itself is specious, as a reference to the decision of the Commission will readily disclose. The Commission did not have under consideration the question whether the classification of gasoline or that of unrefined naphtha was applicable; there were no unrefined naphtha rates or classification involved in the case. The question considered and decided in that case was purely whether the rates on gasoline, as applied to the condensate there involved, were reasonable. There is not even anything in the report of the Commission to indicate that the condensate involved in that case was the same as that involved in the instant case. But, all this aside, there is, for review or correction, no judgment or ruling of the Circuit Court of Appeals on the point.

The only other alleged ruling of supposed gravity or general importance attempted to be set up by the petition is the supposed practical nullification of

"the powers of the Government under the so-called Transportation of Explosives Act",

growing out of the fact that

"the opinion of the Circuit Court of Appeals *does not even mention* the Commission's explosive regulations." (*Petition, p. 5*).

Here again is an effort upon the part of the Government to raise in this court, for the first time, a question

which did not even exist in the court below—and that by taking a position directly opposite to that taken by it in the District Court. The obvious purpose is an ingenious attempt to argue to this court that, because of the fact that the safe transportation regulations prescribed by the Interstate Commerce Commission are published by the carriers in their classifications, those regulations thereby become controlling descriptions for rate purposes. This argument was not attempted to be made in the District Court—and could not be consistently made with the way the indictment is pleaded. On the contrary, the Government expressly conceded that it was not contending that the safe transportation regulations as such had not been complied with (*Rec.*, pp. 221-230, 429-441); and the Court instructed the jury that they were not in question (pp. 928, 929, 942, 943). This concession would itself destroy the Government's case, even if there was any merit in the argument; but it is in fact utterly without merit. In the first place, the rules in question are rules promulgated by the Interstate Commerce Commission under the Transportation of Explosives Act (35 Stat. 1134)—not under its authority to prescribe rates and classifications for rate purposes—and are a set of rules which govern the packing and the description to be used in billing and labelling the articles covered thereby, in the interest of safety (*Rec.*, p. 1241). And finally the argument destroys itself because one of the first rules of those regulations, *i. e.* 1712, is that such articles

“must be properly described by the shipper in his shipping order and bill of lading under the specific

or general name provided for the description of such freight *by the carrier's classification and tariff governing.*" (*Rec.*, p. 1243).

Manifestly, if the specific name of the material shipped was "unrefined naphtha", the very rules themselves would require the use of that description for *classification and rate purposes*, even though an additional different description was required by subsequent rules for safety purposes. Moreover, no such conflict in fact existed in the rules in force prior to September 1, 1918, which merely provided, so far as safety was concerned, that, while certain other condensate *must* be shipped under the description "liquefied petroleum gas," that here involved "*may be* described and shipped as gasoline" (*Rec.*, pp. 429-441, 1225).

The rules governing safety description in force from September 1, 1918, provided that the condensate here involved

"*must* be described and shipped as gasoline, casinghead gasoline, or casinghead naphtha" (*Rec.*, p. 1259);

and the evidence shows, not only by the shipping orders themselves, which are exhibits in the case (*Rec.*, pp. 942, 943), but also by the express admission of the Government, that this regulation was complied with by the use of the double descriptions "Casinghead Naphtha" and "Unrefined Naphtha" on the shipping orders (*Rec.*, pp. 227, 229, 230, 942, 943).

However, as previously pointed out, in this respect also there is no question, ruling or judgment involved in

the Circuit Court of Appeals' opinion or mandate affecting the subject in any way whatever.

There is in fact involved therefore in the judgment of the Circuit Court of Appeals no decision of any question of law for review by this Court. Upon a review thereof this Court might differ with the Circuit Court of Appeals concerning the admissibility of evidence, or upon the conclusion of fact from the legitimate evidence in the case, which it may be claimed is inferred by that court's conclusion that a verdict for the defendant should have been directed thereon. But it is not understood that this Court issues its writ of certiorari for the exercise of any such function.

*Southern Power Co. v. N. C. Pub. Ser. Com.,*  
— U. S. —; 68 L. Ed. 198 (No. 110, October  
Term, 1923, decided Jan. 7, 1924).

*Union Pacific Ry. Co. v. United States*, 116 U. S.  
154.

*United States v. Patterson*, 238 U. S. 635, where this Court declined to issue its writ, presented a situation practically identical with that here involved.

Under the circumstances above pointed out, it is thought that this court granted its writ under a misapprehension as to the questions or situation involved, and, upon being thus advised of the actual situation and questions involved, will dismiss it as having been improvidently issued.

## II.

**The judgment of the Circuit Court of Appeals should be affirmed,** because the questions on which the decision of the cause depends are so frivolous as not to need further argument.

Since if this Court should agree with the Circuit Court of Appeals that prejudicial error had occurred in the trial of the case its judgment would be to affirm the mandate of that Court for a new trial, it remains to be seen whether the conclusions of the Circuit Court of Appeals concerning the assignments of error upon which it passed are open to other than frivolous argument.

The first group of assignments of error (*Rec.*, pp. 1544-1548, 1550-1553, 1599-1601, 1632, 1638, 1640, 1641, 1663) ruled upon by the Circuit Court of Appeals (p. 1690) was as to the insistence of the prosecution throughout the trial, during the introduction of evidence and in argument, that the conduct of the defendant was fraudulent. One of the grounds of this insistence was the fact that the defendant's traffic agent had asked the carriers to institute the lower rates on unrefined naphtha, whereas until then the product had been shipped under the designation "gasoline".

In the first place the evidence itself was utterly inadmissible, because it had no probative force whatever and was a clear violation of the *res inter alios acta* rule.

If there had been unrefined naphtha rates, as well as gasoline rates, in force at the times the commodity had been shipped under the designation "gasoline", offering

a choice of terms, the evidence might have had some probative force on the theory of admissions.

*1 Wigmore on Evidence, Secs. 32, 33, 442.*

*Lake Erie & W. R. Co. v. Muff, 132 Ind. 168.*

*Chicago, St. L. & P. R. Co. v. Champion, 32 N. E. Rep. 874.*

*Emerson v. Lowell Gaslight Co., 3 Allen, 410, 417.*

*Hunt v. Lowell Gaslight Co., 8 Allen, 169, 171.*

*Baxter v. Doe, 142 Mass. 558, 561.*

*Reeve v. Dennett, 145 Mass. 28.*

*State v. Justus, 11 Oregon, 182.*

*Leonard v. Southern Pacific Co., 21 Oregon, 555, 559.*

*Cohn v. Saidel, 71 N. H. 558; 53 Atl. Rep. 800.*

*U. S. Fidelity & G. Co. v. Des Moines National Bank, 145 Fed. Rep. 273.*

*Bird v. United States, 180 U. S. 356, 359.*

*Barney v. Rickard, 157 U. S. 352, 367.*

*Thompson v. Bowie, 4 Wall. 463, 471.*

*United States v. Ross, 92 U. S. 281.*

*Hall v. United States, 150 U. S. 76, 81.*

*United States v. Baxter, 46 Fed. Rep. 350.*

The Government argued in the Circuit Court of Appeals that the evidence was relevant because, if the material was not gasoline, shipping it as such would have been a crime under the Interstate Commerce Act.

If such were in fact the case, it of course would not make the evidence relevant; but such is not the fact in any event.

It might well be that, under what is known as the analogy rule of carriers' classifications, "gasoline"

would be the nearest analogous article in the absence of a specific classification "unrefined naphtha".

The Interstate Commerce Commission has itself repeatedly held that where under the classification two designations might be applicable, the more specific would prevail.

*Colorado C. & F. Co. v. Atchison, T. & S. F. Ry. Co.*, 83 I. C. C. 267.

*U. S. Industrial Alcohol Co. v. Southern Ry. Co.*, 68 I. C. C. 389.

*Highland Park Mfg. Co. v. Southern Ry. Co.*, 26 I. C. C. 67.

*Augusta Veneer Co. v. Southern Ry. Co.*, 41 I. C. C. 414.

But where there are two descriptions equally appropriate, the shipper is entitled to take the one upon which the lower rate applies.

*Ohio Foundry Co. v. P. C. C. & St. L. Ry. Co.*, 19 I. C. C. 65.

*St. Louis B. F. Co. v. Virginian Ry. Co.*, 24 I. C. C. 360.

*United Verde C. Co. v. Pennsylvania Co.*, 48 I. C. C. 663.

*National Elevator Co. v. Chicago, M. & St. P. Ry. Co.*, 246 Fed. Rep. 588.

And the repeated insistence of the Government that such evidence imported fraud on the part of the defendant, in the face of the fact that the Interstate Commerce Commission itself had in its decision (which was received in evidence) in the *National Refining Co. case*, 23 I. C. C. 527, required the establishment of rates on substantially

the same commodity on the same basis upon which the carriers established the unrefined naphtha rates, could not but be highly prejudicial.

The next group of assignments of error (*Rec.*, pp. 1546-1550, 1591, 1595, 1596) ruled upon by the Circuit Court of Appeals (*p.* 1690) was as to the admission of evidence to the effect that defendant's subsidiary concurrently shipped the same commodity to defendant at Pittsburgh, Pa., under the designation "gasoline".

The evidence further showed that there were no unrefined naphtha rates to Pittsburgh, and consequently there was no choice of terms.

The evidence was therefore without probative force whatever, as held by the Circuit Court of Appeals and as shown by the foregoing authorities.

The next group of assignments of error (*Rec.*, pp. 1569-1588, 1640-1645) ruled upon by the Circuit Court of Appeals (*p.* 1690) was with respect to the admission of a large mass of testimony concerning the practice of numerous other shippers (in no wise affiliated with the defendant) in shipping condensates produced by them as "gasoline", when the evidence showed that in such instances there was no choice of descriptions available. It further was not shown in some instances whether the material shipped by such other shippers was the same, or even substantially the same, as that shipped to defendant; and in the other instances it was shown that it was in fact different, and in some cases quite substantially so.

This evidence not only violated every element of the *res inter alios acta* rule—and was pure hearsay, so far

as the defendant was concerned—but it lacked even the claim to the quality of admissions made as to the evidence dealt with in the two preceding groups of assignments of error.

The next two assignments of error (*Rec.*, p. 1663) ruled upon by the Circuit Court of Appeals (*pp.* 1690, 1691) were: (*a*) statements by Government counsel in argument that the scientific institute with which two of defendant's expert witnesses were connected was founded by defendant's president, concerning which there was no evidence of the kind in the record, and which, as the Circuit Court of Appeals said,

“could have been made for no other purpose than to prejudice the jury against”

those witnesses (*Rec.*, p. 1691); and (*b*) argument to the jury by Government counsel to the effect that the jurors had a pecuniary interest in the verdict, in that they would be required to contribute to the deficit from government operation of railroads which would be increased by the alleged fraudulent conduct of defendant.

It is not uncommon for prosecutors to go outside the record or make misstatements in the course of argument concerning some of the facts in issue, and such action may not always be considered necessarily prejudicial. But when, as here, the matter in question has no relation to the issues, and the conduct could have no other possible purpose than an attempt to prejudice the jury, the prosecution ought not to be heard to argue that such course was not in fact prejudicial. Surely in making such statements the prosecutors must have believed they

would have been efficacious in prejudicing the defendant, else why would they have indulged in them? Can the Government with any sincerity argue to this Court now, that, although the result sought by the prosecutors was accomplished, it was not contributed to by that which those prosecutors designed should contribute thereto?

The remaining assignment of error (*Rec.*, p. 1691) ruled upon by the Circuit Court of Appeals (*Rec.*, p. 1691) was the refusal to instruct a verdict for the defendant.

When the case is stripped to the legitimate evidence in it, it is scarcely arguable that a verdict ought not to have been instructed. The evidence erroneously admitted constitutes probably more than three-fourths of the whole. Apparently the prosecution considered it not only legitimate evidence, but necessary, else why would it have so insistently urged it upon the Court, over defendant's objections? If the Government *then* thought such evidence was necessary to make out its case, how can it argue *here* that the Circuit Court of Appeals erred in holding that without this great mass of evidence there was insufficient to go to the jury? The Government's petition itself concedes almost unreservedly that there were errors warranting a new trial (*Petition*, pp. 8, 9). What other judgment could be entered than that contained in the mandate of the Circuit Court of Appeals—a new trial?

“But if, in point of law, the judgment ought to be affirmed, it is the duty of this court to affirm it (6 Cranch, 268). We cannot, with propriety, re-

verse a decision which conforms to law, and remand a cause for further proceedings."

*Benney v. Chesapeake & Ohio Canal Co., 8 Peters, 214.*

### CONCLUSION.

It is submitted that either the motion to dismiss or that to affirm should be granted.

Respectfully submitted,

R. L. BATTS,

JAMES B. DIGGS,

FRANK M. SWACKER,

## BRIEF FOR RESPONDENT.

---

H. L. STONE, JR., Pittsburgh, Pa.,  
R. L. BATTS, Austin, Texas,  
JAMES B. DIGGS, Tulsa, Okla.,  
FRANK M. SWACKER, New York City, N. Y.,  
*Counsel for Respondent.*

## INDEX.

---

	PAGE
STATEMENT .....	1
PART I.	
Jurisdiction .....	2
Grouping of respondent's assignments of error in the District Court .....	68
PART II.	
The indictment not having been read to the grand jury, cannot be said to be their conscious and intelligent action, and therefore the motion to quash the plea in abatement should have been sustained (Assignments of Error I, II, III and CXVIII [1]) .....	70
PART III.	
Demurrers .....	79
(a) All the counts of the indictment are in- sufficient in law, in that they wholly fail to state facts sufficient to show that an offense has been committed against the laws of the United States, and that they contain conclusions of the pleader instead of allegations of material facts, and there- fore the demurrer should have been sustained .....	80
(b) The Elkins Act provides for punishment as a crime of shippers and carriers only,	

	PAGE
whereas the indictment shows on its face that defendant is neither .....	90
(c) Counts 36 to 40, inclusive, 65 to 80, inclusive, and 80 to 100, inclusive, of the indictment, covering shipments during Federal control, are bad both in pleading and in substance .....	95
(d) Special demurrer (Assignments of Error IV and CXVIII [5]) .....	110
PART IV.	
Errors occurring on the trial .....	112
(a) Assignments of Error VI, denial of defendant's motion to instruct a verdict of acquittal upon the admissions of the Government's opening statement; LXXXII, denial of defendant's motion at the close of the evidence to instruct a verdict of acquittal; CXVII (13, 14 & 15), denial of motion to set aside the verdict; CXVII (5), denial of motion in arrest of judgment .....	112
(1) It is a scientific fact, of which the court has judicial knowledge, that the liquid condensate of casinghead gas (unblended or blended as shipped to defendant) is not gasoline, but, on the other hand, is appropriately described as unrefined naphtha .....	113
(2) The opening statement of the Government admitted, and the undisputed evidence showed, that the material shipped was not gasoline, as alleged in the indictment, but liquid condensate of casinghead gas, resulting in a fatal variance between the charge and the proof.....	118

- (3) The Government's opening statement and the proof show a controversy as to the proper construction of tariffs, thus ousting the court of jurisdiction, because jurisdiction to construe tariffs is exclusively confided to the Interstate Commerce Commission under the Act to Regulate Commerce and decisions of this Court thereon ..... 122
- (b) The evidence received on the theory of admissions by defendant and the Gypsy Oil Company, consisting in a practice of calling liquid condensate of casinghead gas by the appellation "gasoline" at other times and under other circumstances was improperly admitted, and prejudicial ..... 129
- (c) The evidence as to the practice of certain other concerns unconnected with defendant, of calling or describing as "gasoline" material shipped or produced by them, said material in some instances shown to have been different from, and in other instances not shown to be of the same character as, that shipped to defendant, and the material circumstances surrounding such description being expressly shown in some cases to have been different from, and in no case shown to be the same as, those surrounding the shipments to defendant, was inadmissible for the purpose for which admitted, *i. e.*, of proving the proper name of the commodity shipped to defendant; and it was not competent to establish custom by showing individual instances ..... 147

- (d) Evidence that the Texas Company paid gasoline rates on certain shipments to it was not competent to prove an unlawful discrimination in favor of defendant; and refusal of the court to allow defendant to show that the Texas Company subsequently sued to recover excess of gasoline rate over unrefined naphtha rate was highly prejudicial .....

158
- (e) Evidence that certain witnesses had operated automobiles with insufficiently identified materials, admitted as tending to show that proper name of material shipped to defendant was gasoline, was incompetent and prejudicial .....

162
- (f) Admission, over objection for lack of proper foundation, of testimony as to an alleged test by a Government expert, which was subsequently shown to have been a false test, was highly prejudicial even though subsequently stricken out..

164
- (g) The admission, before the establishment of the *corpus delicti*, of evidence supposed to tend to establish intent was improper; and the evidence in question was not competent for the purpose for which it was admitted .....

166
- (h) The evidence concerning the rates in force does not sustain the charge .....

175
- (i) The rejection of evidence offered by defendant showing use of names other than "gasoline", by other parties; the representations actuating the carriers in establishing the unrefined naphtha rates; the fact that the laws of Texas prohibit and make criminal the calling of the material

	PAGE
shipped gasoline or gasoline in conjunction with any other word; that the laws of Oklahoma concerning gasoline do not embrace this material; the fact that inspection and taxation by the corporation commission of Oklahoma does not embrace this material as gasoline,—was erroneous .....	183
(j) The rejection of other evidence offered by defendant was erroneous .....	193
(k) Inflammatory, prejudicial and unfair comment and improper procedure indulged by Government counsel and the court in the presence of the jury resulted in the denial to defendant of a fair trial .....	201
(l) The court should have directed a verdict of acquittal .....	206
(m) Refusal of instructions to the jury requested by defendant was error .....	210
(n) The refusal of the court to set aside the verdict and to arrest judgment and the imposition of sentence, was erroneous...	217
Conclusion .....	218

IN THE  
SUPREME COURT OF THE UNITED STATES  
No. 40,  
OCTOBER TERM, 1924.

---

UNITED STATES OF AMERICA,  
*Petitioner,*  
*vs.*  
GULF REFINING COMPANY,  
*Respondent.*

---

**BRIEF FOR RESPONDENT.**

**Statement.**

After this case was brought here by writ of certiorari upon the Government's petition, the respondent moved to dismiss the writ or affirm the judgment of the Circuit Court of Appeals. With these motions the respondent filed its argument, in which it contended that review by certiorari of a judgment of the Circuit Court of Appeals awarding a new trial in a criminal case, was not within the appellate jurisdiction of this Court, or, even if within such jurisdiction, that the writ had issued improvidently on the erroneous representations contained in the Government's petition, and, in any event, even though the writ properly issued, the judgment of the Circuit

Court of Appeals directing a new trial should be affirmed because of the numerous errors committed on the trial.

In response to these motions the Solicitor General filed a brief on behalf of the United States, which he announced would stand as the Government's brief on the merits as well. The Director General of Railroads was also permitted to file a brief as *amicus curiae*.

The Court reserved further consideration of the motions to dismiss or affirm until the hearing on the merits.

## PART I.

### Jurisdiction.

The Government's whole case is dependent on one single issue of fact; that is, whether the material shipped to respondent was gasoline, and not properly describable as unrefined naptha as contended by respondent.

Finding numerous other errors, the Circuit Court of Appeals also held that the District Court erred in refusing to grant the respondent's motion for an instructed verdict, upon the ground that, stripped of a mass of evidence erroneously admitted, the conclusion was inescapable that the material in question could not properly be called gasoline.

Laboring under the erroneous assumption that the Circuit Court of Appeals had directed that the indictment be dismissed, instead of that a new trial be awarded, the posture of the Government on its petition for the writ was that, conceding the other errors, the Circuit Court of Appeals was warranted in "at most remanding the case for a new trial" (*Petition, V*). On the error of this assumption becoming evident, the position of the Government now is, first, that there were no errors committed on the trial, and second, even if there were any such errors, that at least the conclusion of the Circuit Court of Appeals that the material in question could not

be called gasoline is erroneous in fact, and it at least should not be allowed to stand, because it is contended that the Government will be prejudiced in other cases and in other matters if the *opinion* of the Circuit Court of Appeals on this point is allowed to stand unreversed.

The respondent does not concede that the Government will be prejudiced in the more important respects contended in the petition, which matter will be considered hereinafter, but, to the extent that it is true that the Government will be prejudiced in other cases by the opinion of the Circuit Court of Appeals, it follows that in asking this Court to pass upon this issue of fact and reach a contrary conclusion to that reached by the Circuit Court of Appeals the Government is seeking not merely to remove such prejudice, but instead to create a situation of prejudice against respondent and certain individuals in such other cases.

As therefore the principal ground upon which the Government contends the writ should be retained and the opinion of the Circuit Court of Appeals reviewed depends upon the Government's contention that the Circuit Court of Appeals erred in holding that the material could not properly be called gasoline, the Government in its brief has elaborately abstracted the evidence tending to substantiate its contention that the material should be called gasoline; which renders it necessary for the respondent to deal with this issue of fact under this point of the brief instead of in its normal place.

There is no dispute between the parties as to the identity of the substance shipped. The dispute is as to its proper name.

The material in question is the liquid condensate (blended or unblended, as hereinafter described) of a gas flowing from oil wells called casinghead gas. The condensate is commonly called casinghead gasoline.

At the time the shipments moved there were in force rates on "gasoline" and also on "unrefined naphtha", the

latter substantially lower than the former; but none under the description "casinghead gasoline". The material was shipped to respondent under the designation "unrefined naptha", and the rate applicable thereto paid.

The indictment alleges that gasoline was transported, and in the District Court the Government attempted to prove that the material is in fact gasoline. The respondent, on the other hand, offered proof that the material is not gasoline, and, further, that the term "unrefined naptha" is an appropriate description for it.

When the gas is liquefied by compression the condensate has a vapor tension in excess of 10 pounds to the square inch.

Under what are known as the Safe Transportation Regulations of the Interstate Commerce Commission and the carriers, liquid condensate having a vapor tension in excess of 10 pounds to the square inch cannot be shipped in ordinary tank cars, and must be shipped in special equipment. In order, therefore, to bring the condensate to below ten pounds vapor tension, so that it may be shipped in ordinary tank cars, it was the practice of the respondent's subsidiary at one of its plants to subject the condensate to a process called "weathering", which consists in heating it, and thus driving off the lighter particles, and at the other two plants to reduce the tension of the condensate by blending with it naptha shipped from the refinery at Port Arthur to the casinghead plant for that purpose. The naptha is a substantially heavier product than the condensate, and by the addition of one-third of the heavy naptha to two-thirds of the condensate the blend was brought to a vapor tension just under 10 pounds. The term "naptha", as last used, is the specific name of one of the products of the distillation of petroleum. The word "naptha" however is also a generic name, embracing all those fractions and their products arising from the distillation of petroleum which are lighter than kerosene. In its generic use the

term "naptha" therefore embraces naptha (specific), benzine and gasoline, as well as the mass of material from which they are extracted.

None of the foregoing facts are disputed. The dispute hinges on the proper definition of the word "gasoline" and the propriety of calling the material "unrefined" naptha.

Conceding, for the purposes of the argument under this point, that all the proof offered by the Government was properly admissible, it amounts in substance to this:

(1) On Direct. That before the establishment of the unrefined naptha rates respondent's subsidiary shipped to it the identical commodity described as gasoline, and that respondent's traffic manager wrote letters to the carriers during such preceding time requesting the establishment of rates on gasoline to cover the movement of the commodity;

(2) That coincident with shipments to Port Arthur under the designation "unrefined naptha", other shipments were made to Pittsburgh—to which point there were no unrefined naptha rates—of the same material described as "gasoline".

(3) That some employees around the casinghead plant were accustomed to calling the material "gasoline";

(4) That other shippers of material, in some instances identified as being substantially similar to that shipped to respondent, in other instances the material not particularly identified as being similar, and in still other instances material shown to be decidedly different, called it "gasoline" and shipped it under the designation "gasoline"; there being no unrefined naptha rates in effect to the points to which they shipped;

(5) That still other shippers shipping substantially the same material, where there were unrefined naptha rates available, had shipped it as "gasoline";

(6) That certain employees at respondent's refinery had been accustomed to designate the material as "Kiefer gasoline" or "Kiefer gas" in certain records, which records had been erased and mutilated prior to their production before the grand jury.

(7) And extracts from the Interstate Commerce Commission's safe transportation regulations, permitting during a part of the period of time the use of the description "gasoline", and during the balance of the time requiring the use of one of the descriptions "gasoline", "casinghead gasoline" or "casinghead naptha" (which last description respondent did use in compliance with the rule, in addition to the term "unrefined naptha").

In opposition to this evidence the defendant called six expert witnesses—five of them unconnected with it, and including some of the most eminent petroleum engineers in the world—all of whom testified unequivocally that the material in question was not gasoline in any proper sense of that word. They gave varying definitions of the word "gasoline", but all in substance agreed that it was a product of petroleum within certain ranges of boiling points, suitable for every-day use for carbureting or vaporization purposes, such as operating an automobile, gasoline stove, or launch; and that this material, on account of a preponderance of so-called lighter ends, and because of its volatility, and other objections mentioned, would not comply with any specification for gasoline and would not be suitable for such ordinary every-day use. They testified further that in order to make the material into gasoline it was customary to send it to a refinery—as was respondent's custom—in order that its boiling points might be corrected by blending it with heavier material; that blending was an important part of the art of refining; that the material unquestionably came within the generic description "naptha", and that since it was necessary to subject it to further blending—a refining process—the designation "unrefined naptha" was

entirely appropriate. It was also shown by one or more of them that a certain standard work on the technology of petroleum used the term "unrefined naptha", and defined it as being naptha within certain boiling-point limits, within which limits this material is embraced. They also testified that they had made certain tests with the material and that it refused absolutely to budge an ordinary motor car under ordinary circumstances.

The respondent further offered to prove, but was not permitted to do so, that it was contrary to the laws of Oklahoma to sell the material as gasoline and it was not treated as such for taxation and inspection, and that it was contrary to the laws of Texas to sell, ship or for any other purpose to describe this material as gasoline. Respondent also offered to prove, but was not permitted to do so, that the only other shipper who shipped the material as gasoline, where unrefined naptha rates were available, had, after discovering these rates, filed suit for the recovery of the difference between the gasoline and the unrefined naptha rates, and that that suit was then pending undecided.

Respondent also showed that it had never sold any of the material as gasoline, but that all of it shipped to Port Arthur was there blended with other materials to make gasoline.

The Government was then allowed to call in rebuttal two petroleum engineers, both of whom testified that the material was gasoline and could not appropriately be called "unrefined naptha". The first admitted, however, that he used the word "gasoline" as a generic word interchangeable with "naptha" in its generic sense, and he admitted that the material was unfinished, needing correction of its boiling points before being usable for ordinary purposes of gasoline, and that, while he himself could so use it, he would not trust it to his wife for use in place of gasoline. He also admitted that "naptha" would be a proper designation, but based his contention

that it could not be called "unrefined naphtha" on the ground that he considered the material pure, that is, free of impurities, and that he construed the word "refining" as being limited to the removal of impurities. Under this construction of the term, a crude petroleum oil, free of impurities, would be refined oil—a patent contradiction in terms.

The other Government expert took the same position in regard to the meaning of the word "unrefined", but he was forced to admit the authorship of an article prepared by him, and issued as an official bulletin by the Bureau of Mines, stating that the condensate was too volatile and dangerous and not suitable for use as gasoline.

During the trial joint tests were conducted by the experts of both sides, in an effort to see whether the material would operate a car satisfactorily; and in three out of the four tests that utterly failed, and in the fourth it succeeded in operating a car, only under the most favorable circumstances, long after midnight, at very low temperature, when the volatility would be at its minimum.

The foregoing is the substance of all the evidence in the case, and it is submitted that the conclusion of the Circuit Court of Appeals was clearly right.

As previously stated, substantially the whole issue on the trial was whether or not the material should properly be called "gasoline", and this was necessarily so because the indictment alleges that the material shipped was gasoline; and proof that it was anything else, regardless of the rates upon which it ought to be shipped, would clearly be a fatal variance.

The Director General, however, in this Court, for the first time attempts to assert a new theory of the case, supported by a disingenuous argument. His position is, in substance, that, assuming the material is not actually gasoline, nevertheless the Interstate Commerce Com-

mission, in its regulations governing the safe transportation of dangerous or explosive articles, has provided a rule which during a portion of the time covered by the indictment provided that the material *may be* shipped as "gasoline" and during the remainder of the time *must be* shipped as "gasoline", "casinghead gasoline" or "casinghead naptha"; that these rules, as required by the Commission, are published by the carriers in their classifications; that these classifications are filed with the Interstate Commerce Commission as tariffs, and that accordingly they become controlling descriptions for rate purposes. In other words, his contention is that, supposing for reasons of safety the Interstate Commerce Commission had promulgated a rule requiring that kerosene *should be* billed and placarded as "gasoline" or *might be* billed and placarded as "gasoline", the publication of such rule by the carriers in their classifications would automatically make applicable the gasoline rate on kerosene, although there might be rates specifically published applicable to kerosene. If the contention had any merit, it is obvious that the indictment would not fit. It would have been necessary to allege that the material shipped was the liquid condensate of casinghead gas below 10 pounds vapor tension; that by reason of the regulation of the Commission the rate applicable thereon was that applicable to gasoline, and that the defendant had paid a lesser rate. But the contention is without merit in any event.

As pointed out in the argument in support of the motions to dismiss or affirm (*pp. 26, 27*), these very same regulations contain another rule requiring that all articles

"must be properly described by the shipper in his shipping order and bill of lading under the specific or general name provided for the description of such freight by the carrier's classification and tariff governing."

The further contention of the Director General, that the efficacy of the safe transportation rules, as such, will be destroyed if the opinion of the Circuit Court of Appeals is not reversed, is utterly without merit, and can scarcely be made with good grace by the Government in the face of the knowledge it possesses that there are still pending untried in the District Court other indictments expressly charging violation of the Safe Transportation Regulations in regard to the same matters herein involved, upon which indictments there will be abundant opportunity to hold the respondent accountable, if these rules have in any wise been violated.

In their efforts to find material to support the contentions which they claim warrant the review of this case by certiorari, the Solicitor General and the Director General in their briefs have given such erroneous, garbled and fragmentary statements of the evidence that it becomes necessary to review it completely under this point of respondent's brief instead of in its normal place.

The facts shown by the evidence are as follows:

Petroleum oil is a mixture of various hydrocarbons. In the process of refining, it is separated into various fractions, the process consisting in the segregation of those hydrocarbons of certain boiling points or gravities which go to make up the respective finished products of petroleum, such as gasoline, naphtha, benzine, kerosene, gas oil, fuel oil, lubricating oil and waxes. The hydrocarbons which are lighter in gravity than those used to make kerosene (being the ones which are used to make gasoline, naphtha, and benzine) are collectively called—both scientifically and commonly—the naphtha fraction of petroleum oil. Naphtha is a generic name, covering finished gasoline, naphtha and benzine, as well as the materials of which they are composed; and it is also a specific name of the narrower subdivision of itself used for making paints, varnish, and for other purposes (*Rec.*, pp. 587-589, 691, 700, 710, 711, 887).

Coincident with the flow of oil from a well, a certain gas comes off, commonly called casinghead gas (*Rec.*, p. 186). This gas contains a quantity of light hydrocarbons identical with the lighter hydrocarbons embraced within the naphtha fraction of petroleum oil, but in vapor form (*Rec.*, p. 887). Whether this gas comes off, and is a part of, petroleum oil, is not known to science; there being two theories: one that it does and is, and the other that the gas comes from other sources, but occupies the same fissures or chambers in the earth that are occupied by the petroleum oil, and consequently escapes with it (*Rec.*, p. 890). It is scientifically known that naphtha gas may and does arise from sources entirely independent of petroleum oil (*Rec.*, p. 691). For many years, this casinghead gas was wasted, although it was recognized that the hydrocarbons contained in it could be utilized in the making of gasoline the same as the similar hydrocarbons contained in petroleum oil (*Rec.*, p. 690).

After considerable experimentation, a satisfactory process was evolved for the capture of these hydrocarbons and their reduction to liquid form by compression of the gas (*Rec.*, p. 690). This led to the erection in the State of Oklahoma by the Gypsy Oil Company (affiliated with the defendant) of what are known as compression casinghead plants, the first constructed beginning in 1913, being rapidly followed by others, until there are now many compression plants (and plants using other processes, not here important) employed in the process mentioned.

The liquid condensate of the gas (quite commonly called "casinghead gasoline") is extremely volatile, and the greater portion of it would, unless confined, very quickly return to a state of vapor (*Rec.*, p. 591). It is not practically usable, nor is it the same, as the commodity commonly known as gasoline used for running motor cars, gasoline launchers, gasoline stoves, etc. It will not run a car satisfactorily (*Rec.*, pp. 695, 698, 884, 886),

and frequently will not run it at all (*Rec.*, pp. 695, 857, 858), and the Government's expert witness testified that he would not trust his wife to attempt to run a car with it unless he was with her (*Rec.*, p. 883) and that it is not suitable for general use by "common people" as distinguished from an expert like himself (*Rec.*, p. 883).

The commodity commonly known as "gasoline" consists of an aggregation of lighter hydrocarbons within a limited range (determined by varying standards prescribed by government regulations, state laws, purchaser's specifications or the individual manufacturer's own specifications, and other conditions), which upon fractional distillation will begin to boil at a certain temperature, certain percentages of which will distill over at certain other temperatures, which will not completely distill over short of a certain maximum temperature, and which will produce a certain minimum recovery after distillation. The most important difference between it and the so-called casinghead gasoline—or liquid condensate of casinghead gas—is that the latter is composed principally of the lighter gravity hydrocarbons only, and does not include sufficient of the heavier hydrocarbons, embraced within the range compassed by gasoline, as a consequence of which its initial boiling point is very much lower than that of gasoline, and its "end point" likewise substantially lower, and the recovery after distillation much less (*Rec.*, pp. 691, 699, 700, 887, 889).

Fractional distillation for the purpose of testing a material consists in running a sample of the material through a small still known as an Engler flask.

The War Department specifications—which are the same as defendant's own standard—require that before material will pass as gasoline it must meet the following specifications:

Upon distillation its initial boiling point shall be at not less than 140 degrees Fahrenheit; not less than 20% must be distilled at 221 degrees; not

less than 45% at 275 degrees; not less than 90% at 356 degrees; and must be completely distilled over—the flask being dry—at 428 degrees; and, of special importance, there must be a recovery of not less than 95% of the material, that is, there must not be a loss upon distillation of more than 5% of the material distilled. In addition to these requirements, it must be free from odor, and must be what is technically known as water-white in color. Water-white color is determined by an instrument known as the Sayboldt Chromometer (*Rec.*, pp. 290-312, 730, 768).

A product substantially identical with the liquid condensate occurs in other ways. In the course of distillation at a refinery, these same lighter hydrocarbons vaporize, and would escape but for the fact that they are recaptured and put through a compression plant and liquefied; this condensate being called “still gas gasoline.” This is, of course, likewise not a completed marketable gasoline, but is run on through other processes and blended into gasoline materials (*Rec.*, pp. 700-1, 838, 841-2). Again, a like vapor arises in large crude oil tanks on tank farms, and it is sometimes captured and condensed. Aside from this, there is a product substantially similar, but not identical, which is variously known as “lighter ends”, “tops”, “skimming”, and perhaps other names, consisting in naphtha hydrocarbons driven off crude oil by the application of heat in what are known as “skimming” or “topping plants”. These tops while within the range of the naphtha fraction contain a somewhat larger percentage of the heavier hydrocarbons embraced therein than does the liquid condensate of casing-head gas. Topping is practically a crude initial step in refining by a plant not equipped to go further in the processes of refining, which generally sells or ships the tops to a refiner, where they are further processed in the making of gasoline (*Rec.*, pp. 592-3, 615-618, 693).

The liquid condensate is not sold for use as or in place of gasoline; but, so far as it is dealt in commercially, is sold to refiners or others, to be used by blending with heavier hydrocarbon of the naphtha fraction, and to thus produce gasoline (*Rec.*, pp. 693, 854-5). While the liquid condensate in the state in which it comes from the compressors can be shipped in specially constructed insulated tank cars, the general practice is to reduce its vapor tension to not exceeding 10 pounds per square inch, either by a process known as "weathering" (consisting simply in allowing the more volatile portions to escape), or by a process known as "blending" (which consists in the addition of crude naphtha or some other heavier petroleum distillate), or both weathering and blending to such extent as will reduce the vapor pressure to 10 pounds and act as a sort of carrier or sponge to prevent loss by escape of the gas, and at that pressure it is shipped in ordinary tank cars (*Rec.*, pp. 194-196, 202-204, 213, 214, 237, 591, 859-60). This blend of liquid condensate and naphtha is more nearly identical in the range of hydrocarbons embraced within the tops above described than is the unblended liquid condensate (*Rec.*, p. 693). It is possible, however, to blend the liquid condensate with a sufficient additional quantity of naphtha to make a product somewhat similar to refinery-made gasoline, and this is done to some extent, and the product sold as gasoline (*Rec.*, pp. 695, 743-6).

In the beginning, the Gypsy Oil Company tried this method, and the defendant sold the product as "blended gasoline" (*Rec.*, pp. 555, 556). On account, however, of excessive loss and the unsatisfactory results of the use of this material and because the sale of it was injuring the reputation of its standard refinery-made gasoline, the company soon discontinued any effort at the casinghead plants to so blend the liquid condensate as to make a product salable as gasoline, and, instead, began shipping the liquid condensate blended sufficiently only to reduce

its vapor tension to 10 pounds (or weathered to that point) to its Porth Arthur refinery. The product has ever since at this refinery been expertly blended with and into other materials in such quantities and under such conditions as to produce a product meeting the requirements of commercial gasoline (*Rec.*, pp. 678-680). In some cases this was not possible and the material was distilled.

Blending is one of the processes of the art of refining petroleum oils applied not only to gasoline, but lubricating oils and other products, and is a delicate and expert operation (*Rec.*, pp. 689, 690, 691, 743-7). Sometimes the liquid condensate when it arrives at Port Arthur is found to be "off color" or to contain a deleterious quantity of sulphur; in either of these cases it is necessary to subject it to other processes, wherein it becomes simply mingled with and loses its identity in other materials undergoing such processes in the regular course of manufacture of gasoline by the refinery (*Rec.*, pp. 255-6, 860). If, however, it is free from these objectionable features, as is most commonly the case, it is possible to blend it with and into gasoline with a recovery in excess of 95%, purposely so made at the refinery in order to be able to accommodate the injection into it of quantities of the liquid condensate running from 5% to 25% of the whole. The operation of blending is performed either in tanks, or in ships' holds so constructed as to permit of the operation. It consists in the mixing, by a man of long experience guided by the distillation tests, of such quantities of the two materials as will meet the specifications. After they have been combined, a distillation test is made to ascertain whether the operation has resulted in producing a material meeting the specifications, and, if not, in what respect the blend is deficient. Naturally the operation rarely produces the required result on the first attempt, and it is usually necessary to add more of one or the other of the materials and again test; and to continue

the operation of adding and testing after each addition until the specifications are met. Ordinarily it takes about three attempts before success (*Rec.*, pp. 254-60, 312-23, 582-602).

A very small quantity of the liquid condensate (blended to 10 lbs. vapor pressure) was also shipped to a blending plant owned by the defendant at Pittsburgh, Penna., where it was utilized by blending it with other material obtained at that point from other sources.

The "blended gasoline" which was shipped commercially in the earlier years was described and shipped as "gasoline"; and it is conceded by the defendant that that word was and can still be applied to this material without impropriety. When the material which was shipped to Port Arthur, however, first began moving, it also was shipped and described as "gasoline," there being no classification or commodity rating expressly covering it, and gasoline being the nearest analogous classification thereto.

Inasmuch as the material being shipped to Port Arthur was in an unfinished state—and being sent there for the purpose of undergoing further refining process—the defendant besought the carriers to lower their gasoline rates between the points involved or establish what is commonly known as a "milling-in-transit" basis to cover the movement, such as is commonly established by carriers to cover partially manufactured articles stopped to be finished in transit. But the carriers were unwilling to establish that basis (*Rec.*, pp. 559-566).

On May 7, 1912, the Interstate Commerce Commission rendered its decision and report in a case then pending before it, entitled *National Refining Company v. Missouri, Kansas & Texas Railway Company, et al.*, (23 I. C. C. 527). That case sought a determination as to the rate properly to be applied on tops or lighter ends shipped from a skimming plant at Muskogee, Oklahoma, to a refinery at Coffeyville, Kansas. The report of the

case shows that the carriers had but two rates: one applicable to crude oil, and the other applicable to refined products of petroleum oil; the second being substantially higher than the first. The controversy was as to which of those rates was applicable. The Commission found that the material "was not what is commercially understood as a refined product of petroleum oil," and that the refined rate was not applicable and would be unreasonably high; and it prescribed as a basis to cover the unfinished product an intermediate rate based on a differential 2c per 100 pounds higher than the crude oil rate. In the course of its opinion the Commission observed the fact that there was no tradè name or commercial designation for the commodity, and directed the carriers to establish the new rates, giving the material involved such description as would not lend itself to misunderstanding or afford opportunities for misbilling (*Gov. Exhibit 99, Rec., pp. 1378-83*). In compliance with the order of the Commission in that case, the carriers established the rate on the basis ordered, giving the commodity the name "Unrefined Naphtha" (*Rec., pp. 567-574*). This defendant was in no wise interested in, nor had anything to do with, that case.

Following the establishment of this description and rates, the carriers in 1916 established rates on the same basis, *i. e.*, a differential 2c over the crude oil rate from Carterco, Oklahoma, to Baton Rouge, Louisiana, to cover a movement of tops between those points from the plant of the Carter Oil Company, using the description "Unfinished Naphtha" (*Rec., pp. 615, 618*). Upon the publication of these rates in this contiguous territory, the defendant requested the carrier to establish rates upon the same basis and description to cover its traffic between its shipping points. The carriers were requested to publish them northbound from Port Arthur (and Fort Worth, not here involved) to Kiefer to cover the blending naphtha shipped north, and southbound from Kiefer

to Port Arthur, covering the liquid condensate unblended, or blended only to the extent necessary to meet the shipping requirements and serve as a carrier of the liquid condensate (*Rec.*, pp. 559-566, 567-574).

After the usual delay incident to such matter, the carriers published their tariffs on the differential basis sought, effective December 2, 1916. In doing so, however, they used the description "Unfinished Naphtha" northbound and "Unrefined Naphtha" southbound (*Rec.*, pp. 559-566, 567-574). This difference was not made at defendant's request, and is an unimportant distinction (*Gov. Exhibit 98, Rec.*, pp. 694, 695, 1377). It was testified by all the defendant's expert witnesses that the name "unrefined naphtha" was a strictly appropriate technical description of the material shipped southbound, and which is the subject of this indictment, and it was even conceded by the Government's own expert witnesses that the material involved is properly embraced within the generic name "naphtha," and it was admitted by them that it was in an unfinished state, requiring correction of its boiling points before it would become the material known and sold as "gasoline" (*Rec.*, pp. 885, 886, 888, 889). The carriers at the time made no effort to ascertain the exact technical character of the material; the considerations moving them being that it was an unfinished material, and unfinished materials, under ordinary custom with them, being accorded lower rates than the unfinished product, and the fact that the Interstate Commerce Commission had established the 2c differential basis in the *National Refining Company case*, and that they had followed that basis on the Carterco-Baton Rouge movement (*Rec.*, pp. 567-574). The Gypsy Oil Company notified the agent of the initial carrier that as soon as the tariffs became effective they would begin shipping the material theretofore described as "gasoline" under the description "unrefined naphtha" at the new rates; and this was done (*Rec.*, pp. 550-557). The shipping

orders all bore upon their face a stamp indicating that there had been applied to the car a caution card required and permitted (by certain regulations of the Interstate Commerce Commission affecting safe transportation of explosive and inflammable articles) to be placed only upon cars containing this material (*Rec.*, p. 230). It continued to be shipped upon this description and the rate applicable thereto for over two years, when agents of the Bureau of Criminal Prosecution of the Interstate Commerce Commission, conceiving that "gasoline" was a more appropriate description of the material than "unrefined naphtha" caused this prosecution to be instituted.

Doubtless upon the foregoing statement—every particle of which is supported by undisputed evidence—this court is curious as to why such a prosecution should have been instituted, in the first instance, and, in the second, how a conviction could have resulted. We can but speculate upon the answer; as to the first, that at the time the representatives of the Commission determined upon a prosecution, they were laboring under mistakes both of fact and of law. We say this as to the facts, because of a determined effort upon the part of the Government at the trial to prove that the material was not in fact blended at Port Arthur, but marketed as "gasoline," failing to prove which on the trial it shifted to a contention that blending is not a process of refining; in each of which respects the evidence clearly refutes these ideas (*Rec.*, pp. 588-91). And as to the law, because of the erroneous interpretation thereof which they were then urging upon the Supreme Court in the *Lehigh Coal & Navigation* case (250 U. S. 556). And we think the conviction was possible only by reason of the improper admission and rejection of evidence and procedure assigned as error and hereinafter considered.

Upon the trial the Government made no effort in its direct case to prove by direct evidence that the material

in question was and in fact is gasoline. Instead, its proof consisted, first, in showing (on the theory of admissions) the fact (conceded by defendant) that previous to the establishment of the unrefined naphtha rates and also upon the shipments to Pittsburgh (to which point no unrefined naphtha rates were ever established) the material had been described as "gasoline." Included in this showing were those shipments during the early years of operation which were blended sufficiently to be sold commercially as "blended gasoline," and which the defendant conceded ought to have been, and was, shipped upon the gasoline rates. This evidence was all received over the earnest objection of defendant as to its admissibility on the ground that they did not constitute admissions, because the circumstances were vitally different in the most material respects, namely, that in the one case the material shipped was entirely different, and, in the other case, that there were no unrefined naphtha rates which could have been used. The second class of evidence offered by the Government consisted in the testimony of employees of casinghead plants not owned by defendant to the effect that they were accustomed to calling and shipping as "gasoline" the material produced at their plants; this (1) without any showing that the material shipped by them was similar in the degree of blend (a distinction which the defendant insists would be absolutely determinative of whether the material ought or ought not to be called "gasoline"); and, (2) in some cases, with a showing that the material was in fact of a different blend (even to such extent as that it ought to be called "gasoline"); and, (3) without any showing that there were any unrefined naphtha rates available; and, (4) in some cases, a showing that there were not any such rates available. This evidence was likewise admitted over the protest of the defendant. The third class of evidence (directed to the discrimination counts) offered by the Government consisted in evidence of shipments from casing-

head plants located at Jenks, Oklahoma, to Port Arthur, Texas, alleged to be of similar material to the Texas Company billed and described by the shippers as "gasoline," and upon which the Texas Company paid rates applicable to gasoline. The court declined to allow the defendant to show with respect to this evidence that the Texas Company had thereafter instituted suit then and now pending in the United States District Court in another jurisdiction, for the recovery of the difference between the unrefined naphtha rate and the gasoline rate upon the ground that the latter had been improperly applied. The fourth class of evidence consisted in a showing by the Government of certain lead pencil records in books kept by laboratory boys at Port Arthur, in which they had, up to about April, 1917, entered a record of tests of the material, describing it in some instances as "Kiefer Gasoline," in some instances as "Kiefer Gas," and in others as "Kiefer," which descriptions had been erased, down to the time in April, 1917, when they began to use the description (in these books) "Unrefined Naphtha." Also certain carbon copies of statements kept at the refinery, the originals of which were transmitted to the general office at Pittsburgh, upon which headings reading "Receipts of Kiefer Gasoline" had been cut off, for the months preceding June, 1917, subsequent to which these headings read "Unrefined Naphtha". This evidence was offered and permitted by the court to be introduced upon the theory of establishing intent. There was no showing as to when, where or by whom the erasures were made, other than that it was admitted by the defendant that they existed at the time the books were turned over to the Government upon the grand jury inquiry, nor any showing of when, where or by whom the headings of the statements had been cut off. But it was established that instructions had been given to all employees at the refinery, upon the establishment of the un-

refined naphtha rates, to thereafter so describe the material, and it was further shown that it was no part of the duty of the boys who made these entries to attempt to classify or describe the material, but simply to record the indicia of the physical tests of it, and it was also shown, as to the statements the headings upon which had been cut off the carbon copy remaining at the refinery, that the originals which were the actual record and on file in the main office at Pittsburgh were not mutilated, but bore the original headings. These statements were merely rendered for the purpose of intercompany accounting, having nothing to do with any classification of the material, and there was no showing whatever that the erasures or deletion were made by, at the instance, or with the knowledge or consent, of any person connected with the corporation within the scope of whose authority or employment freight rates or charges were in any wise concerned. The defendant, of course, objected strenuously to the introduction of this evidence upon the ground that it was not competent to show intent, and the further ground that evidence of intent was not admissible at the time on account of the *corpus delicti* not having been established by any competent evidence, under which circumstances its admission was highly prejudicial (*Rec.*, pp. 290, 300).

To meet this case the defendant called six expert witnesses, some of them preeminent, upon the subject of the proper description of the material. They were, Colonel George A. Burrell, a man presently president of one refining corporation and general manager of another, neither in any way affiliated with the defendant, a consulting petroleum engineer, with the degree of Chemical Engineer and of Doctor of Science, who served for ten years in the Government Bureau of Mines, during four of which he was expressly engaged upon the study and investigation of this very gas and its recovery. During the World War, he entered the army and had complete charge of the Research Division of the Chemical War-

fare Service, having over 1500 of the most eminent technical men and scientists in the country engaged in such research under his direction; he was awarded a Distinguished Service Medal for this work. The Bureau of Mines, during his service with it, published and disseminated a bulletin prepared by him upon the subject of this industry, which is one of the exhibits in this case. He is also the author of a book on Gasoline, of technical papers upon the subject, the first man successfully to analyze the constituents of casinghead gas, and a man universally recognized as a preeminent authority on the subject. He was in no respect interested (*Rec.*, p. 689). He testified that blending is a delicate expert art of refining, including the blending of this material (*Rec.*, pp. 689-691, 704, 705); that the name "naphtha" in a strict technical sense defines the light distillates from crude oil down to kerosene, and that it is also the specific name of that subdivision of itself within certain gravities used for blending, which is also known as "painters' and varnish makers' naphtha" (*Rec.*, p. 691). He defined "gasoline" as a mixture of hydrocarbons suitable for use in vaporizers, that is, such as motor cars, gasoline stoves, launches and lighting machines (*Rec.*, pp. 691, 692). He testified further that there is great confusion in the nomenclature of the petroleum industry; that the material shipped by the Carter Oil Company from Carterco to Baton Rouge, known as "toppings", was a naphtha fraction, and that it was essentially similar to the product shipped to the defendant and utilized in the same way, namely, to make gasoline (*Rec.*, p. 692, 693); that he himself sometimes called this material "gasoline", although he knew that that was not the proper name for it; that he even used that name in one of his bulletins published by the Bureau of Mines, but that he was very careful at the end of the book to state that that was not the proper name, that the material was not in fact gasoline, and that it could not be placed in that category until

properly prepared for market, and this bulletin was written in 1914 and published in 1915, long before any of the incidents the subject of this indictment occurred (*Rec.*, p. 694); that "unrefined naphtha" is an entirely appropriate and accurate name, although he would have chosen "unfinished naphtha" in preference to "unrefined naphtha", but that one is as appropriate as the other (*Rec.*, pp. 694, 695); that it is possible to blend the raw casing-head condensate to such an extent further than that to which the material here involved was blended, as would produce a product which could be used as gasoline, but that the product shipped to defendant—either the blended or the raw—was not usable to run a car; that he had taken samples of the material and made distillation tests upon it in order to be sure that it was of the same character as that shipped, and had tried it in both a Packard car and a Dodge car on the eve of the trial, and found that it absolutely would not run the cars, and that this was the result he expected by reason of his years of experience in the investigation and handling of the material, and that even during those years he had made experiments in attempting to use the material in a car, and found that it was necessary to "weather" it away until over 80% of it was lost, using only the 20% remaining to accomplish the purpose, which of course was not the same material as that shipped (*Rec.*, pp. 695-699). He had had applications from other refiners to purchase the lighter ends of his topping plant, then under construction at New Orleans, and some of the applicants had called for the material under the name "unfinished naphtha" and other under the name "unrefined naphtha" (*Rec.*, p. 699); that the material shipped to defendant could in no proper sense of the word be called "gasoline"; that it is all too volatile in character, vaporizes too readily, and has a loss on distillation around 15%, whereas any material to be reasonably regarded as gasoline should not have a loss over 5% (*Rec.*, pp. 699, 700, 702);

that the scientific literature on the subject of naphtha used the name as applying to the lighter ends of crude oil above kerosene, as a generic term (*Rec.*, p. 700); that so-called still-gas gasoline arising in a refinery is condensed, and handled and treated exactly the same as the liquid condensate of casinghead plants, and blended with heavier distillate in the same way that the material shipped is (*Rec.*, pp. 700, 701); that the casinghead condensate occupies a reciprocal relation to the heavier naphtha, in that by their being blended together both are made usable and more useful (*Rec.*, p. 701).

During the trial Colonel Burrell conducted a joint demonstration with the Government's experts, two cars being used, the defendant selecting a Packard car and the Government selecting a Pierce-Arrow car. They first filled the cars with the unblended liquid condensate, and attempted to drive from the town of Jenks to the town of Kiefer, a distance of about 12 miles, over a flat, non-hilly country, and under atmospheric conditions favorable to the use of the material. They started with the machines cold and in every way favorable to the material. The witness was in the Packard car, which ran about three-fourths of the way to Kiefer, where it stopped absolutely dead, and no amount of adjustment or persuasion could make it go. On the few light grades encountered the car lacked power; it puffed and wheezed and acted quite unnaturally, and it finally became necessary to abandon the car through inability to proceed further, after the Government's representative was given every opportunity to do anything he could to make it go (*Rec.*, pp. 797, 798). They then tried the blended material, blended to the same extent as that shipped to Port Arthur, and attempted to run from Kiefer to Tulsa. They had so much difficulty in attempting to start the car that they were about to abandon it. He testified that he never witnessed a more unsatisfactory performance of a motor car. The road was

hilly, and the car did everything that a car with a good grade of gasoline should not do; it had no power on the hills, none of which were extraordinary, and on some it would creep to the top at a speed of 2 miles per hour on low, and on the level stretches there was no speed of consequence, and it behaved abominably. They finally got to within two or three miles of Tulsa, and it again came to a dead stop. After doing their utmost to start the car, it being then two o'clock in the morning, it was finally found necessary to abandon the test and fill the car with real gasoline. They were between two and a half and three hours trying to run 12 miles. There was nothing the matter with the car, and as soon as the real gasoline was put in it had no difficulty whatever in running. On this test the atmospheric conditions were still more favorable. In the opinion of the witness, the material used would not have run the car as little as it did under less favorable conditions. The cars were public hired cars, driven by their regular drivers. Every thing was done under the immediate observation of, and every opportunity afforded, the Government experts to try to make it operate (*Rec.*, pp. 798-800).

The Government made no attempt to put on the stand any of its witnesses who accompanied the Packard car on this test, but, in order to excuse doing so, waived their previous claim that one of the witnesses they sent for the express purpose of witnessing the test was an expert (*Rec.*, p. 804).

Dr. James B. Garner followed Colonel Burrell as an expert for the defendant. He is a chemical engineer and since 1915 has been Senior Fellow of the Mellon Institute of Industrial Research (University of Pittsburgh) in charge of the Natural Gas Investigation; has been engaged since 1897 in teaching chemistry and doing consulting industrial chemical work; has made a special study of and been engaged upon research in connection with casinghead gas; is thoroughly familiar with the

scientific literature on the subject (*Rec.*, pp. 708-710). It defines naphtha, in its generic application, as that liquid distillate derived from crude petroleum, lower in boiling point than ordinary kerosene, and in its specific application as that subdivision of the naphtha fraction known as painters' naphtha or solvent naphtha. He defined gasoline in its proper technical sense as the low boiling portion of naphtha having a gravity of 76 to 82, and usable for vaporization purposes; that as a commercial term or article of commerce it is a finished product as distinguished from an unfinished product, and that nothing could be properly called gasoline which could not be used for vaporization purposes, such as running a car or gasoline stove; that he is familiar with the product shipped to defendant, and that it was in no proper sense of the word gasoline; further, that the term "unrefined naphtha" is not only an appropriate description but a very accurate description of the product (*Rec.*, pp. 710, 711). He participated in the tests made on the eve of the trial, as to which Colonel Burrell testified, and corroborated Colonel Burrell's testimony. He testified that 96% of all the materials used and called "gasoline" is used in internal combustion engines with suction carburetors; that the material called "cracked gasoline" is not gasoline at all, because it is an unrefined material; that, dependent upon its characteristics, it might be unrefined naphtha (*Rec.*, p. 712); that casinghead gasoline of the same gravity as gasoline would still not be gasoline, but fundamentally different, which would be demonstrated by plotting curves of the distillation tests of the two materials; that they vary in the relative amounts of pentane, hexane, heptane, octane, nonane, propane, butane and isobutane (*Rec.*, pp. 713, 714). He produced a chart (*Deft's. Ex. 149*) showing the difference in curves upon distillation tests even as between Jenks and Kiefer material. He testified that casinghead gasoline is not refined because it is not fit

for use as gasoline in the broad sense of the public understanding of the word "gasoline" (*Rec.*, p. 715). He made distillation tests of the material used in the experiments conducted jointly with Government experts, and gave it as his opinion that the material was unrefined naphtha and not gasoline (*Rec.*, pp. 843-846). He also accompanied Colonel Burrell in the Packard car in which the joint test was made, and testified that when the car went "dead" between Jenks and Kiefer they got some material called drip, being a heavier material, and tried mixing it in an effort to start the car, which it still would not do, although more of the material was added. He gave it as his opinion, based upon his knowledge of the literature on the subject and his experience, that the reason the material shipped was called "casinghead gasoline" was that it took the name "casinghead" from the fact of its being derived from the casinghead of an oil well, and the name "gasoline" because it could be made into gasoline (*Rec.*, p. 848). So far as the material used in the test operated at all, the car consumed about a gallon to four miles, more than double the reasonable consumption of gasoline (*Rec.*, p. 849). Even if the material would run a Pierce-Arrow car, that would not indicate that the material was gasoline, partly because of the construction of a Pierce-Arrow car, and for the further reason that he had known crude oil to actually run a car (*Rec.*, pp. 850, 851).

The next expert called by the defendant was Dr. Eugene Paul Schock, a professor, and chairman of the School of Chemistry and Chemical Engineering and head of the Division of Chemistry of the Bureau of Economic Geology of the University of Texas, with which he has been connected since 1897. The chief study of chemical engineering in the University is technology of petroleum, on account of the fact that petroleum ranks foremost in the chemical industries of the state, and the University's policy is to give special aid to

state industries; they not only have a laboratory, but they also have a small refinery. He is a member of many technical societies, and one of the prime requisites of his work is to keep abreast of current technical literature on the subject of petroleum. He is the author of a score of papers on scientific subjects. His research work embraces the casinghead industry (*Rec.*, pp. 717, 718). He testified that the name "gasoline" has always been applied to material suitable for vaporizing. Although the material now called gasoline would have been called naphtha twenty years ago, yet it has always been a material suitable for vaporization, such as stoves, automobiles, gasoline torches used by plumbers, and so on (*Rec.*, pp. 718-720). He pointed out why it is necessary that a material to vaporize properly must be composed of certain proportions as distinguished from any mixture of the constituents (*Rec.*, p. 720). He testified that "naphtha" is the proper technical name to cover collectively the lighter portions of crude oil; that gasoline is a naphtha of certain properties embraced within the term "naphtha"; that name is a proper name for any gasoline, but all naphthas are not necessarily gasoline (*Rec.*, pp. 720, 721). He is familiar with the material shipped to Port Arthur, and that it is not gasoline; that the name "unrefined naphtha" appropriately describes it (*Rec.*, p. 721). He participated with Colonel Burrell and Dr. Garner in the distillation tests, and also in the test made by the defendant's experts on the eve of the trial. He knows from the distillation tests that the material used was the same as that shipped (*Rec.*, p. 721). He corroborated the testimony of both Colonel Burrell and Dr. Garner that the material absolutely would not run either the Packard or the Dodge car upon which it was tried (*Rec.*, p. 722). The court refused to allow the defendant to introduce by him a statute of Texas which absolutely prohibits and makes criminal the calling of this material either gasoline,

or gasoline in combination with any other word—which would of course include casinghead gasoline (*Rec.*, pp. 720-727). This witness also qualified as an expert in the art of refining. He testified that blending is an essential operation in the production of at least two, and probably more, commodities obtained from a petroleum refinery; that it is an essential operation in refining gasoline, including the utilization of still gas, casinghead gas, and cracked material (*Rec.*, p. 727); that the proportions of the more volatile to less volatile in gasoline is a very important and very intricate matter; that the way it is done is, that, being governed by the materials on hand, a mixture is made by guess, then a distillation and such other tests as are necessary made of the mixture to determine when it has fulfilled requirements (*Rec.*, p. 728); that the term “unrefined naphtha” comprehends more than the material shipped, and is not limited to it alone, but embraces tops from a topping plant, or light-end distillate (*Rec.*, p. 728). He gave specifications of material which would be gasoline, as determined by fractional distillation, the same as the War Department specifications (*Rec.*, p. 730). Instead of having an initial boiling point of 140 degrees, as it should have had, the material tested began to distill at 85 degrees and its end point was 400 degrees (*Rec.*, p. 732).

The defendant next called as an expert Mr. Walter Miller, a petroleum refiner and consulting engineer with reference to petroleum refining, of Tulsa, Oklahoma. Before coming to Oklahoma he had been employed by the Tide Water Oil Company at Bayonne, New Jersey, where among his duties were experimental and research work and charge of the gasoline and kerosene department, and at the time of leaving was a member of the Manufacturing Committee, chairman of the Investigation and Research Committee, chairman of the Process-

ing Committee, assistant to the superintendent in charge of all processing work in the refinery, etc. Following that, he was general superintendent of the refineries of the Pierce Oil Corporation located in the United States. He then became manager of the Manufacturing Department and in complete charge of all the refining operations of Cosden & Company, and is still connected with that company in a consulting capacity. In connection with his work he has studied technical works, both upon chemistry and civil and mechanical engineering applied to refining and the technology of petroleum refining generally, and in the course of his work has had many opportunities to visit the plants and meet other refiners and discuss evolution of the business. He is a member of several technical societies (*Rec.*, pp. 735, 736). It has been a part of his duty in connection with his employments to decide what names should be applied to different products and apply names to new products or new divisions of old products. He has handled millions of gallons of casinghead products, and he is familiar with the analogous condensate produced from still gas. He has built compression plants in refineries for the recovery of still gas (*Rec.*, pp. 735, 736). He testified that the material shipped is not finished gasoline (*Rec.*, p. 737); that it is practically the same and goes to the same use as the still-gas condensate, which also has to be blended or weathered or redistilled in some manner the same as the casinghead condensate does (*Rec.*, pp. 737, 738). The casinghead condensate is not gasoline and not suitable for gasoline. He defined gasoline as that fraction of crude petroleum or similar products lying within the range of boiling points and other necessary physical tests which will satisfactorily and economically operate an internal combustion motor. This material will not do that. It is necessary to apply further processes to it before it will. These processes are generally

done in a refinery by blending with products of crude oil in such a manner and such proportions as to bring the material to the point where it will operate an internal combustion motor satisfactorily and economically (*Rec.*, p. 738). That is the most economical method of doing it. It can be brought to a stage where it will operate by excessive weathering or distillation; and it is sometimes necessary to treat it with acids or filter it through fuller's earth, after which it is still necessary to blend it (*Rec.*, pp. 738, 739). To weather it to such point to make it reasonably usable would result in a loss of all but 25% to 40% of the product. It is his practice with respect to blending to use 3% to 5% of casinghead condensate with other materials; this in order to procure a proper recovery and proper range of boiling points and intermediate curve points and to prevent excessive loss by evaporation (*Rec.*, p. 739). Few if any other refiners go above 10% of casinghead content (*Rec.*, p. 740). Naptha, as used in the refining business, he defines as a generic term applicable to that fraction obtained by the distillation of crude oil before the product kerosene is reached, and specifically as covering the heavier blending materials which are used in compression plants. It was the custom of the Tide Water Oil Company to call the material, both in process of manufacture and when completed, naptha, even including the material commonly called gasoline which was sold by them under the name "naptha". This is a very old concern and always used that term (*Rec.*, pp. 740, 741). The blending done by defendant at Port Arthur is a process of refining; that the name "unrefined naptha" is a proper designation of the material shipped to Port Arthur, although he might prefer to call it "unfinished naptha" or "unfinished gasoline blend", or "unfinished casinghead blend", or "unrefined casinghead blend". The term "unrefined naptha" embraces not only this ma-

terial but any naptha product which has not been completely refined ready for use, including tops and light-end distillate, and is a more appropriate name for those materials than tops and light-end distillate (*Rec.*, p. 741). It would not be practicable in this day and age for a refinery producing gasoline to operate successfully without resorting to blending as a part of its process. There is great confusion among refiners in the use of names of products, which includes applying the names of finished products to the materials ultimately to become such products (*Rec.*, pp. 741, 742). Blending at a refinery is a sort of compounding. He has known of casinghead plants which attempted to blend in the field and sell the product as a finished product, but had found it unsatisfactory. The blending which is done at a casinghead plant is a much simpler operation than the blending done at a refinery. The only object at the plant being to reduce the vapor tension to the shippable degree, whereas in the refinery the object is to reduce not only the vapor tension but other undesirable characteristics to such an extent as to make a product for use in automobile motors (*Rec.*, p. 743). It is not practicable to blend at a casinghead plant in order to make a finished marketable product, because it would require not only the heavy naptha used to blend for shipping purposes but also a large portion of the straight run products from crude oil to give a satisfactory distillation test and performance. A satisfactory blend is one where the casinghead is held down to not over 5%, and that would mean that the casinghead plant would have to have 90% to 95% of other products available, which would be obviously impracticable and uneconomical, as otherwise it would be necessary to locate the refinery at the casinghead plant, and as wells were exhausted move the refinery around from time to time (*Rec.*, p. 746). There is a much higher degree of skill and knowledge incident

to the blending done at a refinery than that done at a casinghead plant. Blending at a casinghead plant merely consists in blending sufficient to reduce the vapor tension, whereas in a refinery it includes the problem of blending for different percentages off on distillation tests, for the end point, for the initial, for the gravity, and anywhere from 5 to 14 points, and requires considerable experience and an intimate knowledge of the product being blended, and the proportions are usually determined by skilled chemists or men with long experience in the refining business (*Rec.*, p. 747).

The next expert called by the defendant was Dr. R. F. Bacon, Director of the Department of Industrial Research of the Mellon Institute of Pittsburgh (University of Pittsburgh) since 1914; a doctor of chemistry, and with two honorary doctor degrees; was connected with the Government for six years, and has been with the University of Pittsburgh since 1911, engaged in the study of petroleum. He is the author of a number of technical papers on the subject of petroleum, and co-author with Mr. Hammer of an important and comprehensive two-volume work entitled "American Petroleum Industry." He was a colonel on General Pershing's staff in France, and had charge of all the chemical work of our army in France up to the time of the armistice. He is a member of any number of technical societies, including international societies of the greatest importance. He was cited by General Pershing for his work in France. He is the author of numerous papers and scientific journals, and the holder of a number of patents in the field of chemical industry. His business and study necessarily keeps him abreast of the scientific literature relating to the subject of the petroleum industry (*Rec.*, pp. 748-750). He has made a large number of tests, both physical and chemical, and is familiar with the material shipped to Port Arthur. His definition of gasoline is

that it is a finished product that will satisfactorily run a motor car (*Rec.*, p. 750); that while there was considerable confusion in names and a practice general among refiners of calling unfinished material by the name applicable to the finished product, the name "gasoline" could not properly be applied to anything but a finished product such as would satisfactorily run a car (*Rec.*, pp. 749-752). In the Mellon Institute they have a machine for testing materials by their performance in a gasoline engine; and the witness has made many tests. With each such performance test they make a distillation test, and plot the curves, and it is by this means they know the curve of a material which is a satisfactory gasoline. They are thus able to determine by the distillation test of a material whether or not it is a satisfactory gasoline. In other words, the curves are an index to performance (*Rec.*, pp. 758, 759). He has tested casinghead gasoline and found it would not run an engine at all. Sometimes he would find one that would run in a very unsatisfactory manner. It would deliver little power, and the consumption would be very high, and it would spit and miss fire (*Rec.*, p. 760). It is possible by means of these curves to tell whether or not it is a material that will not run a car. There is a point in between as to which it will be difficult to say, but it is possible to tell whether a material will run a car in a satisfactory manner (*Rec.*, p. 760). A material that will perform satisfactorily as gasoline must have a comparatively small amount of volatile constituents and a moderate amount of intermediate and end constituents. Exhibit 140 shows two curves, one of which will not operate at all and the other very poorly (*Rec.*, pp. 761, 762). These curves were made from distillation tests of the material shipped from Kiefer and Jenks.

Dr. Bacon also participated with Colonel Burrell, Dr. Garner and Dr. Schock in the experiment that was

made by the defense experts on the eve of the trial. The distillation tests indicated that the material was not a usable gasoline. His observation of the experiment was the same as that testified to by the other witnesses, that is, that the cars refused to perform altogether (*Rec.*, pp. 762-764). The material is not gasoline. The name "unrefined naphtha" is a proper designation, although not the most descriptive one he could think of. That name comprehends more than casinghead, and is a broad term. It comprehends any naphtha that has not been brought to a finished state. Naphtha, as applied to the petroleum business, is a term covering any low boiling point product of petroleum which boils below the kerosene oil fraction. It would embrace gasoline (*Rec.*, p. 764). There is no question that blending as applied to gasoline is a part of the art of refining, and that it has greatly increased the available supply of gasoline by making usable for the purpose of manufacturing gasoline a much wider cut of naphtha than could otherwise be used (*Rec.*, pp. 764, 765). It has also made a market for the casinghead product, for which there would otherwise be little or no market (*Rec.*, p. 765). Casinghead could be weathered down to a point where it would run a motor car in a very satisfactory way, but the loss would be very large, and it would not be profitable (*Rec.*, p. 765). The blending of naphtha and casinghead does not necessarily make gasoline. If it is blended in such a way as to meet specifications, or in such a way as to run a motor car, it may be gasoline; if not, it is not (*Rec.*, pp. 768, 769). The word "casinghead-gasoline" is a compound word, and the material is different from the type of material commonly called "gasoline." A material is not refined until it reaches or is brought up to a standard. As an illustration, sulphur, although it may be 99.7% pure, is still crude sulphur, and is sold and shipped as such because it does not meet the standard for refined sulphur.

Copper, although 99% pure, is sold as base or ana copper; the question of whether it is refined or unrefined being determined by market standard (*Rec.*, pp. 770, 771). "Casinghead-gasoline" is a compound word, and the inclusion of gasoline in it no more imports gasoline than does German-silver silver, or quicksilver silver, or isinglass glass (*Rec.*, pp. 770, 771).

This witness also participated in the joint test that was made with Government experts during the course of the trial, he being in the Pierce-Arrow car. The car was cold when it started, and it ran apparently satisfactorily the first six or seven miles, then the engine began to have trouble; first it began to lack power, began to miss, and was evidently in trouble, and this trouble continued until about eight miles had been traveled, when the car stopped and the driver could not start it. It took twelve minutes before they were able to get the car started again, and during the first half mile the engine was still in trouble, threatening to stop, then picked up and ran very well until it got to within a hundred yards of Kiefer, when it stopped again, and it took five minutes to get it started again. With the Kiefer material in the Pierce-Arrow car, it was able to run all the way to Tulsa without stopping, and while it ran fairly satisfactorily, it popped a few times, and there was one hill in particular on which it performed badly, almost stopping, the driver having to throw it into second, going only six or seven miles an hour until it got to the top of the hill|. It was necessary for the driver to manipulate the air. The witness has seen crude oil operate a car more satisfactorily than this material did (*Rec.*, pp. 804, 805). The temperature was 54 when they left Kiefer and 46 when they got to Tulsa, and in the opinion of the witness it was due to this difference in temperature alone that it was possible to run the car as much as was done, and that the results would probably have been similar to what they were on the first test had the

atmospheric conditions been the same. After the joint test, the witness was positive the material was not gasoline.

All of the foregoing experts were in no way connected with the defendant.

In addition, the defendant called Mr. George H. Taber as an expert. He is vice-president in charge of the refineries and all manufacturing of the defendant. He has been engaged in the petroleum business since 1882, having been superintendent of the plants of several other companies before coming to the defendant in 1893. He had charge of the construction of the casinghead plants from the beginning, and also of operation (*Rec.*, pp. 667, 668). During the 38 years of his experience, he has given particular attention to a study of the nomenclature of the industry, which interested him more than any other part of the business. In his earliest employment it was a part of his duty to review the nomenclature used, and he originated much of it. With other companies with which he was connected he rearranged the nomenclature of the oils, giving new names to the old and names to new oils, that is, ones which had not theretofore been manufactured. He has read practically all the literature on the subject he could find, including technical books on the subject of manufacture and use, and treatises on the apparatus in the use, manufacture and test of petroleum and its products, also current trade papers, government publications, bulletins of technical societies. In 1915 he read and criticised for Dr. Bacon the work of Bacon & Hammer known as "American Petroleum Industry," which is today considered the most comprehensive and best work on the subject of petroleum (*Rec.*, p. 670). His aid in this respect was acknowledged in the preface. This work covers the entire range, from the geological part of the production to the shipping of the finished product, and to some ex-

tent their uses. In 1917 he revised the manuscript of a proposed text-book on the manufacture of petroleum for the International Correspondence School. He has recently reviewed the manuscript of a forthcoming work by Hammer & Padgett on the evaluation of petroleum and natural gas. He has written many papers on the subject. He is a member of technical societies, which bring him in contact with a wide range of subjects pertaining to the petroleum industry (*Rec.*, pp. 670, 671). The ordinary way of refining crude oil is to charge it into a still over a furnace, the fire from which boils the oil in the still and it passes over as a vapor, which in turn passes through tubes submerged in water, which condenses the vapor into liquid. Crude oil is a substance made up of a large number of different liquids, and when it is boiled the first vapor coming over partakes principally of the lighter portions of oils, and as the heat rises the product that comes over is heavier in weight and darker in color and has more body. From the beginning of the business it was customary to call all that portion of the vapor down to the point of the material used for kerosene "naphtha", and that is the generic or family name (*Rec.*, p. 671). This crude naphtha product was divided up to suit the demands of customers, which division was generally made in a steam still, which made possible a better separation than the fire still. He quoted from Peckham's census report of 1885 showing that from crude oil about 15% naphtha was produced, but about a half of one per cent was made into gasoline, the balance of the naphtha fraction being what is specifically called naphtha. "Naphtha" is the strict technical name of all the lighter oils above kerosene, and is so used in all the authoritative literature, including government publications. The gasoline of the early days was used to make gas in Springfield gas machines, and that is where it got its name. This was for years the only thing that

was called gasoline (*Rec.*, p. 672). With the advent of automobiles, there was not sufficient of this material then called "gasoline" to supply the demand, and it was necessary to go deeper into the naphtha to get a heavier material, but they called this gasoline also. As automobiles increased in number, it was necessary for the manufacturers to make the carburetors so that they would burn heavier material, until now practically the entire range covered by naphtha is called "gasoline", and to some extent some kerosene is put in. Some people call the material used in cars benzine, others naphtha, others gasoline, and others gas. The refiner has to differentiate the materials in order to know what is really desired. The same material the automobilist uses and calls gasoline is called naphtha when used for a launch (*Rec.*, pp. 672, 673). The demand for gasoline has caused the invention of what is known as the cracking process, which consists in the destructive distillation which results in breaking up the heavier oil into lighter oil (*Rec.*, p. 674). Naphtha has other sources of origin than petroleum oil. It is made from coal tar products, and there is a naphtha which comes from shale, as well as the naphtha from natural gas or casinghead gas. It is extracted from casinghead gas by a process known as the absorption process, as well as the compression process. This absorption process is a patented process, under a patent issued to George M. Sayboldt, of Bayonne, New Jersey, who is a man of international reputation of forty-three years' experience in the business; the inventor of a tester and viscosimeter; he is also the inventor of the Sayboldt chromometer, also called a colorimeter, which is the machine used for determining the color of oils (*Rec.*, p. 675). The process used for extracting the naphtha from casinghead gas by the Gypsy Oil Company is a compression process (*Rec.*, p. 676). It is not known scientifically whether the casinghead gas is

a part of petroleum or not. One theory is that it comes from rock strata where crude oil comes from, and others think it is distilled off from crude oil in the ground (*Rec.*, p. 676). That portion of crude oil which comes off before kerosene in the course of stillation is known as the "naphtha fraction" (*Rec.*, pp. 676, 677). A gas comes off incident to refining which is compressed and condensed in the same manner as the casinghead gas. It is precisely the same material as the casinghead product, and is a material that is used for blending to make gasoline (*Rec.*, p. 677). Gasoline, in a strict technical sense, is a refined distillate from petroleum of about 76° to 80° gravity, which is suitable for use in carbureting air for making a gas suitable for burning in private dwellings. Gasoline, as an article of commerce, embraces not only this, but is a combination of products of naphtha produced from crude oil, natural gas, casinghead gas, and other sources, which are made suitable for use in the general run of automobiles which use suction carburetors. It has to be suitable for such use, not a material that will run one make of car but any make of car with an ordinary suction carburetor (*Rec.*, p. 678). The material shipped to Port Arthur is not gasoline; it is unrefined naphtha, because it requires refining to fit it for the market (*Rec.*, p. 678). It is possible and some people do attempt to blend the casinghead condensate with heavier materials at the casinghead plants and market it as gasoline. The material shipped to Port Arthur, however, is not so blended, but is merely blended sufficiently to make it shipable and prevent loss in shipping (*Rec.*, pp. 678-680). Refining, as used in the petroleum business, embraces not merely purifying, but blending and all other processes necessary to bring the material to a given standard and place it in marketable condition. Silver may be refined in the same manner (*Rec.*, pp. 680, 681). The casinghead material has too

much light end in it to be of permanent character or to be used in suction carburetors, and too much light end for safety or economical use (*Rec.*, p. 682). An ordinary specification for gasoline is that there must be a recovery of 95%, while the material shipped to Port Arthur will recover but 80% to 85% on distillation (*Rec.*, p. 682). The liquid condensate, when dealt in as an article of commerce, is commonly sold to refiners for blending under a multiplicity of names, including "casinghead naphtha," "casinghead gasoline," "raw casinghead," "wild casinghead," "kerosene blend," "naphtha blend," and others (*Rec.*, p. 683). "Unrefined naphtha" is a perfectly proper designation for it, and is a satisfactory name, while "gasoline" is not. The reason for shipping the material to Port Arthur is to make it marketable (*Rec.*, p. 684).

Mr. Taber gave reference to a large number of technical works which supported his definitions of "naphtha" (*Rec.*, p. 773). These works embraced scientific works by the most noted authors on the subject, and include government publications and government patents (*Rec.*, pp. 776-782), including the Sayboldt patent, which is described as "obtaining naphtha from natural gas" (*Rec.*, p. 779). A technical paper, No. 74, issued by the Bureau of Mines in 1914, uses the term "unrefined naphtha," and gives it the same definition the witness does. Bacon & Hammer, in "American Petroleum Industry" (Bacon being Dr. Bacon, the witness whose testimony precedes this), also mentions "unrefined naphtha," and gives a definition of it that comprehends casinghead. It is the same definition as the Bureau of Mines' publication gives, namely, "those fractions that boil in a temperature up to 150 degrees centigrade equal to 102 degrees Fahrenheit atmospheric pressure," within which range of boiling points the casinghead product is embraced (*Rec.*, p. 783).

After the defendant had closed its case with those witnesses the court permitted the Government, over objection, in effect to reopen its direct case and put on two expert witnesses: one, Dr. Edwin DeBarr, vice-president of the Oklahoma State University and head of the Department of Chemistry thereof, with degrees from the University of Michigan, and professor of the state college since 1892, who testified that he had several years previously made an investigation, in the neighborhood of Bartlesville, of petroleum products; had tested out several plants, particularly cracking plants, and obtained considerable data in visiting absorption plants and refineries in the State of Oklahoma; that he had also investigated an explosion of casinghead gasoline at Ardmore; that he had made laboratory experiments and investigations of gases from various oil wells and oil from the gases from the Blackwell, Cushing and Glenpool fields of Oklahoma (*Rec.*, pp. 878-9). He testified that the product of compression plants is "casinghead gasoline"; that other kinds of gasoline are motor gasoline, casinghead gasoline, gas machine gasoline, cleaner's gasoline and many varieties, depending upon the purpose for which it is to be used; that casinghead gasoline is not properly denominated as unrefined naphtha because it is in most cases a pure, refined product; that its natural condition in the earth is refined; that the blending of it with naphtha which had been through "the usual three refinery processes" would not produce unrefined naphtha because both the products put together are refined, and that putting two refined products together is not a process of refining but simply a blending process (*Rec.*, pp. 879-80); that it would not be possible by further blending to produce gasoline; that casinghead gas is produced by a natural distillation process in the earth; that the fact that a particular gasoline was too volatile for economical uses in an automobile would not justify

calling it something else; that casinghead gasoline, while having practically the same chemical properties as refinery gasoline, has them in different proportions; that even though the product of a casinghead plant should show a recovery of but 88 on distillation, he would still call it gasoline, and that even though the product failed to meet specifications of customers for gasoline, it would not justify calling the material some other name, but that it would still be gasoline (*Rec.*, p. 880); that he knows of no scientific literature which refers to it as unrefined naphtha, though he has read extensively on the subject, nor has he ever seen it so denominated in trade journals. The only place he knows of which refers to it is the work of Bacon and Hammer (testified to by Mr. Tabor) and that does not describe casinghead gasoline as unrefined naphtha (*Rec.*, pp. 881-2); that during certain investigations he ran a Paige car part of the time on a mixture of compression and absorption product and in another case on a certain compression product, and drove a Ford car several hundred miles on a certain compression gasoline (*Rec.*, p. 882). This testimony was received over objection because of failure to identify the particular kind of compression gasoline used as similar to that produced (*Rec.*, p. 882). He admitted that the material was not suitable for "the common people to use" in a machine and would need to be regulated in its volatility for general use, although for a man like him it need not be regulated. The general public needs protection against its use, and he would not allow his wife to run it alone even if she had learned how to use it (*Rec.*, p. 883); that before the material is usable as gas machine gasoline, it would be better to have an acid treatment, and this product sells for double the price of the casinghead product and requires a great deal of care in making (*Rec.*, p. 884); that certain of the boiling points are a very substantial element as to whether the

material is usable; that when the initial boiling point is below 90 it will not start an ordinary car; it is hard to use it in a Buick but that some cars can be started by putting a few drops of gasoline in the pet cocks (*Rec.*, p. 884). The court would not permit him, on cross examination, to testify that taxes and inspection by the Corporation Commission of the state are not extended to this material as gasoline (*Rec.*, p. 885). In his direct examination he used the word refined as synonymous with pure. It was sufficiently pure for the purposes, but although a material might be pure it is also necessary in the manufacture of gasoline to correct its boiling points, which is frequently done at a refinery (*Rec.*, p. 885); that he has known casinghead to be blended into crude; that if the material was blended into crude, even though both it and the crude were pure, it would still be necessary to refine it in order to produce gasoline (*Rec.*, pp. 885-6). In the casinghead product there are undesirable materials which ought to be disposed of in order to make an economical motor fuel, but not necessarily to make it usable. This is one of the corrections of boiling points of casinghead material accomplished when it is sent to a refinery and one of the objects of sending it to a refinery. For general purposes the boiling points of casinghead are not proper boiling points for economical motor gasoline fuel (*Rec.*, p. 886). The difference in proportions of the constituents as between casinghead and straight refinery gasoline is the same distinction that determines all the naphtha products, there being a preponderance of heavier naphtha fractions in naphtha with a preponderance of lighter ends in refinery gasoline, although what was naphtha a few years ago is entirely different from what is naphtha today or even what might be called unrefined naphtha, the kerosene beginning much lower down (*Rec.*, p. 887). In casinghead, the lighter hydrocarbons are in larger proportion and the heavier in les-

ser proportion than in straight-run (refinery) gasoline (*Rec.*, p. 887). He has seen the name casinghead naphtha applied to the material in patents but was ignorant of the fact that the Interstate Commerce Commission's safe transportation regulations used it. It is a name coined in the last year or two (*Rec.*, p. 888). Naphtha is a proper designation of the lighter hydrocarbons and generally so used by writers. There is much interchangeability between the names naphtha and gasoline and extreme confusion, and it is quite generally true that people miscall the constituents of petroleum by the name of the finished product (*Rec.*, p. 888).

There could be such a preponderance of lighter hydrocarbons in the casinghead product as that it would not run a car. His recollection of Bacon and Hammer's definition of unrefined naphtha was that it comprised those naphtha fractions boiling up to 150 centigrade, and that from the testimony he heard of the material involved, it would come within that definition, and he has seen other casinghead gasoline which would (*Rec.*, p. 889); but while he calls it gasoline, many writers embrace it within the naphtha fractions (*Rec.*, pp. 889-90); that there is a difference of opinion whether the casinghead gas comes from petroleum oil or not, though he is not familiar with the decisions of the State of Oklahoma on the subject (*Rec.*, p. 890). He distinguishes this material from gasoline by designating it with the special prefix casinghead (*Rec.*, p. 890). He uses gasoline as a generic term, using it in the plural and, when desiring to specify particularly, uses a prefix and would embrace in that use a material, though slightly unfinished, but not if unfinished for the purpose for which it was to be used (*Rec.*, pp. 891-2). If the material has achieved that degree of finish to be used for gasoline, he would embrace it within the definition of gasoline (*Rec.*, p. 892). He understands that refiners are accustomed to using the term "refined" as applicable to the products produced

by their refinery, and the same is true of his reading and observation, and it applies to a finished marketable product that has been finished at a refinery or some collateral plant (*Rec.*, p. 892).

The other expert called by the Government was Dr. W. P. Dykema, a consulting petroleum engineer, a graduate of the Michigan College of Mines in 1905, from which year until 1909 he followed mining engineering, and then for two years did consulting work in the oil field of California, surveying and general engineering, and from 1911 to 1914 was again engaged in silver and copper mining. Following that he was a year with the city engineer's office in Los Angeles, and from 1915 to 1920 was with the United States Bureau of Mines, which he had just left to engage in consulting work. During the time he was with the government he specialized on natural gas gasoline work, including casinghead, during three years being located at San Francisco and the other two at the Bartlesville, Oklahoma, petroleum experiment station, of which he was petroleum engineer the first year and superintendent the second year (*Rec.*, pp. 822-3). He has made experiments and examinations in Pennsylvania, West Virginia, California, Oklahoma and Louisiana fields. He wrote Bulletin 151, and Bulletin 176 Division of Petroleum Technology and was a coauthor of Technical Paper 232 issued by the Bureau of Mines. Bulletin 151 deals with compression and 176 with absorption methods, and 232 with the extraction of gasoline from residue gas from compression plants by absorption process. The bulletins have been widely circulated by the Bureau of Mines (*Rec.*, p. 824). After this witness had heard the defendant's expert witnesses testify he undertook to make an experiment during the trial (unaccompanied by anyone on behalf of the defendant) as to whether or not a certain material produced from another plant at Jenks would run a Packard car. Notwithstanding the fact that on preliminary cross

examination he was unable to say whether he had drained the reserve tank of the car used, of the real gasoline before attempting the experiment, he was allowed to testify, over objection, that he filled the tank of the car with casinghead product and ran it in from Jenks to Tulsa without any difficulty whatever (*Rec.*, pp. 824-28). Although this testimony was ultimately ordered stricken from the record by the court, it was only after the defendant was able to and did locate and produce the driver, and find and prove that the actual fact was that the reserve tank of the car had not been drained, and that it had consequently been run on the real gasoline instead of, as testified by the witness, on the casinghead product (*Rec.*, pp. 892-896). This witness also participated on behalf of the Government in the joint experiment conducted during the trial and was in the Pierce-Arrow car. He admitted that the Pierce car, after starting out without difficulty, stalled at a point about seven miles beyond Jenks, and after relieving the pressure and cooling the engine somewhat they were able to start again and get to within about one hundred yards of the Kiefer plant, when it was again necessary to relieve the pressure and get the engine in shape before it could drive in. He believed if the carburetor had been adjusted the car would have run steadily on the material (*Rec.*, pp. 828-9). At the Kiefer plant ten gallons of the blended material was taken, and he testified the car drove into Tulsa without any trouble, leaving Kiefer at 12:20 and arriving in Tulsa at 1:03, a distance of nineteen or twenty miles, at a maximum speed of thirty-five miles an hour, and that in his opinion an even lighter material would have run the car, and that it was his belief that any liquid made from natural gas by compression, of whatsoever gravity, would run an automobile (*Rec.*, pp. 830-2). He has experimented in running a Dodge car with 105 gravity gasoline, and he said "the naphtha" was most satisfactory and he could see no reason why

even the lightest product, methane, would not be a good motor fuel (*Rec.*, p. 832); that in his opinion the material used in the test was gasoline (*Rec.*, p. 832). He does not consider the extraction of the condensate by compression of casinghead gas a refining process, but considers it a process of manufacture, a separation, and in his opinion the material is a refined product because it needs no purification (*Rec.*, pp. 833-4). It is his view that the material requires no refining after it is in a liquid state. The process underground, by which it is assumed the casinghead gas comes off the oil, is similar to the process involved in refining oil in a still, that is, as heat is applied to the oil the temperature rises and the various liquids come off in the order of boiling points, and in the earth the oil is under pressure which raises the boiling points, and after they are released practically the same thing happens as the various boiling points are reached (*Rec.*, pp. 837-8). The vapor rising from a crude still is very similar to the vapor coming from a well, and they are both condensed into a liquid which is the same, and for this reason, in his opinion, what transpires under the earth is a refining process, and the material is therefore a refined product (*Rec.*, pp. 838-9).

Gasoline is used for heating, lighting and cleaning purposes. In his opinion, the fact that the product of compression of natural gas would be too high in gravity for ordinary commercial use would not make it anything other than gasoline (*Rec.*, pp. 839-40). He testified that the liquid was commonly known in the trade and in the scientific world as gasoline, and he had never heard it called unrefined naphtha prior to the beginning of this suit, and that in his opinion that is not an appropriate name because it is misleading in the respect that it would need further refining and further purification which, in the majority of cases, it does not, though in some instances where there is lots of sulphur it must be refined out, which is not generally the case concerning

Oklahoma gas (*Rec.*, p. 840). The reason he believes it does not need further purification is because it is fit for use and marketable as it is. He would not call blending a part of the art of refining because it involves no purification, and stated that it is never referred to as a refining process. He regards the recovery of gases at a refinery as a measure of economy and not a process of refining (*Rec.*, pp. 841-2). He had visited the plant of the Gypsy Oil Company in 1916, saw the material, that it was casinghead gasoline, water-white in color, and could be compared to distilled water (*Rec.*, p. 852). It was not unrefined naphtha. The fact that the product of the Gypsy plant might show a recovery of only 90 per cent on distillation and fail to meet the specifications of customers would not show that that material was not gasoline. He would not consider the blending of casinghead gasoline with naphtha a refining of the casinghead, because it would not involve the removal of impurities, but he would term it a finishing process (*Rec.*, pp. 853-4). He considers a finishing process a blending of two materials together to reach certain specifications (*Rec.*, p. 854). There are two purposes in blending casinghead product, one, to make it less volatile for handling, and the other to conserve the product. Blending is usually done at a casinghead plant and the product is frequently marketed direct (*Rec.*, p. 854). The casinghead product could be marketed, without being blended, to buyers who make a business of blending that use it in blending with naphtha (*Rec.*, pp. 854-5). In his opinion blending would not be refining but merely a mixing. He has never seen the term unrefined naphtha applied to casinghead gasoline in any technical work, and so far as his knowledge goes it is not so applied in the scientific world (*Rec.*, p. 856). On cross examination he admitted that all scientific literature he had read on the subject uses the word casinghead as a part of the name casinghead gasoline. He was confronted with his own Bulletin 151, wherein he

characterizes the material in question as "condensate," and explains that weathering to a sufficient degree to make it shipable often results in extreme loss, whereas by blending with heavier refinery distillates this loss could be greatly reduced; that this has led "condensate producers" to take advantage of blending to increase the volume of products marketed and also the supply of marketable motor fuel, and "condensates produced by compression is also an undesirable fuel for gasoline engines. It is exceedingly volatile, which causes loss in handling, is dangerous because fumes are easily formed, and gives less power as compared with equal volume but heavier distillates, a larger number of gallons being required to develop the same power. It gives a quick, sharp explosion in a motor cylinder but seems to lack 'push' after the explosion has taken place" (*Rec.*, pp. 857-8). A small quantity of natural gas gasoline is sold to consumers unblended as gas machine gasoline, and some known as export gasoline sold in foreign trade; further, that the great bulk of condensate is blended one way or another before it reaches the consumer, but not always completely blended at the plant where made (*Rec.*, p. 858). He then admitted that the material might properly be termed unfinished gasoline if it was still to be finished by further blending in order to meet some specifications (*Rec.*, pp. 858-9). Further in his bulletin it was shown that he related the very practice followed by the Gypsy Company of blending in stages at different points, and then admitted that the operation was not complete until finished at the refinery (*Rec.*, pp. 859-60); following which his bulletin states that where the blending is by refining or blending companies as last described, "the operation is complete and the blended product is ready for market" (*Rec.*, p. 860). Excerpts from his bulletin also related the practice of partial blending at the casinghead plant and explained that some operators, because of the cost of bringing in the large quantities of

naphtha necessary, or because they control a refinery and desire to refine the gasoline by a further treatment such as distilling, follow the practice of blending at the compression plant only so far as necessary for shipment, the final blending and treatment being given at the refineries or points where the desired quantities and qualities of distillate may be more readily obtained (*Rec.*, p. 860).

He defined gasoline as the lighter petroleum distillate fit for use in an ordinary automobile (*Rec.*, p. 863); that gasoline is a finished product of a petroleum refinery (*Rec.*, p. 865), and that it is a product of the fraction of petroleum long known under the generic name naphtha, which includes all those lighter hydrocarbons above kerosene. Gasoline and naphtha are names interchangeably used with relation to the material of which the finished product, gasoline, is made, and naphtha is a generic term which embraces gasoline (*Rec.*, p. 866). He stated that the process of distillation in a refinery which produces still gas is a parallel process to that under the earth and that for that reason he considered the casinghead product refined, although he would not go so far as to call the still gas refined gasoline before condensation, but claimed that it might be, after condensation, and gave as the only instance to his knowledge of it being so sold an occurrence in Alaska in 1913 (*Rec.*, pp. 867-8); and, so far as he knew, in the United States the practice was universal to further refine the material before it was sold as refined gasoline, and blending was practiced at refineries of this material long before casinghead gasoline was known (*Rec.*, p. 868). When his theory, that the separation of the constituents underground amounted to refining as applied to the casinghead condensate, was attempted to be applied to the remaining crude, he could not see how you could consider the crude oil refined (*Rec.*, pp. 868-9). He finally admitted that his notion of a refining process was making a thing pure by the re-

removal of impurities, and that it could therefore be said that a thing which it was unnecessary to make pure, because it was pure, would be unrefined (*Rec.*, p. 869). Trade publications do not quote the material as gasoline but as raw casinghead, or casinghead, or some particular kind of blend. He never knew of a curb filling station selling raw casinghead material as gasoline (*Rec.*, pp. 870-1). The ordinary scientific tests to determine whether or not a material is gasoline are from the boiling points obtained by fractional distillation (*Rec.*, pp. 871-2). The naphtha fractions, upon being separated from the crude in a refinery, might properly be called unrefined naphtha; and the first time he heard the expression it imported to his mind the lighter cuts of petroleum which needed further purification, a part of which cuts is the material from which gasoline is made, and it would embrace the so-called still gas gasoline (which he previously admitted was identical with the casinghead product) (*Rec.*, pp. 838, 872-3). When gasoline fails to reach specifications it is ordinarily blended to get it to some marketable specification (*Rec.*, p. 873). The casinghead material is frequently and very generally used by refiners as a raw material from which to make gasoline (*Rec.*, p. 873). His Bulletin 151 is *Exhibit 150*; Bulletin 214, of the Bureau of Mines, by E. W. Dean, is *Exhibit 151*, and shows that the Government itself uses and recommends the practice of determining the material by distillation curves (*Rec.*, pp. 874-5).

As reasons why this Court should review this case, the Solicitor General, at page 11, under Point II of his Brief, asserts that it is a case of great magnitude, upon the determination of which the rights of many other parties depend; and the Director General, on the opening page of his Brief, asserts that the judgment of the Circuit Court of Appeals probably subjects him to liabilities for overcharges in this respect aggregating \$500,000.

Why these assertions are persisted in in the face of the known fact that, apart from the other indictments relating to the same transactions, there is only one other cause that can be affected, *i.e.* the suit of the Texas Company for far less than \$100,000 (and the statute of limitations has long since run against any other possible overcharge suits), is inexplicable.

Next, the Solicitor General, under his Point II, asserts that the article is generally known by the trade and in commerce and among those by whom it is produced, used and consumed, as gasoline. These statements are directly contrary to the evidence. The only attempt made by the Government to prove the practice of the trade in relation to what the material should be called, was by the witness Haigh of the Ajax Company, who stated (*Rec.*, p. 396) that he designated the material shipped by his company as gasoline "simply as a trade name"; and this testimony was immediately stricken out on motion of the defendant (p. 397) on the ground that the witness was not qualified; and on his cross-examination (p. 402) it developed that what the witness was in fact talking about was a blend to a gravity of 56 to 58 degrees—one which defendant concedes might be deemed gasoline—; and he further testified on cross-examination that he did not call the unblended material similar to that shipped by defendant gasoline, but that it was sold and shipped to refineries, he supposed, to be further refined (*pp.* 401-404).

Next, under Point III (p. 12), the Solicitor General asserts, as does the Director General (*Point I*, p. 2), that the Circuit Court of Appeals disregarded entirely the regulations of the Interstate Commerce Commission made within the scope of its authority under the so-called Transportation of Explosives Act, and thereby practically nullified the powers of the Government under that Act.

The fact is that the Safe Transportation Regulations were in no wise in issue in the District Court; the only contention made by the Government with respect thereto being that they were evidentiary of the fact that the material should be called gasoline, and they were so received by the Court and submitted to the jury.

As before pointed out, these regulations were not made pursuant to the Commission's authority to make rates, but expressly under its authority under the Transportation of Explosives Act, and they do not purport to affect or control rates.

Furthermore, as stated in the Government's petition (p. 7), there are other indictments pending against respondent charging violation of the Safe Transportation Act; and it was shown that the defendant, in fact, by the use of the double description, continuously complied with the Safe Transportation Regulations as such, which fact was even conceded by the Government.

Next, the Solicitor General, under Point IV (p. 12), and the Director General, under Point II (p. 2), of their respective briefs, assert in substance that the administrative functions of the Commission are interfered with by the opinion of the Circuit Court of Appeals, and they cite the decision of the Commission in *Southern Carbon Co. v. Arkansas & L. M. Ry. Co.*, 62 I. C. C. 733, in support of their contention. The Commission has never passed on the question in its administrative capacity, and the very contention that the Commission's administrative functions are involved concedes the argument made under Point IV (3) hereof that in such case the District Court was without jurisdiction until the Commission should pass upon the subject. However, the case cited does not sustain their contention, as the Commission did not pass upon the applicability of the description "unrefined naphtha" in that case, there being no rates under that description in effect, but simply in sub-

stance held that under the rates there available the "gasoline" rates were applicable. And, in its most recent decision (February 6, 1925) mentioning the product, the Commission refer to the blending of "casinghead gasoline to produce commercial gasoline."

*Transcontinental Oil Co. v. A. & V. Ry. Co.*, 96  
I. C. C. 136, 137.

At page 13 of his brief, the Solicitor General argues that the Circuit Court of Appeals erred in holding that the Government throughout the trial improperly insisted that the conduct of the defendant was fraudulent.

Respondent contends that a charge of defrauding the carriers (amenable under Section 10 of the Interstate Commerce Act) is repugnant to and inconsistent with the charge in the indictment of receiving a concession, which matter is argued under Part III (a) hereof.

At page 22 of the Solicitor General's brief, he states that it was admitted that from the time the plant was constructed in 1913, up to the end of 1914 or 1915, the practice was to ship naptha from Port Arthur to Kiefer, and there blend it with casinghead gasoline, and ship the blended product to northern points, describing it as "gasoline". If this statement intends to convey the inference that the commodity shipped in 1913, 1914 and 1915 to northern points was the same as that subsequently shipped to Port Arthur under the designation "unrefined naptha", it is directly contrary to the evidence. The admission was clearly limited (*Rec.*, p. 481), and the evidence definitely shows that in these earlier days the material shipped North was fundamentally different from that subsequently shipped to Port Arthur as "unrefined naptha". It shows that what was shipped North to market was a product the result of a blend in about opposite proportions designed to make gasoline, and which was in fact sold as gasoline, and which defendant conceded, and now concedes, was and is gasoline, although of a poor and unsatisfactory quality, which was the cause of the discontinuance of the efforts to blend to

the extent of making gasoline in the field (*Rec.*, pp. 549, 550, 555). The very fact that the Solicitor General is himself misled as to the effect of this evidence is the best demonstration of the impropriety of its admission.

At page 27 of the Solicitor General's brief, the testimony of the witness Haigh of the Ajax Company, above referred to, stating that he used gasoline "simply as a trade name", is quoted. As above pointed out, his testimony was stricken out, and his cross-examination showed he was talking about a different material—one which defendant concedes might properly be called "gasoline".

The Solicitor General states (*Brief*, pp. 29, 30) that respondent contends that a product is not gasoline and should not be so shipped "unless it meets the *specifications of the particular order*."

Recognizing that this assertion is contrary to the whole trend of respondent's contentions, the Solicitor General deems it necessary to substantiate this assertion by quoting from a discussion between respondent's counsel and the Court, but carefully cuts the quotation off to exclude counsel's explanation that it was respondent's contention that it would be shown that the material material in question "is not gasoline by any of the accepted standards" (*Rec.*, p. 318).

Again, the Solicitor General refers to the testimony of the witness Pritchard at pages 590 and 602 of the *Record*, as in substance indicating that, although he might consider a product gasoline because it met the specifications of one purchaser, he would not consider it gasoline for another purchaser whose specifications it failed to meet. The witness was the Government's own witness, even though he was an employee of the respondent. But his testimony does not fairly import that he would contend that such a material was not gasoline for shipping purposes. He was simply answering the query of the Court, and undoubtedly with accuracy, that he would not ship gasoline of one specification on an order calling for gasoline of a different specification.

At pages 38 and 39 of the Solicitor General's brief, he quotes from the testimony of the general freight agent of the Frisco, which he argues substantiates his contention that the carriers did not know what the commodity was that was to be shipped under the designation "unrefined naphtha". It is a matter of common knowledge, as the witness testified, that it is not one of the functions of a general freight agent to inspect the commodity tendered by a shipper to see whether it agreed with the tariff description used by the shipper. On the other hand, the evidence shows that the local freight agent, within whose cognizance such a question peculiarly is, was advised at the time the rates on unrefined naphtha were initiated that the material theretofore shipped as *gasoline* would thereafter be shipped as *unrefined naphtha* (*Rec.*, pp. 550, 557); and it was expressly the duty of the safe transportation inspectors to enforce all the safe transportation rules, including Rule 1712, which required that the proper tariff name be used in billing the commodity (*Rec.*, pp. 429-436). And for more than two years they did this without raising any question.

At page 46 of his brief, the Solicitor General quotes Dr. Garner's testimony as to the definition of "gasoline" that it

"would be that low boiling portion of naphtha having a gravity from 76 possibly to 82 and usable for the purpose of illumination";

and then states that this is an exact description of "casinghead gasoline". This assertion is utterly unwarranted by the testimony. It is true that casinghead gasoline is generally within the ranges of gravity mentioned, but there is not a word of testimony to the effect that it is usable for the purpose of illumination; and it is impossible to read the testimony of any of the experts without reaching the obvious conclusion that the casinghead gasoline is far too dangerous to be usable for the purpose of illumination.

Again, at pages 46 and 47 of the Solicitor General's brief, Dr. Garner and Dr. Bacon's testimony is criticised to the effect that the material, to be called "gasoline", must be suitable to run a motor car, as being inconsistent with the fact that "it was demonstrated that it would successfully operate a Pierce-Arrow car". How successfully it did operate that car, has already been shown. But there is no inconsistency whatever in their testimony, and the fact that the casinghead did run the Pierce car under certain most favorable conditions. The evidence shows that a car had also been run on crude oil from the Garber Pool; yet the Government would hardly contend that that fact made that crude oil gasoline.

At page 55 of his brief, the Solicitor General, in describing the joint tests made during the trial, says there is no testimony with reference to the operation of the Packard car, and that presumably therefore there was no trouble in the operation of that car. How such a statement can be made is inconceivable. Both Col. Burrell and Dr. Garner testified that in the test with the Packard car the material failed absolutely, the car going completely "dead", although every opportunity was afforded the Government's experts to try to make it operate (*Rec.*, pp. 797, 798, 800, 843-851); and the Government—apparently to avoid putting its own expert who was in the Packard car on the stand, because of the admissions he would have to make—waived their previous claim that he was an expert, although sent by it expressly for the purpose of witnessing the test (*Rec.*, p. 804).

Next, at pages 55 and 56, the Solicitor General gives the Standard, Webster and Century dictionary definitions of "gasoline", every one of which states the use to which gasoline is put: the Standard—as fuel in vapor-stoves and for carbonizing air and water-gases; the Webster—as a solvent for oils, fats, etc., as a carburetant, and to produce heat and motive power; and the Century—for saturating air or gas in gas machines or carburetors,

and in the engines of motor vehicles. And, in the face of the fact that the testimony overwhelmingly shows that not only is the material shipped not used for these purposes, but is even admitted by the Government's experts to be not suitable for such use, the Solicitor General baldly asserts that the commodity shipped is strictly in accordance with the technical definition of gasoline.

Throughout its argument, as on the trial, the Government insists that gravity is the sole test of whether or not a material is gasoline. It abundantly appears by all the expert testimony that, although a material must be within certain ranges of gravity to be gasoline, the mere fact of so being does not make it gasoline. It must meet numerous other tests as well. It would seem that common sense would demonstrate that if the material shipped was in fact gasoline, the respondent would sell it as such in markets near its production, instead of going through the expensive operation of carrying coals to Newcastle that would be involved in paying freight to carry it to Port Arthur, where the great body of respondent's gasoline is made, under the necessity of its being thence again reshipped to market, with additional freight charges.

At pages 60 and 61, the Solicitor General presents the novel argument that if, as he contends, the material is in fact gasoline, the Court should have so instructed the jury and that consequently

“no harmful error could be committed by the court in the admission of evidence, or in his charge to the jury, or in refusing to charge requests presented by the defendant, or by counsel in presenting the Government's case to the jury.”

Such a contention would support an argument that in similar circumstances a conviction by a jury composed of but ten members should be sustained because no harm could have been done the defendant.

Finally, the Solicitor General cites several cases by the Interstate Commerce Commission and the Courts, in substance to the point that a question such as that here involved is to be determined by the trade understanding, name or custom. These cases but go to support the respondent's contention. The Solicitor General evidently cites them in reliance on the testimony of the witness Haigh quoted at page 27 of his brief, apparently in ignorance of the fact that this testimony was stricken out, as previously pointed out, and of the further fact that all the evidence, and the only evidence, on the question of trade custom is entirely with the respondent; that is, that the material is not called or sold in trade as gasoline (*Rec.*, pp. 683, 699, 867, 868, 870, 871).

At pages 74 and 75 of his brief, the Solicitor General asserts that

“Had the shipments been billed under any of the designations authorized by the regulations, and hence by the tariffs, the gasoline rate or a rate not lower than the gasoline rate would have been applied.”

This assertion is directly negated by the facts admitted by the Government on the trial, that throughout the period when the regulations read that the material *may be shipped* as gasoline, the bills of lading, in addition to the description “unrefined naptha”, bore a specific reference to the Casinghead Rule 1824-K and a stamp showing that the placard usable only on casinghead products had been applied to the car, and after the rules became mandatory that the commodity *must be billed* as “gasoline”, “casinghead gasoline” or “casinghead naptha”; that the bills of lading bore both descriptions “unrefined naptha” and “casinghead naptha” and the placard stamp (*Rec.*, pp. 429-436).

It was not because of ignorance concerning what the material was that was being shipped as unrefined naptha

that that rate was applied—on the contrary, every one concerned throughout the more than two years involved well knew all along—it was because some one changed his mind about the matter that the question arose.

At page 76, the Solicitor General again insists that the Circuit Court of Appeals was entirely mistaken concerning the opinion of the Interstate Commerce Commission in the *National Refining Company case* (23 I. C. C. 527). We insist the contrary is the fact, and that the Court thoroughly apprehended that case. The mere fact that the toppings there in question were of small value is not of controlling moment. It would of course be of importance if the reasonableness of the rate was in question, but it has no bearing on the issues here. Indeed, if it were not for the use which has been found for the casinghead condensate, the chances are its value would be even less than were those toppings. As the evidence shows, the gas from which the condensate is made was formerly wasted altogether.

The Director General, at pages 30 and 31 of his brief, accuses defendant's counsel of skillfully misleading the witness League into admitting that there "might have been" some difference between the degree of blend of material shipped by others and that shipped by the Gypsy Company; and accuses the Circuit Court of Appeals of misconceiving the true significance of League's testimony that the blend of certain other shippers who shipped and described the blended commodity as "gasoline" contained as much as 75 per cent naptha (*Rec.*, pp. 446, 447, 441). The only misleading or misconception there is involved is in the attempt on the part of the Government to represent that the degree of blend is of no importance in determining what the material is. Neither at the trial nor now does defendant contend that a blend consisting of 75 per cent naptha and 25 per cent casinghead should not be called gasoline. On the con-

trary, defendant admitted on the trial that gasoline could be made by such a blend, and that it had in fact itself made, shipped and sold it as such in the earlier days of its operation of casinghead plants.

Again, at page 31, the Director General asserts that the only plausible theory upon which defendant can justify its course is, that the blending was done with heavy naptha, and that such naptha being crude and not refined thus an unrefined naptha is made; and then proceeds to knock down this plausible theory by the argument that therefore the more the naptha, the more unrefined. The trouble with this argument is that the only party which has advanced any such theory is the Government itself, and that for the obvious purpose of criticising it.

The defendant does not contend, and has not contended, that the addition of the crude naptha to the casinghead makes it unrefined. As has been stated over and over again, the grounds upon which the defendant asserts that the adjective "unrefined" is appropriate is that the material is unfinished; that it needs to be taken to a refinery to be finished; that such finishing consists in blending; that blending is an integral part of the art of refining; and that until the material is finished it is in an unrefined state. And this applies to the unblended casinghead just as much as to the blended.

At page 38, the Director General repeats the assertion of the Solicitor General, to the effect that the respondent contends that no material is gasoline unless it fulfills the particular specifications of a particular customer, which, as before pointed out, is quite unwarranted.

At page 39, the Director General attempts to draw some broad distinction, which he supposes to exist, between a distillate and a condensate. Evidently he does not understand that all distillates are in fact condens-

ates; nor the Government's own experts' theory that the casinghead condensate was a distillate, the first operation of which was produced by nature underground (*Rec.*, pp. 837-839, 879-880).

The Director General, at page 49, and again at page 54, referring to still gas gasoline, denominates it "still gasoline".

With such an utter misconception of terms, it is impossible to point out the fallacy of his contentions without a detailed reference to the testimony, the substance of which is hereinbefore set forth at length.

At page 71, the Director General calls attention to the fact that one of the Government's experts never heard of casinghead naptha before hearing it in this case; which but betrays the inexpertness of the witness himself, since it is a term specified by the Interstate Commerce Commission in its Safe Transportation Regulations set forth in italics by the Director General on page 18 of his own brief.

The Director General seems to make much point of the testimony of some of the experts to the effect that, while they considered the name "unrefined naptha" entirely appropriate, if they were choosing a name that would be more descriptive in their mind they would prefer "unfinished naptha". While we regard this as of no importance, it may be observed that the respondent, in its telegram quoted at page 77 of the Director General's brief, requested the carriers to establish rates on "unfinished naptha"; and it was apparently either by accident of the carriers or through a desire to follow the precedent established in the Muskogee and Carterco rates that the term "unrefined naptha" was used in the tariffs, instead of "unfinished naptha".

At page 79 of the Director General's brief, referring to the Commission's decision in *National Refining Co. v. M. K. & T. Ry. Co.*, 23 I. C. C. 527 (printed in full at page

1378 of the *Record*), it is stated that a reference thereto will show that the Commission

“held the gasoline rates legally applicable, but merely unreasonable,” etc.

This is an absolute misstatement of what the Commission held.

Reference to the opinion shows that the carriers contended that the product there in question should be classified as a refined oil; that the complainant contended it should not; and, after stating these contentions and the fact that the product

“seems to have no distinct commercial designation or trade name” (*Rec.*, p. 1381),

it says:

“Moreover, this light end distillate, while it has been increased in value by a process of manufacture, was not what is commercially understood as a refined product of petroleum oil”.

And finally concludes (*Rec.*, p. 1383) with a repetition

“that there is no trade name or commercial designation for the commodity here in question, and we deem it best to leave the description of this commodity in the first instance to defendants, who were doubtless so able to amend their tariffs as to establish the rates above found reasonable in such language as will not lend itself to misunderstanding or afford opportunities for mis-billing.”

Manifestly, it would be a contradiction in terms for the Commission to say that the gasoline rates were legally applicable, but merely unreasonable as applied to this particular commodity. The very statement imports that the particular commodity is not gasoline.

From this necessarily lengthy review of the evidence, these things would seem to be apparent, as pointed out in the motion to dismiss or affirm:

That there is involved in this case no question of uniformity of decision; no question of peculiar gravity or of general importance; that the judgment of the Circuit Court of Appeals does not, as represented on the petition for the writ, have any bearing on the Transportation of Explosives Act; that the Circuit Court of Appeals did not, as represented on the petition for the writ, take the "extradordinary action" of reversing and remanding for dismissal; that the case involves solely one contested question of fact; that the judgment of the Circuit Court of Appeals merely reverses, with directions to grant a new trial, for errors committed in the District Court; that there is an effort now by the Director General to make an issue concerning tariff construction which did not exist in the courts below. The petition presents one case, the briefs show another. The inducing petition fails to give adequate information concerning the record and essential facts. The case set up on the argument now is radically different from that set up in the petition. (*James C. Davis, Agent, etc., v. J. M. Currie; Missouri Pacific R. R. Co., Pet'r, v. R. L. Hanna; Erie R. R. Co., Pet'r, v. Morris Kirkendall*; all decided November 17, 1924; 69 L. Ed. 85, 56). And it is believed the writ should be dismissed.

Since the respondent's brief in support of its motions to dismiss or affirm was filed, the section of the Judicial Code under which the Government claims authority for a review of a decision adverse to it in a criminal case, *i. e.* Section 240, has been revised by the Act approved February 13, 1925 (H. R. 8206, 68th Congress), apparently with the object of authorizing such review. The section now reads:

"Sec. 240. (a) In any case, civil or criminal, in a circuit court of appeals, or in the Court of

Appeals of the District of Columbia, it shall be competent for the Supreme Court of the United States, upon the petition of any party thereto, whether Government or other litigant, to require by certiorari, either before or after a judgment or decree by such lower court, that the cause be certified to the Supreme Court for determination by it with the same power and authority, and with like effect, as if the case had been brought there by unrestricted writ of error or appeal."

It will be noticed that the following important changes have been made:

That the Government is expressly specified as a party entitled to petition; that the case may be removed either before or after judgment, and that it may be determined by the Supreme Court

"as if the case had been brought there by *unrestricted* writ of error;"

and that it applies to the removal of cases from the Court of Appeals of the District of Columbia; and the limitation of cases made final in the Circuit Court of Appeals by the provisions of that Act is eliminated.

It would seem that those changes demonstrate that the Government was not considered as a party entitled to petition under the language previously used, and that there was an effort to get away from the decisions in the *Sanges* and *Dickinson* cases by the insertion of the word "unrestricted" before "writ of error".

Also since that brief was filed this Court decided *United States v. Joseph Weissmann*, December 15, 1924, 69 L. Ed. 147, again reiterating its conclusion that the Criminal Appeals Act authorized writs of error in favor of the Government only in a restricted class of cases, from which it would seem that the limitation on Section 240 previously existing, for review by certiorari

“with the same power and authority in the case as if it had been carried by appeal or writ of error to the Supreme Court,”

would have confined it only to that restricted class of cases covered by the Criminal Appeals Act.

### **Groupings of Respondent's Assignments of Error in the District Court.**

The assignments of error have been grouped to be argued together hereinafter, as follows:

I, II, III and CXVIII (1), which relate to a motion to strike the indictment from the files, and plea in abatement to it, and refusal to permit proof on the plea in abatement; under Part II.

IV and CXVIII (5), being order overruling special demurrer for duplicity of certain counts, and motion in arrest of judgment respecting the same; under Part III (d).

V and CXVIII (2, 3 and 4), being order overruling demurrer to indictment and motion in arrest of judgment; under Part III (a, b and c).

VI, LXXXII, CXVII (13, 14 and 15), and CXVIII (5), being order overruling motion to instruct a verdict for defendant; under Part IV (a).

VII, VIII, IX, X, XI, XII, XIII, XIV, XV, XXXI, XXXII, XXXIII, XXXIV, XXXVIII, XXXIX, XL, XLI, XLII, XLIII, XLIV, XLV, XLVIII, XLIX, LI, LII, LIII and LXXXI, being evidence admitted on the theory of admissions, and order overruling motion to strike out same; under Part IV (b).

XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII, L, LXXXI, being evidence admitted concerning practices of others not connected with defendant, and order overruling motion to strike out such evidence; under Part IV (c).

XVI, XVII, LXIX and LXXX, being evidence admitted directed to the discrimination counts, and order overruling motion to strike out same; under Part IV (d).

LVI, LVIII, LIX, LX and LXXXI, being evidence relating to other parties using unidentified material; under Part IV (e).

LV, LVII, being evidence admitted concerning an alleged test; under Part IV (f).

XXXVI, XXXVII, XLVI and LXXXI, being admission of evidence upon the theory of establishing intent, and order overruling motion to strike out same; under Part IV (g).

LIV, LXXIV, LXXXIII, being evidence and charge to jury concerning rates and tariffs; under Part IV (h).

LXII, LXIII, LXIV, LXV, LXVI, LXXI and LXXIII, being rejection of evidence tendered by defendant concerning practices of others; under Part IV (i).

LXI, LXVII, LXVIII, LXX, LXXII, being rejection of evidence offered by defendant on various matters; under Part IV (j).

XXIX, XXX, XXXV, LXXV, LXXVI, LXXVII, LXXVIII and LXXIX, being improper comment and procedure in presence of jury; under Part IV (k).

LXXXII, being order overruling motion to direct a verdict for defendant; under Part IV (l).

LXXXIV to CXVI, inclusive, being instructions to jury requested by defendant and refused by the court; under Part IV (m).

CXVII, being order overruling motion to set aside the verdict and grant new trial, and CXVIII and CXIX, being order overruling motion in arrest of judgment( additional grounds) and sentence; under Part IV (n).

## PART II.

**The indictment not having been read to the grand jury, cannot be said to be their conscious and intelligent action, and therefore the motion to quash the plea in abatement should have been sustained (Assignments of Error I, II, III and CXVIII [1]).**

On arraignment the defendant filed a plea in abatement and a motion to quash and set aside the indictment on the ground that it was not in truth and in fact a true bill, because it had not been read to or by the grand jury, and they did not at any time know the contents thereof, and consequently did not vote upon the same (*Rec., pp. 145-148*); which plea and motion the Court struck out on motion of the Government, declining to allow defendant to make proof of its plea, apparently on the theory that inquiry into the doings of the grand jury would not be permitted to dispute its record.

The Fifth Amendment to the Constitution of the United States, among other things, provides:

“No person shall be held to answer for a capital or otherwise infamous crime unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia when in actual service in times of war or public danger \* \* \*”

The evident and expressed purpose of this amendment is to secure to persons, freedom from criminal prosecution, except on presentment or indictment by grand jury, unless such persons belong to the excepted classes mentioned in the amendment. In order for the persons sought to be protected by this amendment, in order to give the amendment the force and effect it was intended to have, in order to have an indictment found by the grand jury, in order to prevent robbing the amendment

of vitality, the indictment or presentment found, must be of necessity, the free and conscious act of the grand jury. The indictment or presentment must be couched in the language of the grand jury or in that of some other person consciously adopted by the grand jury as its own. If an indictment or presentment is not couched in the language of the grand jury, if the indictment or presentment is not drawn by another as directed by the grand jury, if the indictment or presentment has not been read to the grand jury, and they do not know what it contains, it cannot be the conscious and intelligent action of the grand jury, and therefore, it cannot, in any just sense of the term, be said to be an indictment found and presented by the grand jury. If an indictment containing many hundred pages and consisting of charges of one hundred different offenses, can be presented to a grand jury as an indictment, and such instrument not read to the grand jury and the grand jury being unacquainted with its contents, endorse it as a true bill, and return it in open court, if such a paper can in any just sense of the term be called an indictment, it is evident that the security intended by the above amendment to be conferred on the citizen, is at once destroyed and of no avail.

The office of the grand jury at common law, was to protect the citizen or subject against unjust prosecution, to make such prosecution depend upon the intelligent action and independent judgment of the grand jury, and not to be instituted at the mere desire, whim or caprice of prosecuting officers representing the crown, and the purpose of the above amendment was to secure and to perpetuate this independent action of the grand jury, and to prevent a citizen or resident of this country from being criminally proceeded against at the mere dictation of the officers of the general government; to prevent such citizen or resident being haled into court to answer any charge, infamous in character, except on the intelligent and independent inquiry of a grand jury. The whole

scheme of criminal prosecution existing in this country and sought to be established by the fifth amendment, will be destroyed if officers of the government are permitted to draw indictments, not acquaint the grand jury with their contents, to have the foreman indorse the indictments "a true bill", and return the same into court as the action of the grand jury.

In *United States v. Farrington*, 5 Fed. Rep. 343, motions were filed to quash the indictments, and among other grounds for so doing, was the ground that the indictments were not read to the grand jury, nor the substance of the various counts explained. The indictments were quashed on other grounds and the court did not pass on the particular ground above named, its action on the other ground seeming to make it unnecessary to pass directly on the point that the indictments should have been read to the grand jury. It was insisted that the court could not go behind the return of the grand jury of the indictments to the court, and determine what took place in the grand jury room, but that the indictments must be received as part of the records of the court and free from attack. After reviewing many of the authorities, Judge (afterwards Justice) WALLACE, on page 347, says:

"The rule which may be adduced from the authorities, and which seems most consistent with the policy of the law, is that whenever it becomes essential to ascertain what has transpired before a grand jury it may be shown, no matter by whom; and the only limitation is that it may not be shown how the individual jurors voted or what they said during their investigations (citing authorities), because this cannot serve any of the purposes of justice."

On page 345 it is said:

"It is the duty of the court, in the control of its proceedings, to see to it that no person shall be

subjected to the expense, vexation, and contumely of a trial for a criminal offense unless the charge has been investigated and a reasonable foundation shown for an indictment or information. It is due also to the government to require, before the trial of an accused person, a fair preliminary investigation of the charges against him. The cases are frequent when, after all these precautions have been observed, it appears upon the trial that the government has been subjected to discredit and expense which might have been avoided if there had been a more careful preliminary investigation."

In *United States v. Terry, et al.*, 39 Fed. 355, pleas in abatement were filed to the indictments, among other things setting up that the indictments were not read to the grand jury. The court held that the pleas were bad as they tended to contradict the record, but held that the pleas could be treated as motions to quash the indictments and the court so proceeded to consider them and determine the points raised. In discussing attacks on indictments, Judge HOFFMAN, at page 357, says:

"But it has been held that the testimony of grand jurors may be received to show that under a misapprehension of the law the indictment was found on a majority vote of the jury, and without concurrence of twelve of the number, and that therefore it was void, and no true bill; and, *secondly*, that the court, while recognizing the absolute verity which a regular judicial record imports, and the policy on which the rule is founded, yet holds that there has always been and always must be from the necessities of the case a power in the court to vacate or cause to be amended a record which has been erroneously or falsely made, by inadvertency or otherwise, by any of its officers; and that it is competent for it to say, if the claims of justice require it, 'This is not our record; it is false and erroneous, and the authentication it bears is unauthorized and unwarranted'."

It is true the question in the above case was decided adversely to our contention in the case at bar, but it is to be noticed that in the cited case, it appeared that the indictments were brought to the grand jury, that the grand jury apparently knew what was contained in the indictments, and that the grand jury in the presence of the district attorney agreed to dispense with the reading of said indictments and to present the same to the court without reading or hearing read, the said indictments. In the cited case the court was enabled to say from the record and the hearing on the motion (*page 359*):

“This case was, therefore, passed upon, and the bill substantially, though not technically and formally, found, before the alleged communication to the grand jury of the alleged wishes of Mr. Justice FIELD was made to them. The jury, saw fit to dispense with the reading of the indictments, relying, as they had a right to do, that the district attorney had, in framing the bills, obeyed their directions.”

Mr. Edwards, in his work on the Grand Jury, criticizes the *Terry* case above quoted, and says:

“If the grand jury after hearing the evidence find a true bill without it being read to them, it has been held not to afford ground for setting aside the indictment so found. It is difficult, however, to reconcile this decision with the ruling in *Ex Parte Bain*. It can hardly be said that the finding of a bill, the contents of which are unknown to the grand jurors, is any more their finding than the bill altered in substance after presentment. The grand jury have no knowledge of the nature of the charge to which they give their sanction. They may vote to find a true bill upon the evidence they have heard, while the allegations of the bill to which their sanction has apparently been given may present a totally different offense, and which, if

known to the grand jurors upon hearing the evidence, they would have ignored."

*Edwards, The Grand Jury, p. 155.*

In *Eubanks v. State*, 114 Pac. 748, it appears that witnesses, including members of the grand jury, were examined on the motions to quash, and it appeared from such evidence that the grand jury had never read the indictments and did not know what they charged except as the titles indicated, and did not vote on some out of a bunch of indictments found. The lower court overruled the motion to quash, and, on appeal, the Criminal Court of Appeals reversed the lower court, and after reviewing the case and authorities, say:

"The common law rule of secrecy has no place under the provisions of our criminal procedure, which recognizes personal constitutional right as superior to every other consideration, and, whenever it becomes essential to the ends of justice to ascertain what has occurred before a grand jury, it may be shown by the testimony of the grand jurors, and particularly whether or not a vote or ballot was taken showing the concurrence of the necessary number of grand jurors to find a true bill; the only limitation being that a grand juror will not be permitted to testify how any member of the jury voted or the opinion expressed by any of them upon any question during their investigations."

In *Ex Parte Bain*, 121 U. S. 1, this Court discharged upon *habeas corpus*, the petitioner for the reason that the indictment on which he had been tried and convicted, had been amended by the court after its finding by the grand jury. The grand jury being a part of the court, and under, at least to a considerable extent, the court's direction and control, and the indictments found by the grand jury being a part of the records and proceedings of the court, it is difficult to say on what theory the court discharged the petitioner on account of the amendment

to the indictment, unless it be that the amendment, not being in the words of the grand jury, could not be the act of the grand jury, and therefore, it was impossible for the court to amend an indictment, because in such amendment it was impossible to secure the concurrence of the grand jury. If this be so, it seems necessarily to follow, that it is equally necessary for the grand jury to be acquainted with the facts and contents of the indictment before it leaves its custody, and is delivered to the court. If the act of the district attorney and the court in amending an indictment vitiate it because such action renders it impossible to be the intelligent action of the grand jury, how can an indictment not read to a grand jury, with the contents of which the jury is unacquainted, be an indictment if it lacks the essential necessary to constitute a valid indictment, namely, the intelligent, independent and conscious action of the grand jury?

There having been some doubt as to the proper method of presenting the questions raised by the motion and plea, the rule varying in different districts, the defendant in this cause has presented the matters challenged, to the attention of the court both in the shape of motion and plea in abatement. Each District Court of the United States seems to have authority to mould to a large extent, its own practice in criminal affairs, and to follow to such extent, as it may desire, the practice of the local courts in which it is sitting. It is true now, as was said by Circuit Judge SWAYNE, in *United States v. Ambrose*, 3 Fed. 283, 285:

“It is proper to remark that the authorities upon the general subject as to how far an indicted party may go behind the indictment, as regards the action of the grand jury, or the questions he may raise, or the objections he may make, or what objections, if sustained, are fatal, or what are otherwise, are in utter confusion upon the subject.”

Some of the confusion mentioned, however, has disappeared. There is conflict and decided conflict, between the different courts as to the grounds on which they will set aside indictments. There is still confusion and conflict between the courts as to whether the proper method of attacking the indictments is by motions to quash or by pleas in abatement, or, an application for a rule to the court to file a motion or plea. But all modern cases now seem to recognize the fact that the mere finding of an indictment regular on its face and shown to be regular by the records of the court, does not prevent an attack on the indictment.

*Holt v. United States*, 218 U. S. 245, 247.

It is believed that the foregoing authorities clearly demonstrate that the power exists in the trial court, to quash the indictment by motion, or by plea in abatement, when the provisions of law requiring the finding of indictments to conform to certain standards have not been complied with. In no other way can the safety and security of the citizen be obtained. In no other way can constitutional and statutory requirements be enforced. If the mere finding and presentment of an indictment is to close all avenues of inquiry as to whether such indictment has been regularly found; if the presence of such indictment in the records of the court is to be a conclusive answer to an assault on the regularity of the proceedings; if such indictment is to have the conclusiveness of a record adjudication of the regularity of the proceedings preceding its finding, constitutional and statutory requirements and safeguards surrounding the organization of grand juries; the manner of its proceedings, and the manner in which indictments should be found, are but paper barriers and are worthless as a safeguard to the citizen, save in so far as they may be voluntarily complied with and conformed to by the prosecuting officers and members of the grand jury. Therefore, it seems to us, that the question sought to be raised by the motion and plea in abatement was raised in the only possible manner, and the demurrer of the United

States to them, admitting the state of facts, renders the only question to be decided by this court, whether the defect pled is of such a nature that the indictment should have been quashed. It seems to us upon the record that the indictment should have been quashed as otherwise there would be no security to citizens against unwarranted presentments.

### **PART III.**

#### **Demurrers.**

The indictment seeks to charge the defendant with having accepted and received concessions whereby property was transported in interstate commerce at less than the lawful rates, and, in certain counts, concessions whereby property was transported at less than the lawful rates and whereby a discrimination was procured by defendant in its favor as against another shipper.

Each count of the indictment was demurred to generally and the counts attempting to charge both a concession and a discrimination were demurred to specially as well, but as the matter urged on general demurrer goes to all the counts, so that if any ground of general demurrer is sustained it will be unnecessary to consider the ground of special demurrer, the grounds of general demurrer will be considered first. They are as follows:

- (a) The indictment fails to set forth facts from which the court is able to judge whether what occurred constitutes an offense against the United States, thus failing to meet a fundamental requirement of criminal pleading, in that said indictment simply following the language of the statute, charges the pleader's conclusion that defendant received a "concession."
- (b) The Elkins Act provides for punishment as a crime of shippers and carriers only, whereas the indict-

ment shows on its face that the defendant is neither.

- (c) The counts which attempt to charge acceptance of concessions during the period of federal control fail to charge an offense.
- (d) Counts 36 to 40 and 81 to 85, both inclusive, are double.

### PART III (a).

**All the counts of the indictment are insufficient in law, in that they wholly fail to state facts sufficient to show that an offense has been committed against the laws of the United States, and that they contain conclusions of the pleader instead of allegations of material facts, and therefore the demurrer should have been sustained.**

A host of authorities can be cited for, and none to the contrary of, the proposition that an indictment based on a statutory offense not an offense at common law will not be sufficient merely following the language of the statute, where the offense is one covered by a generic term or not described by words of art having a settled legal significance.

*Armour Packing Co. v. United States*, 209 U. S. 56, 83, 84.

*Evans v. United States* 153 U. S. 584, 587.

*United States v. Hess*, 124 U. S. 483, 486-489.

*United States v. Britton*, 107 U. S. 655, 668-670.

*United States v. Cruikshank*, 92 U. S. 542, 557-559.

*Ledbetter v. United States*, 170 U. S. 606, 609, 610.

*United States v. Bopp*, 230 Fed. Rep. 723, 726, 727.

*United States v. El Paso & N. E. R. Co.*, 178 Fed. Rep. 846.

*United States v. Brazeau*, 78 Fed. Rep. 464, 465.

Counsel for the Government in the Circuit Court of Appeals attempted to answer this ground with the oft-quoted generality about modern conditions having relieved the Government of the necessity of complying with impractical standards in pleading, but that is no answer to the authorities above cited.

The contention here made does not require any impractical standard of the Government, but merely that what it conceives to be an offense be stated not in legal conclusions but in plain facts, to which *the court* may apply *its* construction of the law to see whether an offense exists, rather than that the pleading shall rest merely on the *prosecutor's conception* of what constitutes an offense.

As has been stated over and over again by this Court, where "generic" terms are used in the statute, the indictment must descend to particulars, and in any case an indictment must contain "every element necessary to make up the offense."

It needs no argument to show that the word "concession" is a generic term. The decided cases under the Elkins Act embrace, as offenses coming within the term "concession," instances of free demurrage, collection at less than the lawful rate with or without a device, rebates with or without devices, extension of credit, and many other acts construed to be within the description "concession." It is manifest therefore that the word is a generic word, and, consequently, to meet the requirements of the cases in this respect it is not enough merely to use the language of the statute, but particulars of what transpired must instead be stated; that is, whether the defendant, by agreement with the carriers, simply in the first instance paid less than the lawful rate, or whether it paid the full legal rate and subsequently accepted a return of a portion thereof by the carrier, or whether it received something else of value in connection

with the transportation instead of money, the effect of which was a concession.

It will be observed that the indictment fails utterly to meet this requirement, and there is substantial reason why it is essential that it should do so. It is not only conceivable but, as will be demonstrated by an analysis of the *Lehigh Coal & Navigation Company case*, 250 U. S. 556, it is the fact that it was the Government's conception at the time these indictments were drawn of what would amount to a concession under the Elkins Act, that any departure from the rates, conscious or otherwise, would amount to such concession. Yet the case just mentioned squarely shows the error of this view.

The word "concession" is defined by the Standard Dictionary as "the act of conceding; or that which is conceded." Obviously, therefore, an "element" of a concession is the conscious voluntary conceding by the carrier to the shipper of some thing. If the carrier was defrauded by the shipper, this clearly would not be a concession. This is not saying that such fraud would not be punishable, as it of course would under section 10 of the Interstate Commerce Act (upon which charge another indictment is pending in the District Court), but it would not be punishable as a concession under the Elkins Act.

It is clear, therefore, that it is necessary, in order properly to plead the offense of concession under the Elkins Act, so that the court may see that the facts amount to such an offense, that the indictment show that the carrier consciously voluntarily conceded that which it is claimed the receipt of constituted a concession.

Here, the indictment not merely fails to aver that the carrier conceded anything, but it even fails to show what as a matter of fact it is intended to allege the defendant accepted. That the offense of a concession under the Elkins Act must embrace the element of conscious voluntary giving by the carrier does not rest upon the foregoing argument alone, is shown by an examination of the

reported cases construing the Elkins Act. In quite a number of such cases, the question was presented upon the construction of the words "knowingly and wilfully," and it will be found that in each such case the element of conscious giving by the carrier was present—sometimes in the shape of a rebate, sometimes under an express agreement to carry at less than the lawful rate, and sometimes by the devices set forth.

The following are excerpts from a number of cases construing the Elkins Act, and it will be found that this "element" is present in every one of such cases:

In *Lehigh Coal & Navigation Co. v. United States*, 250, U. S. 556, the court says:

"The questions asked depend upon the construction of the Elkins Act, as enacted in 1903 (32 Stat. 847), the relevant part of which is as follows: ' \* \* \* It shall be unlawful for any person, persons, or corporation to offer, grant, or give or to solicit, accept, or receive any rebate, concession, or discrimination in respect of the transportation of any property in interstate or foreign commerce by any common carrier subject to said act to regulate commerce and the acts amendatory thereto whereby any such property shall *by any device whatever be transported at a less rate than that named in the tariffs published and filed by such carrier* (italics ours) \* \* \*.' And under an amendment in 1906 (34 Stat. 584), an offender, 'whether carrier or shipper, who shall, knowingly, offer, grant, or give, or solicit, accept, or receive any such rebate, concession, or discrimination shall be deemed guilty of a misdemeanor.'

"The way to a correct construction of the act was to an extent cleared by the case of *Armour Packing Co. v. United States*, 209 U. S. 56. Its evolution was there detailed. It was said that carrier and shipper are charged with an equal responsibility and liability and that the act 'proceeded upon broad lines' to accomplish this equal-

ity, and 'that the only rate charged to any shipper for the same service under the same conditions should be the one established, published and posted as required by law.' And this was declared in various ways to be the test of obligation and liability and the 'form by which or the motive for which' its evasion or disregard is accomplished is not of modifying or determining consideration. It was in effect decided that the purpose of the statute took emphasis and meaning from the use of the word 'device,' and 'device' was defined to be 'anything which is a plan or contrivance' and is 'disassociated' from qualification and 'need not be necessarily fraudulent,' and by it the act sought 'to reach all means and methods by which the unlawful preference of rebate, concession, or discrimination is offered, granted, given or received.'

"It is in effect the contention of the Government that the language of the case exhausts definition and excludes the supposition of the questions of the Circuit Court of Appeals. We are unable to concur. The language of the case is easily explained by the question that was presented for decision. The Armour Packing Company contended that the act was directed only at fraudulent conduct, the obtaining of a rebate by some dishonest or underhand method, concession or discrimination. The language of the court was addressed to this contention and its selection and adequacy are manifest.

"No such contention is made in the case at bar and there are other distinguishing elements. It will be observed that by the statute and decisions the test of equality is the tariff rate. It was said in the opinion that it is 'the purpose of the act to punish those who give or receive transportation, in the sense of actual carriage, at a concession from the published rates' (*New York Central R. Co. v. United States*, 212 U. S. 500, 505). And such was the offense of the Armour Packing Company. There was no evasion of the tariff rate in the case at bar. The filed tariff indicated the existence and obligation of the 10th covenant of the

lease from the Company to the Railroad, that is, the fact of the allowance was declared, though it did not have the specification in figures. The tariff, of course, would have been more definite and complete with such specification, but its sufficiency was certainly believed in, for between 1906 and the date of the indictment it had 262 repetitions. The Company was given besides the assurance that it had the sanction of the Interstate Commerce Commission.

"There was no attempt at deception. The Commission knew by examination of the Company's books of the allowance and the amount of the allowance. Such, then, is the situation, and distinguishes the case from the *Armour Packing Company* case. There there was an omission to comply with the statute and the omission was attempted to be justified by honesty of motive and purpose; here there was compliance or attempted compliance with the statute—a tariff filed—and if a question could be raised upon its legal sufficiency the belief of the Company in its legality was supported by high authority and those circumstances can bring into action and exculpatory effect the provision of the statute which requires the acceptance of a rebate to be 'knowingly' done to incur the guilt of a misdemeanor. This conclusion gives no detrimental example against the efficacy of the law.

"We think this comment and conclusion enough to dispose of the questions asked and that there is no necessity to review the cases cited by the Company or the Government" (250 U. S. 562-565).

"The indictments in both cases were framed under Section 1 of the Elkins Act before it was amended, and it was held to be unnecessary to set forth the particular device by which the concession or rebate had been granted.

"Reference to the indictment in the case at bar shows that all of the allegations which were considered in the case last cited, as sufficient to sustain the indictment there under consideration, are present here, except the subsequent payment of the

rebate. *But, in lieu of that and in conformance with the facts, it alleges the charging and payment of a lower rate than that provided in the filed schedule or tariffs. The Elkins Act originally made a carrier who should offer, grant or give a rebate, concession or discrimination criminally responsible. This was amended by the Hepburn Act, so that the carrier, to be criminally liable, must knowingly, offer, grant or give a rebate or concession or discrimination."*

*United States v. Bunch, 165 Fed. Rep. 736, 740, 741.*

In *Atchison, T. & S. F. Ry. Co. v. United States*, 170 Fed. Rep. 250, there was involved an indictment on a charge of granting a concession. That case squarely holds that intent of the carrier is of the essence of the offense, and that any departure from its established rates must be wilful in order to constitute a crime. The

lower court was reversed expressly because of its having charged the jury, after striking out the evidence in relation thereto, that it was immaterial that the alleged departure was not intended as such, but consisted in an allowance with respect to alleged loss. The case repeatedly states that for a "departure" to amount to a concession, it must be so intended by the carrier.

In *United States v. P. Koenig Coal Co.* 1 Fed. (2d) 738, the precise question here under consideration was involved, and a demurrer sustained to an indictment charging a concession under the Elkins Act, where, as here, there were no facts pleaded upon which the Court could see that there was a conscious yielding or grant by the carrier. In his opinion, District Judge TUTTLE says (p. 740):

"The sole question, however, with which this court is now concerned is whether such conduct constitutes the acceptance or receipt of a 'concession' from a common carrier railroad, as denounced by the statute invoked by the government.

"It is an elementary rule of statutory construction that, in the absence of circumstances indicating otherwise, words used by a legislative tribunal in the enactment of a statute are to be considered as having been so used according to their usual, ordinary meaning.

"The common dictionary meaning of a 'concession' (as illustrated by the definitions in the Century and in Webster's International dictionaries) is 'the act of conceding or yielding, usually implying a demand, claim, or request,' 'a thing yielded,' 'a grant.'

"Now, nothing could be clearer than that, under the express allegations of the indictment involved, the advantage obtained is explicitly declared to have been received by the defendant from the carriers, not as a benefit yielded or consciously granted by them, but solely through and by means of deception practiced upon them by the defendant. The government charges in sub-

stance that the carriers were tricked by the defendant into transporting this coal, which they would not have done 'but for said device and deception.' To say, under these alleged circumstances, that the carriers thus imposed on by the defendant and fraudulently induced to transport this freight were thereby actually granting (although unknowingly) to the defendant a 'concession,' or that the defendant was thereby receiving from such carriers a 'concession', is, in my opinion, to do violence to the plain meaning of language and to fail to call things by their proper names. If an advantage obtained by such artifice and fraud be a *concession* accepted or received by the deceiver from his victim (and, therefore, necessarily granted or given, even although unknowingly, by the deceived), then the hobo who steals a ride on the 'bumpers' of a railroad car thereby receives and accepts a concession given him by such railroad, and the thief who picks the pocket of a conductor on a train knowingly accepts and receives a concession 'given' him, though not knowingly. I can perceive no real difference nor distinction in the underlying principles involved in the instances just suggested. In essence they seem to me to be the same. Although I am aware that in the only reported decision, so far as I can learn, involving this precise question (that of the District Judge in *United States v. Metropolitan Lumber Co.* (D. C.) 254 Fed. 335), a contrary opinion was reached, I am unable, after careful study of that decision, to approve or accept the conclusions there expressed. I cannot avoid the conviction that they embody, and are based upon, the reasoning to which I have already referred and with which I cannot agree.

"A careful reading of the Elkins Act leaves no doubt that its purpose was to punish and prevent the favoritism of shippers by common carriers in interstate commerce, and that, in order to more effectually accomplish this purpose Congress, after originally legislating against only the carriers who granted such favoritism, extended its prohibitions, so as to reach also the recipients of, and par-

ticipants in, such favoritism, namely, the shippers who, by knowingly accepting or receiving such unfair favors, promoted and made them possible. In the language of the report of the committee on interstate commerce in reporting the bill to the House (which report, of course, is entitled to consideration in the judicial construction of the statute), the committee believed that the Elkins Act, together with the Interstate Commerce Law then existing, covered about all possible means 'to prevent the granting of discriminations in favor of one shipper against another, or the building up of one concern through the favoritism of railroad corporations.'

"Nor is it without significance, as bearing upon the meaning of this statute, that an entirely different statute (section 10 of the Act of Feb. 4, 1887, c. 104, 24 Stat. 382, as amended [Comp. St. sec. 8574], expressly forbids the obtaining of various kinds of rebates by means of false statements, 'whether with or without the consent or connivance of the carrier,' being apparently intended by Congress to relate to an evil not also covered by any other statutory provision.

"In view of the considerations mentioned, and bearing in mind that the penal statute involved should be construed strictly, and limited to the plain meaning of the language used, I reach the conclusion that it cannot properly be so extended as to include within its prohibitions the conduct charged against the defendant by the indictment at bar.

"For the reasons stated, the demurrer must be sustained on the first ground therein presented, namely, that the acts alleged in the indictment do not constitute the offense charged. There is therefore no occasion to consider the objections urged to the validity of the service order involved. An order will be entered sustaining the demurrer."

It should be remembered in this action that the Government, throughout the trial and in summing up, in-

sisted that the defendant had defrauded the carriers in the transactions involved in the indictment, which insistence upon the part of the Government is itself assigned as error, and so found by the Circuit Court of Appeals.

Manifestly it cannot be consistently argued in one breath that the defendant deceived and defrauded the carriers, thereby obtaining an advantage, and in another breath that the defendant received a concession from a conscious yielding by the carriers.

The point made under this subdivision is that the indictment not only nowhere alleges facts, or even a conclusion, that the carrier voluntarily conceded that which it is claimed the defendant obtained; and facts are not even alleged that the defendant received anything—merely the bald conclusion of the pleader that it obtained a concession. There is no allegation that a certain rate was paid, and thereafter a refund of a portion of it made, or that a lower rate was collected than that legally applicable, or any other manner or form of concession described.

*United States v. Peterson, 1 Fed. (2d) 1018.*

### **PART III (b).**

**The Elkins Act provides for punishment as a crime of shippers and carriers only, whereas the indictment shows on its face that defendant is neither.**

The indictment, after setting forth the existence of the routes and rates, and the shipment by the Gypsy Oil Company of certain cars to the Gulf Refining Company at Port Arthur, then charges that freight charges in a certain amount (computed at the rate mentioned upon the weight of the shipment described):

“became due and payable and became a lawful debt and liability of the said Gulf Refining Com-

pany and payable to the said common carriers for the transportation."

There is not a word of explanation in the indictment as to why or how this sum "became a lawful debt and liability" of the said Gulf Refining Company, that being purely the pleader's conclusion.

The indictment clearly shows that the Gypsy Oil Company was the shipper of the substance shipped. It does not show or state under what conditions the substance was shipped, as to payment of freight, whether freight was prepaid; whether the freight was to be collected by the railway company from the consignee at the end of the shipment, is not stated as a fact. So far as any statement of fact in the indictment is concerned, it is silent. The facts as pled in the indictment, show a legal duty and obligation resting upon the Gypsy Oil Company to the railroad company for the payment of the freight. There was no contractual relation between the Gulf Refining Company and the railroad. What, if any, liability could attach to the Gulf Refining Company for freight on such shipments, is left to conjecture. The pleader attempts to cure this. It is sought to be covered by the above quotation, which is certainly a conclusion of the pleader and not the statement of facts upon which such conclusion rests. It is evident (1) that so far as the statute itself embraces liability for freight as a matter of law, such liability is imposed upon the shipper and not the consignee. The shipper makes the contract of shipment, not the consignee. The mere shipment of freight, whether accepted or not, would create a liability on the part of the shipper to the carrier of freight. No such liability could rest on the consignee unless goods shipped were shipped with freight collect, and his acceptance of the goods would thereby raise an implied agreement on his part to pay. Again, if the goods were shipped with freight unpaid,

the carrier would have a lien on the goods for his freight and other charges, and the surrender by the carrier of such goods, to the consignee, and the consequent loss of his lien on the goods, would create a liability on the part of the consignee to pay, which would be supported by the consideration that the consignee received the goods and the carrier had lost his lien. No facts are stated in the indictment which would raise such a condition. Outside of the general conclusion of the pleader, no fact is stated which shows liability on the part of the Gulf Refining Company. Outside of the conclusion of the pleader, there is nothing from which anyone can conclude any legal liability on the part of the Gulf Refining Company; nothing that negatives the idea of the primary liability of the shipper, in this case, the Gypsy Oil Company; nothing that negatives a presumption that the goods were shipped freight prepaid. The words, "became a lawful debt and liability" are so evidently a conclusion, that it is scarcely worth while to argue that it is not a statement of fact. It is not for the pleader to determine whether the freight "became a lawful debt and liability" of the Gulf Refining Company, but the indictment to be good must state such facts as will enable the court on an inspection of it, to say as a matter of law, that on the facts so stated the freight mentioned in the indictment "became a lawful debt and liability."

(2) Again, we contend that the indictment in this case should have been quashed for the reason it clearly appears on the face of the indictment, that Gypsy Oil Company is the shipper and the Gulf Refining Company the consignee, and, under the Act of February 19, 1903, as amended by the Act of June 29, 1906, it is the shipper and the carrier that can be indicted, and only these persons, under the circumstances stated in the indictment.

We think this is evident from the language of the two acts and therefore set them out so far as the same

are here relevant. The Act of February 19, 1903, 32 Statutes at Large, 847, provides:

“and it shall be unlawful for any person, persons, or corporation to offer, grant, or give, or to solicit, accept or receive, any rebate, concession or discrimination in respect of the transportation of any property in interstate or foreign commerce, by any common carrier, subject to said Act to Regulate Commerce and the acts amendatory thereto, whereby any such property shall by any device whatever, be transported at a less rate than that named in the tariffs published and filed by such carrier, as is required by said act to regulate commerce and acts amendatory thereto; or, whereby any other advantage is given, or discrimination is practiced. Every person or corporation who shall offer, grant or give, or solicit, accept or receive any such rebates, concessions or discrimination, shall be deemed guilty of a misdemeanor and on conviction thereof shall be punished by a fine of not less than \$1000.00 or more than \$20,000.00.”

It will be seen from the above statute that every person, etc., that had anything to do with the unlawful transaction, were made subject to indictment. The Act of June 29, 1906, 34 Statutes at Large, 584, commencing at the bottom of page 587, provides as follows:

“and it shall be unlawful for any person, persons, or corporation, to offer, grant, or give, or to solicit, accept, or receive, any rebate, concession or discrimination in respect of the transportation of any property in interstate or foreign commerce by any common carrier subject to said Act to Regulate Commerce and the acts amendatory thereof, whereby any such property shall by any device whatever be transported at a less rate than that named in the tariffs published and filed by such carrier as is required by said Act to Regulate Commerce and the acts amendatory thereof, or whereby any advantage is given or discrimination

practiced. Every person or corporation, whether carrier or shipper, who shall knowingly offer, grant, or give, or solicit, accept, or receive, any such rebates, concession, or discrimination, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine of not less than \$1000.00 or more than \$20,000.00."

It will be noticed that the only difference in this act and the Act of February 19, 1903, is that where the Act of February 19, 1903, uses the word "thereto," the above act uses the word "thereof," and in the portion of the act defining the misdemeanor, the above statute inserts the words "whether carrier or shipper," and the word "knowingly," so it seems evident that there could be but two purposes that Congress had in view in the amendment last above cited, for with the exceptions above named, the two acts are identical. The purposes intended to be wrought by this amendment, it seems to us, are two: (a) First, the act denounced as criminal, must be knowingly committed; and (b) the words "whether carrier or shipper" could have been inserted for only one purpose, and that was to limit the generality of the language preceding such words and limit the generality of the act it amends. The words immediately preceding "whether carrier or shipper," are broad enough to embrace every person who could by any possibility have any connection with the transaction, for they are sufficiently broad to include every person, natural or artificial in being. Therefore, the words "whether carrier or shipper" could not have been introduced for the purpose of making more general or more embracing, the preceding portion of the statute. Therefore, it follows that they must have been introduced for the purpose of limiting the class who could be guilty of a misdemeanor. Before defining the misdemeanor, the act just cited, as well as the act which it amends, declares without limitation that it shall be unlawful for any per-

son, persons, or corporation to do any of certain specified acts, but this generality is limited when it comes to define and set out and make criminal the act declared to be unlawful. This seems to us to be not without reason. The acts merely declared to be unlawful, are necessary for the protection of the public, and those acts so declared to be unlawful, can, in proper cases, be enjoined by the court in the exercise of its equitable powers. They may be the basis for an action for the recovery of damages, an action for reparation, but when it comes to define the crime, then Congress, it seems to us, has wisely limited the crime to the two persons who ordinarily could be the only persons guilty—the shipper and the carrier.

*Tucker v. St. Louis-San Francisco Co.*, 233 S. W. Rep., 512.

### PART III (c).

**Counts 36 to 40, inclusive, 65 to 80, inclusive, and 80 to 100, inclusive, of the indictment, covering shipments during federal control, are bad both in pleading and in substance.**

The above-numbered counts all relate to shipments transported during federal control. It is contended under this point that they are bad as matter of pleading in alleging that the named carriers had published and filed the rates alleged to have been in effect, and had performed the transportation, and that the defendant had accepted and received concessions from said named carriers, instead of alleging that the rates had been published, or at least adopted by the Director General or the United States, that the transportation had been performed by him, and the concession obtained from him.

It is also contended that the Elkins Act had no application to shipments transported during federal con-

trol, and that consequently the counts are bad in substance as well.

The counts are substantially similar, except that certain of them, in addition to attempting to charge concessions, also attempt to charge discrimination, both in violation of the Elkins Act.

By reference to the first of these counts, 36 (*Rec.*, p. 53), it will be observed that it charges that on and prior to December 28, 1917, the Midland Valley, the Kansas City Southern and the Texarkana & Fort Smith railway companies were each corporations and

“operated connecting railway routes and were common carriers engaged in the transportation of property, including gasoline, for hire over their connecting railway route,” etc.,

from Kiefer, Oklahoma, to Port Arthur, Texas, and so subject to the Act to Regulate Commerce (II); that on December 26, 1917, the President, by proclamation, assumed

“control of certain systems of railway transportation, including the railway routes of the three common carriers aforesaid, and did in said proclamation direct that the control, operation and utilization of such transportation systems should be exercised by and through the Director General”,

and that from December 28, 1917, to June 1, 1918,

“said railway routes and lines of transportation of the three said common carriers were controlled, operated and utilized by the Director General of Railroads, which control, operation and utilization is herein termed federal control”. (III).

That from January 1st to June 1st

“said three common carriers under federal control had printed and had filed with the Interstate

Commerce Commission of the United States, and had published, schedules and tariffs of rates and charges \* \* \* which showed that the lawfully established rate for the transportation of gasoline"

from Kiefer

"over the aforesaid connecting through railway route"

to said Port Arthur, was 33 cents for each 100 pounds. (IV). That throughout said period the Texas Company was engaged in shipping gasoline from Kiefer over the aforesaid through railway route to Port Arthur, and at divers times did ship large quantities of gasoline from Kiefer to Port Arthur

"at the said lawfully established rate of thirty-three cents per hundred pounds"; (V).

That during said period, on January 25th

"and while the aforesaid schedules and tariffs of rates and charges were in force and effect,"

the Gypsy Oil Company, at Kiefer,

"did deliver to the said common carriers under federal control, for transportation, a large quantity of gasoline,"

etc., and that pursuant to instructions given by it

"the said common carriers under federal control did transport said gasoline in said tank cars over the aforesaid through railway route," etc.; "that thereupon freight charges in the amount of \$1,760.19, at the aforesaid lawfully established rate of thirty-three cents for each 100 pounds thereof, became payable and became a lawful debt and liability of said Gulf Refining Company, payable to said common carriers under federal control, for the transportation", etc. (VI).

That on February 21, 1918, said Gulf Refining Company  
 “unlawfully did knowingly accept and receive  
 from the said common carriers under federal control a concession in respect to the transportation of the last mentioned shipment \* \* \* and whereby a discrimination was practiced in favor of said Gulf Refining Company,” etc. (VII).

It will be observed that throughout the count attempts to charge that the rates claimed to be the legal rates were published, printed and filed by

“said three common carriers under federal control”;

that the transportation was performed by them, and that the alleged concession was received from them in the face of the fact that it charges in the third paragraph that their properties were under federal control and were operated by the Director General. The phrase “under federal control” does not help the expression. It cannot refer to the Director General, for he could not be *three* common carriers. The second paragraph distinctly describes the corporations as being common carriers, and names three of them, and they are the only persons referred to or described as common carriers. The expression “common carriers under federal control”, used in the indictment, was undoubtedly taken from that expression as used in the Federal Control Act (March 21, 1918; Chap. 25, 40 Stat. L. 451; Comp. Stat., Sec. 3115  $\frac{3}{4}$ a; Fed. Stat. Ann. Supp. 1918, p. 757).

As this Court said in *E. I. Dupont de Nemours & Co., Pet’r. v. James C. Davis, Director General*, etc., 264 U. S. 456, decided April 7, 1924, 68 L. Ed. 788, that statute

“repeatedly recognizes a distinction between the President—including, of course, the Director

General—and the carriers. The first section itself limits the meaning of the word ‘carriers’ to railroads and systems of transportation which, as carriers, had been taken over by the President. Accurately speaking, the Director General was not a carrier, but an operator of carriers. The distinction to which we have referred constantly appears in the provisions of the act, as, for example: ‘The President may, nevertheless, pay to any carrier while under Federal control an annual amount,’ etc., Sec. 2; ‘On the application of the President or of any carrier,’ etc., Sec. 3; ‘Carriers while under Federal control shall be subject to all laws and liabilities as common carriers,’ etc., Sec. 10; ‘Actions at law or suits in equity may be brought by and against said carriers,’ etc., Sec. 10; ‘Moneys and other property derived from the operation of the carriers during Federal control are hereby declared to be the property of the United States,’ Sec. 12.”

As this Court has so definitely held that the expression “carriers under Federal control” does not mean the Director General, it follows that the pleading of the indictment in these counts is quite erroneous. Assuming, though not conceding, that a charge of obtaining a concession or discrimination might properly lie during federal control, it follows that it would be necessary for the indictment to allege that the United States or the Director General had published and filed the rates—or adopted those theretofore published and filed by the carriers—and that the concession had been obtained from the United States or the Director General.

Apart from the question of pleading, it is also contended here that the Elkins Act had no application to transactions during federal control. This both by the letter of the statute and in reason.

The Elkins Act (32 Stat. L. 847), as amended by the Act of June 29, 1906 (34 Stat. L. 584), provides that

"it shall be unlawful for any person, persons, or corporation, to offer, grant or give, or to solicit, accept, or receive any rebate, concession or discrimination in respect to the transportation of any property in interstate or foreign commerce by any common carrier subject to said Act to regulate commerce \* \* \*."

Clearly the United States, acting as it did in its sovereign capacity, cannot be said to be a common carrier.

In the *Dupont case*, *supra*, this Court said:

"In taking over and operating the railroad systems of the country the United States did so in its sovereign capacity, as a war measure, 'under a right in the nature of eminent domain' (North Carolina R. Co. v. Lee, 260 U. S. 16, 67 L. ed. 104; Missouri P. R. Co. v. Ault, 256 U. S. 554, 65 L. ed. 1087; Northern P. R. Co. v. North Dakota, 250 U. S. 135, 63 L. ed. 897; Re Tide Water Coal Exchange, 280 Fed. 648, 649); and it may not be held to have waived any sovereign right or privilege unless plainly so provided." (68 L. Ed. 791).

See, also:

*Northern Pacific Ry. Co. v. North Dakota*, 250 U. S. 135.

In the *Dupont case*, *supra*, it was contended that the Director General was a common carrier subject to the Act, and as such barred by the three-year statute of limitations contained in Section 16 of the Interstate Commerce Act, reading:

"All actions at law by carriers subject to this Act for recovery of freight charges or any part thereof shall be begun within three years from the time the cause of action accrues, and not after."

In its opinion, this Court said:

"It is insisted that the United States—by the Director General representing the United States—is included in the provision as a carrier subject to the Act. Our opinion is otherwise."

It is difficult to give a general definition of the term common carrier without including within the definition certain duties of, and the rules of law applicable to the transaction of the business. It may be defined, generally, however, as one who engages to transport for hire from place to place goods of such persons as choose to employ him, and its distinctive characteristic is that the undertaking is to carry for all persons indifferently the goods he is accustomed to carry and, therefore, in some measure is considered as a public servant.

In *The Niagara v. Cordes*, 21 Howard 7, 16 L. ed. 46, this Court defines the term as follows:

"A common carrier is one who undertakes for hire to transport the goods of those who may choose to employ him, from place to place. He is, in general, bound to take the goods of all who offer, unless his complement for the trip is full, or the goods be of such a kind as to be liable to extraordinary danger, or such as he is unaccustomed to convey."

In *The Cape Charles*, 198 Fed. 346, at page 349, defining a common carrier, the court says:

"The distinction which marks a common from private carrier is clearly defined. A common carrier is one who openly professes to carry for hire the goods of all such persons as may choose to employ him. Redman's Law of Railway Carriers (2d ed., 1880) 1. In some cases it is said that the test whether one comes within the definition of a common carrier is whether he holds himself out to carry goods for every one who applies to him.

SIMPSON, C. J., says: 'The true test of the character of the party, as to the fact whether he is a common carrier or not, is his legal duty and obligation with reference to transportation. Is it optional with him whether he will or will not carry for all? If it is his legal duty to carry for all alike who comply with the terms as to freight, etc., then he is a common carrier, and is subject to all those stringent rules which, for wise ends, have long since been adopted and uniformly enforced, both in England and in all the states, upon common carriers.' *Piedmont Mfg. Co. v. Columbia etc. R. Co.*, 19 S. C. 353; 16 Am. & Eng. R. R. Cas. 194. A private carrier is one who, without being engaged in such business as a public employment, undertakes to deliver goods in a particular case for hire or reward. *Pennewill v. Cullen*, 5 Har. (Del.) 238."

In *Woods Railway Law*, page 563, section 195, it is said:

"At common law *every common carrier is bound to receive goods from all persons alike without making any personal distinction, without giving any unjust or unreasonable advantage by way of facilities for the carriage or rates for transporting them*, and statutes prohibiting discrimination are held as merely confirmatory of the common law."

In 6 *Cyc* 372, it is said:

"Common carriers owe to the public the duty of carrying *indifferently for all who may employ them and in the order in which the application is made and without discrimination as to terms.*"

In *Mershon et al. v. Hobensack*, 22 N. J. Law 372, the court says:

"Every person who undertakes to carry for compensation the goods of *all persons indifferently is a common carrier.*"

In *Maslin v. Baltimore etc. Ry. Company*, 14 W. Va. 180, at page 188, the common carrier is defined as follows:

“One who undertakes for hire to carry from place to place the goods of all persons indifferently.”

In *Hutchinson on Carriers*, section 47, the definition is as follows:

“One who undertakes as a business, for hire or reward to carry from one place to another the goods of all persons who may apply for such carriage.”

In *Watkins on Shipments and Carriers*, (3rd ed.) volume 1, section 36, page 220, it is said:

“It is axiomatic that a common carrier is not at liberty to accept or decline shipments or to accept or decline passengers.”

In the same volume, section 61, page 275, it is said:

“The duty of a common carrier to transport, at reasonable rates, exists at common law. This was, and is, true because the business of carriage for the public is of a quasi-public nature and the charges therefor are subject to the regulation by the public.”

To the same effect see:

*Gisbourn v. Hurst*, 1 Salk. 249, 91 Rep. 220;  
*Orange Bank v. Brown*, 3 Wend (N. Y.) 158;  
*Jackson Architectural Iron Works v. Hurlbut*,  
 158 N. Y. 34, 38, 52 N. E. 665;  
*The Huntress*, 12 Fed. Cases No. 6914;  
*2nd Chitty's Blackstone*, (Am. ed 1830) 451  
 Note 22;  
*1st Leigh*, N. P. 507.

Authorities to like effect could be multiplied indefinitely, but we assume multiplication to be unnecessary.

It necessarily and conclusively follows from the above and foregoing authorities that the term common carrier means one who operates an instrumentality of transportation, who possesses certain characteristics and on whom the law imposes certain duties and casts certain obligations which inhere in the very definition of the term and in the very nature of the business. That these duties and obligations are imposed under a sanction, and chief among such duties and obligations is that to transport for all without preference, and to receive, transport and deliver goods, without discrimination as to facilities, and the absence of these distinguishing features, the legal power to disregard and hold for naught such duties and obligations inhering in the very nature and character of the business must destroy, and, of necessity, does destroy, the character of a carrier as being a common carrier. Carriage cannot be said to be *common when the carrier possesses the power of selection; it cannot be said to be indifferent when the power of preference and precedence exists; it cannot be said to be obligatory when the power of denial or election exists; yet, in the transportation of property over the railroad systems under federal control, the United States possesses the power of selection, the power to transport for one and deny transportation to another; the power of preference and precedence exists as to such states in transporting property, and, therefore, in no just sense of the term can the United States in the control of the railway systems of the country be said to be a common carrier.*

Again, the very circumstances under which the United States assumed control of the railroads and the purposes sought to be accomplished thereby are such as of necessity preclude the idea that *it assumed the duties and obligations of a common carrier, for the chief reason, if not the sole reason of such assumption, was to free trans-*

portation of the hampering fetters, restrictions and obligations inhering in the very nature of the business of a common carrier, and to permit transportation to be had without reference to such trammels, and the exercise of the general right of transportation freed from such restrictions was considered a power too great, a power too susceptible of abuse, too fraught with possibilities of evil to be entrusted even to persons of quasi-public character *and could only safely be confided to and exercised by the federal government*. These reasons account for the federal control acts and why the government was directly put in operation of the railroads and the railroad companies not permitted to operate the railroads under governmental direction.

To hold that in the assumption of control of railroads and the transportation of goods, etc., over them, the government is a common carrier, is, it seems to us, by judicial ukase, to defeat the legislative purpose and destroy the congressional intent in conferring such power. *For the very purpose of the assumption, the obvious necessity of federal control was to free the transportation systems from the hampering and fettering duties and obligations of common carriers and permit the government to carry on the business of transportation freed of the restraints that were "harassing but unavoidable"* so long as such systems were operated by private enterprise and under control of private corporations; was to give the United States the absolute, unlimited and unfettered right to operate and use such systems, not only for the purpose of transporting troops, munitions and war equipment and material, *but to give priorities to private shippers who were only remotely, if at all, connected with the government, and indeed to prohibit certain freight movements entirely*. To regulate and control shipments so the necessities of different communities could be supplied without material interference with the desire, if not the absolute duty of supplying the necessities of our allies.

The United States acquired the right of possession and control of the country's transportation systems under and by virtue of the Acts of Congress of August 29, 1916, and of March 21, 1918. The purpose of each act being, as they on their face disclose, to confer such power as a war measure and at the time of taking possession and control, December 28, 1917, the United States was actually engaged in war and the acts are war measures and their validity rests and depends upon the war powers of the government. This is apparent from an inspection of the acts and is so declared by the courts. In *Northern Pacific Railway Company v. North Dakota*, 250 U. S. 135, at page 149, the court says:

"On the face of the statutes it is manifest that they were in terms based upon the war power, *since the authority they gave arose only because of the existence of war*, and the right to exert such authority was to *cease upon the war's termination*. To interpret, therefore, the exercise of the power by a presumption of the continuance of a state power limiting and controlling the national authority was but to deny its existence. It was akin to the contention that the supreme right to raise armies and use them in case of war did not extend to directing where and when they should be used."

The Act of August 29, 1916, authorizes the President in time of war "to take possession and assume control of any system or systems of transportation, or any part thereof, and to utilize the same *to the exclusion, as far as may be necessary, of all other traffic thereon*, for the transfer or transportation of troops, war material and equipment, *or such other purposes connected with the emergency as may be needful or desirable*." This, in effect, makes the United States through its President the sole arbiter of the use of said systems for he, and he alone, is the sole and supreme judge of whether the use or purpose to which the systems are put is "connected with the

emergency". The President and the Director General alone determine whether the use or purpose "connected with the emergency" to which the systems are put, is a purpose or use that is or "may be needful or desirable". His discretion, his judgment in such regard being the sole criterion, his control is absolute. Perfect freedom of action is conferred, except as restrained by his judgment as to what "may be needful or desirable". He is not compelled as a public agent to give "equal treatment to all". Under this grant of power in regard to the act to regulate commerce, he can "set" all "its provisions at naught" as he has done some of its provisions by Order No. 1, dated December 29, of the Director General, wherein it is ordered:

"The designation of routes by shippers is to be disregarded when speed and efficiency of transportation service may be thus prompted."

This order confers upon "subordinate agencies" the power to abrogate and "set at naught" paragraph 8 of section 15 of the act to regulate commerce wherein the right of selection and determination of routes "in all cases" is conferred on the shipper and compliance with the shippers' designation made mandatory on the carrier. Such a carrier "engaged in Interstate Commerce" is not "subject to the commands of the statute" regulating commerce, and, therefore, falls without the statutory definition of "common carrier, subject to this act."

Again, we have the same result by reason of the authority to exclude, as far as necessary, all traffic other than that directly relating to the war and to give priority to certain shipments, the power thus given being absolute, subject to no regulatory law.

By the Act of March 21, 1918, Congress states that the President had "in time of war taken over the possession, use, control and operation of certain railroads and systems of transportation" and the assumption of such con-

trol is ratified. (Section 1.) The control thus assumed by the President and ratified by Congress was absolute and unhampered by any legislative regulatory measures. In his proclamation of December 26, 1917, the President stated that he takes possession and assumes control of the systems in order that the systems "be utilized for the transportation of troops, war material and equipment to the exclusion, as far as may be necessary, of all other traffic". In and by the proclamation, a Director General was appointed to exercise all the powers of the President under the act. The proclamation retained and asserted the unlimited power conferred by Congress by expressly providing that the Director General might, at any time, by general or special order, change in any respect the existing order of things, and providing that "any orders, general or special, hereafter made by the Director General, shall have paramount authority and be obeyed as such", notwithstanding any existing statute or orders to the contrary.

The first eight sections of the Act of March 21, 1918, provide for the payment of just compensation to the owners of the systems of transportation taken under federal control, and all earnings of the railroads while under federal control are declared to be the property of the United States. Except as modified and restricted by the Act of March 21, 1918, the Act of August 29, 1916, is continued in full force and effect by section 9 of the Act of March 21, 1918, and in addition to the powers conferred on the President by the act, he is given "such other and further powers necessary or appropriate to give effect to the powers herein and heretofore conferred." It is thus readily seen that the power so conferred upon the President in the control and operation of such systems is absolute and unlimited.

The principal purpose of these acts was to enable the doing by the President of the very things which the Act

to Regulate Commerce and the Elkins Act intended specifically to prohibit the corporate common carriers from doing.

The Act to Regulate Commerce requires the publication and filing of tariffs to be done on thirty days' notice. The Federal Control Act authorizes it to be done whenever the President sees fit, and denies to the Interstate Commerce Commission the right to suspend such. The Elkins Act prohibits preferences and discriminations; the Federal Control Act expressly authorizes the granting of priorities and preferences.

It is a matter of common knowledge that during federal control priority in shipment was accorded the traffic of hundreds of individual shippers, which, if the Interstate Commerce Act was in effect, would have been directly contrary thereto; no one would have the hardihood to claim that the Director General of Railroads (or the President, whose agent he was) would be indictable therefor, and it would be quite as absurd to conclude that though the agents of the sovereign might lawfully give, the recipient would commit a crime in accepting.

It would seem to be clear that the United States was "neither a common carrier" nor "subject to said Act to Regulate Commerce", and consequently not within the language of the Elkins Act. It is not a question whether Congress might have so amended the Act as to bring the obtaining of concessions during federal control within the provisions of Section 10, for instance, of the Interstate Commerce Act, for this it did not do.

As said by this Court in *United States v. Bathgate*, 246 U. S. 220, 225:

"Our concern is not with the power of Congress but with the proper interpretation of an action taken by it. This must be ascertained in view of the settled rule that 'there can be no constructive offenses and before a man can be punished his case must be plainly and unmistak-

ably within the statute.' (U. S. v. Lascher, 134 U. S. 624, 628)."

*McCoy v. Pacific Spruce Corpn.*, 1 Fed. (2d) 853.

It should also be noted that certain counts are either repugnant or uncertain in the averments of time. Paragraph II of count 65, which is by reference incorporated in counts 66 to 80 and of count 86, which is incorporated in counts 87 to 100, inclusive, each begin with an averment "That on December 28, 1917, and prior thereto" certain named railroad companies were common carriers operating through routes and that on that date the President assumed control, exercising it through the Director General and "that throughout the aforesaid period of time" the routes were operated for transportation of gasoline for hire, but all the remaining averments of these counts deal with periods of time *subsequent* to December 28, 1917, instead of prior thereto.

### PART III (d).

#### Special Demurrer. (Assignments of Error IV and CXVIII [5].)

The special demurrer points out that counts numbered 36, 37, 38, 39, 40, 81, 82, 83, 84 and 85, are all double.

These counts charge accepting a concession whereby property was transported at less than the lawful rate and whereby a discrimination was practiced.

The statute provides that

"it shall be unlawful for any person \* \* \* to accept \* \* \* any rebate, concession or discrimination in respect of the transportation of any property in interstate or foreign commerce \* \* \* whereby any such property shall, by any device

whatever, be transported at a less rate than that named in the tariffs published and filed \* \* \* or whereby any other advantage is given or discrimination is practiced."

It is quite clear that the acceptance of a rebate or concession whereby property is transported at less than the lawful rate is one offense, and the acceptance thereof whereby an advantage is given and discrimination practiced is another offense.

Indeed, this same act provides, aside from the criminal penalties, forfeitures to the United States of treble the amount of concessions consisting in departures from the rates, which provision does not apply to concessions merely discriminatory.

A discrimination might occur without any departure from the rates. For example, the cases involving extension of unlimited credit to a particular shipper, discriminatory car distribution, occupancy of land belonging to carriers, and many other forms of discrimination not involving departure from the rate.

On the other hand, a departure from the rate may often occur without any discrimination occurring. It is obvious that before there can be discrimination there must be another shipper shipping contemporaneously. Yet the case may readily be where there is no such other shipper, and although there may be a departure from the rate, there is in such case no discrimination.

Here, however, the vice of duplicity is pointedly present, as the indictment not merely in the charging part charges the two offenses, but in the inducement it lays out both the existence of the tariff rates, from which it is alleged the concession was made, and the fact of another shipper shipping coincidentally. So that by every test the two complete crimes are attempted to be charged in these counts.

*United States v. Norton*, 188 Fed. Rep. 256, 259, 261.

*Ammerman v. United States*, 216 Fed. Rep. 326, 329.

*United States v. Morse*, 161 Fed. Rep. 429, 437.

*United States v. Smith*, 152 Fed. Rep. 542, 545, 546.

*United States v. Taylor*, 108 Fed. Rep. 621.

*United States v. Patty*, 2 Fed. Rep. 664.

#### PART IV.

##### Errors Occurring on the Trial.

#### PART IV (a).

Assignments of Error VI (*Rec.*, p. 1543), denial of defendant's motion to instruct a verdict of acquittal upon the admissions of the Government's opening statement (*Bill of Exceptions, Rec.*, pp. 170-175); LXXXII (*Rec.*, pp. 1645, 1646), denial of defendant's motion at the close of the evidence to instruct a verdict of acquittal (*B. of E., Rec.*, pp. 899-901); CXVII (13, 14 & 15) (*Rec.*, pp. 1662, 1663), denial of motion to set aside the verdict (*B. of E., Rec.*, pp. 934-947); CXVII (5) (*Rec.*, p. 1665), denial of motion in arrest of judgment (*B. of E., Rec.*, p. 166).

It is considered the Court erred in denying these motions, because:

(1) It is a scientific fact, of which the court has judicial knowledge, that the liquid condensate of casing-head gas (unblended or blended as shipped to defendant) is not gasoline, but, on the other hand, is appropriately described as unrefined naphtha;

(2) The opening statement of the Government admitted, and the undisputed evidence showed, that the material shipped was not gasoline, as alleged in the indictment, but liquid condensate of casinghead gas, resulting in a fatal variance between the charge and the proof;

(3) The Government's opening statement and the proof showed a controversy as to the proper construction of tariffs, thus ousting the court of jurisdiction, because jurisdiction to construe tariffs is exclusively confided in the Interstate Commerce Commission under the Act to Regulate Commerce and decisions of this Court thereon.

- (1) ***It is a scientific fact, of which the court has judicial knowledge, that the liquid condensate of casinghead gas (unblended or blended as shipped to defendant) is not gasoline, but, on the other hand, is appropriately described as unrefined naphtha.***

Courts take judicial notice of notorious facts concerning commerce, industry, history, natural science and the meaning of words.

4 *Wigmore on Evidence* (2nd ed.), Secs. 2580, 2582.

Instances of this character are "that natural gas no longer exists in quantities sufficient for heating purposes in Indianapolis" (*State v. Indianapolis Gas Co.*, 163 Ind. 48); that Texas cattle fever "is contagious" (*Dorr Cattle Co. v. C. H. W. R. Co.*, 128 Ia. 359); sundry facts about the "burning of wool" (*Sun Ins. Office v. Western W. M. Co.*, 72 Kan. 41); "explosion of oil" (*Waters-Pierce Oil Co. v. Deselms*, 212 U. S. 159); the meaning of "retail liquor dealer" (*State v. Nippert*, 74 Kan. 371); the meaning of "temperance beer" (*State v. Durr*, 69 W. Va. 251); the characteristics of "whiskey, gin, brandy, wine," etc.

4 *Wigmore on Evidence* (2nd ed.), Sec. 2582 and notes.

The meaning of ordinary words is not a matter for testimony, but rather a matter for the court.

3 *Wigmore on Evidence* (2nd ed.), Sec. 1955 a-1.

It would be difficult to conceive of a commodity more common in use or in commerce than is gasoline. There is an abundance of testimony in the record, and it is hardly disputed, that gasoline as commonly understood is a liquid suitable for use by vaporization, such as running a motor car, gasoline launches, stoves, etc. Even the Government's own witness lapsed into the expression "ordinary gasoline" to distinguish it from the wider range of material he attempted to embrace within that term (*Rec.*, p. 447).

Counsel for the Government in his opening statement was impelled to say to the jury:

"Now it will be observed that the indictment charges that what was shipped was gasoline. Now as it is a common knowledge there are two kinds of gasoline, that which is usually refined as crude oil in a refinery, and the other is casinghead gasoline made by the compression of gas escaping from an oil well." (*Rec.*, p. 171).

There is no pretense whatever that the material shipped is this material commonly known as gasoline. What the Government does claim, however, is that what is ordinarily known as gasoline is only one kind of gasoline, that there are other kinds of gasoline, and that this material is one such other kind; and its experts testified substantially to that effect. On the other hand, the defendant's experts all testified that the application of the name "gasoline" to this material is improper; that in no proper sense of the word "gasoline" would it be embraced, and that the name "casinghead gasoline" does not denote a kind of gasoline, but is a compound name, just as are quicksilver, isinglass, applebutter, nearbeer, etc.

We concede that there are various kinds of gasoline, such as motor gasoline, gas machine gasoline, stove gasoline, etc. The fallacy of the Government's

experts' position however is that they attempt to denominate as a kind within the class gasoline, unfinished gasoline material that is in fact not yet gasoline but destined to become one of the kinds of gasoline embraced within the general class gasoline. +

However, all the experts, both the Government's and defendant's, agree that "naphtha" is also a proper name of this material, as well as of the material ordinarily known as gasoline. In fact, Government counsel was ultimately compelled to concede that the material is embraced within the name "naphtha," and one of the Government experts, in an effort to make his testimony consistent, took the position that "gasoline" and "naphtha" were interchangeable names for all the products of the lighter hydrocarbons of petroleum above kerosene, technically known as those embraced within the naphtha fraction (*Rec.*, pp. 865, 866).

Under these circumstances, the question resolves itself not into whether "gasoline" or "naphtha" is the proper name, but rather as to the propriety of the term "unrefined" as a prefix to either name.

If the proposition is sound that it is a matter of judicial knowledge that the material in question is unrefined naphtha, the court is of course not controlled by the evidence, but may readily look to it to refresh its knowledge. The position of the Government's experts was that the material could not properly be denominated "unrefined" because they claim that the material was "refined" in the sense in which they use that word as synonymous with "pure," in that they claim it was free of impurities. On the other hand, they admit that it was not finished (at the time of shipment) to the extent gasoline is customarily finished for ordinary consumption. They further admit that it is frequently a practice to send such material to a refinery for finishing, consisting in the correction of its boiling points, x

generally done by blending (*Rec.*, pp. 833, 834, 840, 853, 854, 884-886).

X The evidence shows beyond controversy that this material was taken to Port Arthur expressly for that purpose, and that every gallon of it was further processed either by blending or distillation. But the Government then shifts to the position that blending is not refining. This then brings the controversy down to the question of the meaning of the words "unrefined" and "refining." If these words are to be construed by their ordinary meaning, it is, as above pointed out, a matter for the court, based on its knowledge of the meaning of words, and not a matter of evidence. If, on the other hand, these words have a special meaning as applied to the petroleum industry, their meaning is properly the subject of evidence. As the District Court declined to take the view that it was a matter of judicial knowledge, the defendant offered evidence by its experts on the meaning of those words as applied to the petroleum industry. The Government failed to qualify any witness as an expert in refining, and consequently the opinions attempted to be expressed by its experts, to the effect that blending is not refining, were not properly admissible. On the other hand, the defendant's experts were qualified on the art of refining, and all of them unhesitatingly said that blending is a very important part of the art of refining; that refining, as applied to the petroleum industry, consists in the separation of the components of crude oil into their various parts, and the production by necessary processes of the finished products thereof. The word "unrefined," in its ordinary sense, denotes a thing that has not been refined, and consequently would undoubtedly embrace this material in that sense. But, in order to meet this meaning of the word, the Government's experts claimed that a process of separation of the

gas from the crude oil had taken place in the earth and that this was a refining process and the only refining process which the material had undergone, and that, in view of its being pure, in the sense of being free of impurities, it needed no further refining. The absurdity of this position is demonstrated by applying this contention to crude oil itself. A crude oil might be absolutely pure, in the sense of being free of impurities, and yet, under their definition of the word "refined," the crude oil would be refined oil. It must be notorious that the principal function of an oil refinery is to convert crude oil into the finished products of it, and the removal of impurities but an incidental process of refining.

It should be observed that the indictment charges that *gasoline* was shipped, and deals with the rates on *gasoline*; but the evidence shows that there also were rates available on unrefined naphtha.

Therefore, if this court judicially knows either (a) that the liquid condensate of casinghead gas is properly embraced within the description "unrefined naphtha," or (b) that it is properly described by both the word "gasoline" and the words "unrefined naphtha," or (c) that it is not the commodity commonly known as gasoline, the case must fall and a verdict should have been ordered for the defendant.

It would seem that as to the last of these propositions, at least, the court must judicially know the fact which is a matter of common knowledge that gasoline as commonly understood is a liquid such as will under ordinary circumstances be suitable for ordinary use in an ordinary motor car or other vaporization use. No pretense was made by the Government to make proof that the material shipped was suitable for other uses than in a motor car, and on this point the evidence overwhelmingly controverts the idea. Leaving aside

all opinions of experts and other witnesses, this fact was proved beyond cavil: that on the tests during the trial conducted jointly by the Government's and defendant's experts it was proven conclusively that under the most favorable circumstances possible the material from the Jenks plant completely failed on both the Packard and Pierce-Arrow cars, and the material from Kiefer completely failed on the Packard car, and there is a conflict of opinion as to how well it worked on the Pierce-Arrow car. Indeed, so adverse did the test develop to the Government's position that it attempted to have stricken from the record all evidence concerning the test after the result was known (Rec., p. 895). Therefore, whether the court knows judicially what the proper name or description of this material is, it is urged that the court at least knows what gasoline is, and the evidence overwhelmingly establishes that this is not the material which the court knows to be gasoline.

**(2) *The opening statement of the Government admitted, and the undisputed evidence showed, that the material shipped was not gasoline, as alleged in the indictment, but liquid condensate of casinghead gas, resulting in a fatal variance between the charge and the proof.***

As previously stated, there has never been any pretense even, on the part of the Government, that the material actually shipped was anything other than the liquid condensate of casinghead gas, commonly called casinghead gasoline. The indictment, however, does not charge the shipment of *casinghead gasoline*, nor aver the rates applicable to casinghead gasoline, but charges the transportation of *gasoline* and avers the rates applicable to it.

The question here considered is not whether unrefined naphtha is or is not a proper name for casinghead

gasoline, but whether casinghead gasoline and gasoline are identical. The very statement of the proposition refutes the possibility of it. "Gasoline" without prefix of any kind is undoubtedly a word in common use, and commonly understood to apply to a commodity commercially dealt in suitable for use such as the operation of motor cars. There is no pretense that casinghead gasoline is this material. The very use of the prefix "casinghead" distinguishes it as something different. It would be utterly immaterial to the question here considered even if the tariffs published a rate (which they did not) on casinghead gasoline which was the same as the rate contemporaneously published on gasoline. It would, nevertheless, be a fatal variance to charge the transportation of gasoline and prove transportation of casinghead gasoline, as a moment's reflection would demonstrate. There are numerous refined products of petroleum which ordinarily take the same rate, as, for example, gasoline, naphtha and kerosene. It is apparent that if it be permissible to charge the defendant with an alleged offense in relation to transportation of gasoline, and prove instead the transportation of casinghead gasoline, it would be entirely possible to charge in another indictment the same transaction as naphtha, and still another the same transaction as kerosene, and simply prove the one transaction concerning casinghead gasoline and attempt to justify the variance on the ground that the rates were the same. It is clear that in such case the defendant might be indicted over and over for one offense under different descriptions and convicted on each indictment by the same evidence.

A variance which would deprive a defendant of the protection of proving a plea in bar by the record is a fatal variance.

The rule as to pleading an indictment, where property is involved in the offense, is that it must be described specifically and by the name usually appropriate to it,

its common acceptation to govern the description with such degree of certainty as will enable the jury to say whether the property is the same as that upon which the indictment is founded.

1 *Wharton's Criminal Procedure* (10th ed.),  
Secs. 254-256.

It is elementary that a description of property in an indictment is material, and that all material averments must be proven as laid.

"It is a positive rule of criminal procedure that the accused shall not be charged with one crime and convicted of another."

6 *Encyclopedia of U. S. Supreme Court Reports*  
(*Michie*), 1909, XVII A.

The rule as stated by Chief Justice MARSHALL in *The Hoppet*, 7 Cranch 389, 394 (11 U. S. 388, 393), is:

"Is it cured by any evidence showing that, in point of fact, the vessel and cargo are liable to forfeiture? The rule that a man shall not be charged with one crime, and convicted of another, may sometimes cover real guilt, but its observance is essential to the preservation of innocence. It is only a modification of this rule, that the accusation on which the prosecution is founded, should state the crime which is to be proved, and state such a crime as will justify the judgment to be pronounced. The reasons for this rule are, 1st, That the party accused may know against what charge to direct his defense. 2nd, That the court may see with judicial eyes that the fact, alleged to have been committed, is an offense against the laws, and may also discern the punishment annexed by law to the specific offense. These reasons apply to prosecutions in courts of admiralty with as much force as to prosecutions in other courts. It is, therefore, a maxim of the civil law, that a

decree must be *secundum allegata* as well as *secundum probata*. It would seem to be a maxim essential to the due administration of justice in all courts."

Instances of variance held fatal in the federal courts are:

In *United States v. Denicke*, 35 Fed. Rep. 407, where the indictment described a letter as being addressed to the treasurer of the Travelers Insurance Company, when the proof showed that it was directed to the Traders Insurance Company.

In *United States v. Rhodés*, 212 Fed. Rep. 513, an indictment for concealing assets in bankruptcy alleged goods, wares and merchandise, number, kind and quality to the grand jurors unknown, and the evidence showed that the character, kind and description of goods at least to a large extent were known to the grand jury.

In *Feener v. United States*, 249 Fed. Rep. 425 (Circuit Court of Appeals for the First Circuit), a similar indictment, where it was held that it was incumbent on the prosecution to show the fact, or a fatal variance would result.

In *Thompson v. United States*, 256 Fed. Rep. 616 (Circuit Court of Appeals for the Second Circuit), it was held that where an indictment alleged larceny of property belonging to the United States it was necessary to prove that the property did so belong to the United States, or a fatal variance would result.

In *United States v. Phelan*, 250 Fed. Rep. 927, the defendant had pleaded to an indictment a former acquittal, which arose by reason of a variance growing out of misdescription of a written instrument. It was of course held that an acquittal by reason of a variance is not a bar to further prosecution for the substantive crime attempted to be, but not accurately, described in the first indictment; the court saying:

“The offense described in the present indictment is not the same as that described in the former one, a copy of which is annexed to the defendant’s plea.” (p. 927.)

It is perfectly obvious in the instant case that if the defendant was again indicted for these same transactions on a charge of receiving concessions on shipments of naphtha, and offered a plea of former jeopardy, the court would have to say, just as it did in the case last above cited, that the offense described in the new indictment is not the same as that described in the former one. The mere similarity of dates of shipment, places, etc., would not be sufficient; for like similar data must necessarily have appeared in the *Phelan* case, the only difference being in the description of the instrument.

**(3) *The Government’s opening statement and the proof show a controversy as to the proper construction of tariffs, thus ousting the court of jurisdiction, because jurisdiction to construe tariffs is exclusively confided to the Interstate Commerce Commission under the Act to Regulate Commerce and decisions of this Court thereon.***

Had the indictment in this case truly pleaded the facts, it would have averred in substance that the material shipped to defendant was liquid condensate of casinghead gas, commonly known as casinghead gasoline (unblended, or blended with naphtha in the proportions of two parts of the casinghead product to one part of the naphtha), that there were no rates published specifically naming this material by those names, but that there were rates published on gasoline; that said rates on gasoline were the proper rates to be applied to the commodity; that the amount of such rates was so much; that there were other lower rates published on unrefined naphtha, but not properly applicable to the commodity;

that nevertheless the commodity was shipped to defendant under the description and upon the rate applicable to unrefined naphtha, and that thereby the defendant procured a concession with respect to the transportation of the commodity. But the Government was very careful, and designedly so, not to plead in the indictment the facts, for the manifest reason that it would be demurrable on its face, under the decision of this Court in the *American Tie & Timber case*, 234 U. S. 138. In that case, the question involved is on all-fours with the question involved here. There had been a rate on cross-ties, which had been cancelled, as a result of which it was contended that, cross-ties being in the nature of lumber, the lumber rates were applicable; and this question was submitted for decision by the courts. The Court, however, pointed out that jurisdiction to construe tariffs was confided exclusively in the Interstate Commerce Commission by the Act to Regulate Commerce, and pointed out the reason why it was essential that such should be the rule, in order to bring about that uniformity of treatment of shippers that it was the fundamental purpose of the Interstate Commerce Act to accomplish, *i. e.*, that if such matters were left to the determination of juries and courts, one jury might find one way, another jury the opposite, a court in one jurisdiction might hold one way and a court in another jurisdiction the opposite, as a consequence of which one shipper would receive one treatment under his decision, and the other a different treatment.

The fact that this prosecution was instigated by the prosecuting arm of the Interstate Commerce Commission should not for a moment be mistaken as implying that it was the construction of the Commission in its judicial capacity that the tariff on gasoline covers this commodity. On the contrary, it simply betokens the unwillingness of the prosecuting branch of the Commission to trust the Commission to decide the matter; but

instead they procure an indictment not disclosing the real controversy, but deliberately designed to conceal it.

This Court has repeatedly upheld the doctrine of the *American Tie & Timber* case since its enunciation, and no case could be imagined wherein the reasoning of that case would make it more applicable than to the instant case.

There are other indictments pending upon this question in the same jurisdiction, and there are civil suits pending in relation to the matter in other jurisdictions. Some of these civil suits are pending in the State of Texas, the laws of which make it a criminal offense to call the material here involved, for the purposes of sale or transportation, by the description gasoline, or gasoline in combination with any other word or words, which would of course embrace casinghead gasoline. It is inconceivable that upon the trial of this same question in those suits in Texas the same result would be reached as was reached upon this indictment. If a question of this kind is open to more than one jurisdiction, the anomaly might readily result that the legal rate applicable to the commodity, under the decisions of the United States District Court for Texas, is unrefined naphtha, while under the decision of the United States District Court for Oklahoma it would be gasoline.

Following is the syllabus of the *American Tie & Timber* case (234 U. S. 138):

"Whether a class tariff includes a particular commodity is a controversy primarily to be determined by the Interstate Commerce Commission in the exercise of its power concerning tariffs and the authority to regulate conferred upon it by the Act to Regulate Commerce.

"The courts may not, as an original question, exert authority over subjects which primarily come within the jurisdiction of the Interstate Commerce Commission.

"Whether cross-ties are or are not lumber and therefore within the tariffs filed for the latter is a question on which there is great diversity of opinion even among the experts upon the subject, and one that should be determined in the first instance by the Interstate Commerce Commission."

In this case, the very question involved is, (a) does the gasoline tariff "include the particular commodity" liquid condensate of casinghead gas, or (b) whether the liquid condensate of casinghead gas "is or is not" gasoline, "and therefore within the tariffs filed, for the latter is a question on which there is great diversity of opinion even among experts on the subject." Six experts of unassailable standing testified positively for the defendant that it is not. Two experts—and it is worthy of note in this connection that the Government did not call the eminent scientists connected with the Bureau of Mines, but hired outside experts—testified that it was. A situation could not come more squarely within the rule laid down by this Court than this does. It would not do to try to answer this proposition by sweeping aside all the testimony of the defendant's experts and say that the question is too plain for argument. That very contention was made in the *American Tie & Timber case*. It was there argued that the rule of primary jurisdiction in one body was well enough abstractly, but that it ought not to prevail when the reason for it no longer existed, and therefore, ought to have no application there,

"because it is so plain that oak cross-ties were included in the lumber rate as fixed in the tariff of the Railway Company that there is no reason for proceeding primarily before the Commission, as there is no possibility of difference on the subject if left to the consideration of the courts. We need not pause to point out the palpable error of law which the proposition involves since on the

face of the record it is apparent that the assumption of fact upon which it rests is absolutely without foundation. We say this because nothing could more clearly demonstrate such result than does the conflict and confusion in the testimony concerning whether cross-ties were included in the filed lumber tariff." (234 U. S. 147.)

And the court goes on to point out a further demonstration arising from the fact that in the trial of the very same case at the first hearing the trial judge was so clearly of opinion that cross-ties were not lumber that he so charged the jury and directed a verdict.

In this case the trial court even conceded that he considered the question not free from doubt, and intimated that if it was a personal indictment he would not be disposed to submit the question to the jury, but that since it was a corporation the question had better be determined higher up (*Rec.*, pp. 899-900). There is of course scant justice in this view, but, to use the expression of this Court in the case above cited, it is "a demonstration" of the fact that there is ambiguity, to put it mildly.

At the conclusion of the evidence the defendant moved a directed verdict, and the following from *pages 899 and 900* of the Record shows the court's impression on the subject:

"By Mr. Diggs: We will also ask that this case be dismissed by the court for the want of jurisdiction arising from the question that it involves a construction of the tariffs as to whether this commodity included within the meaning of gasoline.

"By the Court: Very well. I do not think that question is free from doubt but when (then) I am going to resolve that in favor of the government so that if the jury brings in an adverse verdict you can get a test but I am not sure about that. Those questions were raised in the demurrer and

wherever there is ambiguity and the question is ambiguity, that itself is not enough to preclude it from being a criminal case. I am not sure about that.

"By Mr. Diggs: I just mentioned that at this time so your honor may consider it in connection.

"By the Court: Very well, I do not think the court ought to do that when a man's liberty is stake. I would not do that if it involved a question of imprisonment. I would give my best judgment but these questions have got to be determined.

"The Court: Is there any special thing you want to bring to the attention of the court? I see you have brought some authorities over here.

"Mr. Diggs: I brought some authorities on the assumption the court wanted us to state our position on the question of jurisdiction.

"The Court: That is the same proposition as argued by demurrer?

"Mr. Swacker: No, sir, because the indictments are not so pleaded that we could raise it on demurrer; the railroads did but we could not.

"The Court: Yes.

"Mr. Swacker: And in the way it was pleaded, we could not argue this—

"The Court: You did—they did do it and I did not examine the pleadings, to see whether they should be, but I reached the conclusion the question ought to be definitely passed on by the Supreme Court of the United States, and I overruled the demurrer.

"Mr. Swacker: The way it is pleaded is that we shipped gasoline and the proof is we shipped casinghead gasoline which it is argued takes the gasoline rate. We think the case ought to be dismissed on the ground of variance, because of the variance between the pleadings and the proof, and the only way this jurisdictional question can be saved is by showing by the proof, because we cannot rely on the pleadings to prove it.

"The Court: What does the variance consist in?

"Mr. Swacker: The indictment charges we shipped gasoline. The proof is undisputed we shipped casinghead gasoline from which the government argues and contends that casinghead gasoline takes the gasoline rate, and if it had been pleaded that way it would have been demurrable on its face, under the *Tie & Timber case*, but not having been pleaded that way, the only way this question can be saved is by calling it to your honor's attention now, and asking an instruction on the variance of the testimony. Now, your honor is confronted with the necessity of trying to construe that tariff.

"The Court: Yes—I will not take it away from the jury on that ground. I will give you an exception to that."

Finally the Interstate Commerce Commission's safe transportation rules afford the best demonstration conceivable of ambiguity in the name of the material. It should be noted that these rules are in no sense rules affecting or determining the description to be used for rate or classification purposes, but are rules merely relating to a description required to be used as a matter of safety.

X The rules that were in force during the early part of the period herein involved provided that when the liquid condensate from natural gas or from casinghead gas of petroleum oil wells had a vapor tension exceeding 10 pounds it must be described as liquefied petroleum gas, and shipped in specially constructed tank cars; and that when the condensate, unblended or blended with other products, has a vapor tension not exceeding 10 pounds, and "is shipped as gasoline," it may be shipped in ordinary tank cars; and these rules further provided that the condensate when blended with refinery gasoline or naphtha "may be described and shipped as gasoline" X when the vapor tension does not exceed 10 pounds (*Rec.*, pp. 430-433, 1089, 1090). And during the balance of the

time these rules, while remaining the same as to material over 10 pounds, provided that when under 10 pounds "it must be described and shipped as gasoline, casinghead gasoline or casinghead naphtha" (*Rec.*, p. 1159). After this rule went into force it should be borne in mind that all shipments to defendant, in addition to bearing the description "unrefined naphtha," bore the description "casinghead naphtha," in compliance with this rule, which fact was conceded by the Government.

It should be further noted that in these rules the expression "may be" is used as applied to gasoline, and other similar rules use the expression "must." Furthermore, the word "gasoline" in the "may be" rule is placed in quotation marks by the Commission itself, and the only other instance the safe transportation inspector League was able to find of the use of quotation marks around a name was "strike anywhere" matches. This seems to show rather clearly that the Commission recognized that gasoline was not the true name of the material (*Rec.*, pp. 432-434).

#### PART IV (b).

**The evidence received on the theory of admissions by defendant and the Gypsy Oil Company, consisting in a practice of calling liquid condensate of casinghead gas by the appellation "gasoline" at other times and under other circumstances was improperly admitted, and prejudicial.**

Assignments of Error VII (*Rec.*, p. 1544), Government Exhibit 1 (*Bill of Exceptions*, *Rec.*, pp. 951, 952), showing the fact that the capital stock of both the Gypsy Oil Company and the defendant was owned and controlled by the Gulf Oil Corporation, admitted on the theory of making statements of the Gypsy Oil Company and its employees admissions by the defendant: VIII (*Rec.*, p.

1544), the testimony (*B. of E., Rec., pp. 183-196*), and XIII (*Rec., p. 1552*), Government Exhibit 2 (*B. of E., Rec., p. 953*), and the testimony in relation thereto (*B. of E., Rec., pp. 253, 254*) of J. H. Riedeman, a former employee of the Gypsy Oil Company: XII (*Rec., pp. 1550, 1551*), the testimony of the witness Manson, another former employee of the Gypsy Oil Company (*B. of E., Rec., pp. 251-253*), and Government Exhibits 5, 6, 7, 8 and 9 (*B. of E., Rec., pp. 958-966*), showing in substance that previous to the date, *i. e.*, December 2, 1916, when the unrefined naphtha rates became effective, shipments to defendant were described by the Gypsy Oil Company as "gasoline": IX, X and XI (*Rec., pp. 1546-1550*), the testimony of the witness Sweet, superintendent of the Gypsy Oil Company (*B. of E., Rec., pp. 200-230*) in substance to the effect that previous to the date, *i. e.*, December 2, 1916, northbound rates were made effective on crude unfinished naphtha, the blending material shipped north was described as "naphtha," and thereafter as "crude unfinished naphtha"; his testimony in substance that previous to December 2, 1916, the material shipped to Port Arthur was commonly known as "gasoline" and thereafter as "unrefined naphtha"; and his testimony that the same commodity as was shipped to Port Arthur described as "unrefined naphtha" after December 2, 1916, was also shipped to Pittsburgh, Pa., under the description "gasoline," that description being used because there was no similar unrefined naphtha rate published to Pittsburgh and "gasoline" was therefore the only term of description they could have used upon such shipments: XXXI (*Rec., p. 1591*), the evidence (admitted by defendant, subject to objection) while the witness Sanderson, general superintendent of the gasoline department of the Gypsy Oil Company, was on the stand (*B. of E., Rec., pp. 476-483*), in substance as follows: That previous to December 2, 1916, the material shipped to Port Arthur was described as "gasoline"; that at the incep-

tion of the business the casinghead material was blended with naphtha and shipped to northern points to market and described as "gasoline"; that in the early part of 1915 such shipments were discontinued, and thereafter shipments were made until December 2, 1916, to Port Arthur under the description "gasoline," and after December 2, 1916, under the description "unrefined naphtha," and that before and after December 2, 1916, shipments were made to Pittsburgh described as "gasoline," the degree of blend of the material shipped to northern points to market in 1913 and 1914 not however being shown: XXXII (*Rec.*, pp. 1595, 1596), the evidence (admitted by defendant, subject to objection) of the witness Hoagland (*B. of E., Rec.*, pp. 487, 488) that the material shipped to Pittsburgh was identical with that shipped to Port Arthur taken from the same tank at the same time: XLIV and XLV (*Rec.*, pp. 1600, 1601), the testimony of the witness Millard (*B. of E., Rec.*, pp. 547-558), a former employee of the Gypsy Oil Company, to the effect that the material shipped previous to December 2, 1916, was billed as "gasoline" and thereafter as "unrefined naphtha," and that the shipments in the earlier years direct to market were also billed as "gasoline," but that this product was different from that shipped to Port Arthur in that it was further blended, more naphtha being used in order to bring it to the gravity specifications ordered: XLIII (*Rec.*, p. 1600), Government Exhibit 95 (*B. of E., Rec.*, pp. 1375, 1376), and the testimony of the witness Lyon (*B. of E., Rec.*, pp. 542-547) showing that the shipments forwarded in 1913 and 1914 direct to market were invoiced and described as "blended gasoline": XIV (*Rec.*, p. 1553), the testimony of the witness Weddell (*B. of E., Rec.*, pp. 276-283), agent of the delivery carrier, to the effect that he collected charges from defendant previous to December 2, 1916, on shipments billed as "gasoline" at the gasoline rates: XV (*Rec.*, pp. 1553-1557), testimony of the witness Timmons (*B. of E., Rec.*, pp.

290-323) concerning entries reading "gasoline" made in a book not offered in evidence nor made by the witness, but made by laboratory test boys, whose functions did not include classifying or naming material, but merely consisted in recording the data of physical characteristics developed by tests, and who were not shown to have any duties in anywise relating to shipping: XLII (*Rec.*, p. 1600), testimony of same witness (*B. of E.*, pp. 290-323, 541, 542) and Government Exhibit 94 (*B. of E.*, *Rec.*, p. 1369), XLVIII (*Rec.*, p. 1601), Government Exhibits 110 to 119, inclusive (*B. of E.*, *Rec.*, pp. 1444-1453), LII and LIII (*Rec.*, p. 1602), Government Exhibits 120 to 134, inclusive, and 10 to 14, inclusive, said exhibits being records showing the numbers of the tanks at refinery into which shipments were unloaded, pumping records showing movement of materials between tanks and distillation test records by which it was sought to be established the material was gasoline, or was so called because other distillation tests of the same numbered tanks were entered "gasoline," whereas the testimony showed the fact to be that the tanks in question were used for making gasoline and that the practice was to unload the material shipped into said tanks and there blend it with other material to make gasoline: XXXIII and XXXIV (*Rec.*, pp. 1596-1598), being the testimony of the witness Koontz (*B. of E.*, *Rec.*, pp. 489-496), a laboratory tester, in substance that he made entries on distillation test sheets in which he characterized the contents of certain tanks as gasoline, whereas it was shown that it was no part of his duty to classify the material but merely to record the indicia of the physical tests; also that instructions were issued about the time the practice of using the description "unrefined naphtha" in shipping arose, to refinery employees to use that description thereafter instead of the description "Kiefer gasoline" theretofore used by them: XXXVIII, XXXIX, XL, XLI (*Rec.*, pp. 1599, 1600). Government Exhibits 85 to 93, inclusive (*B. of E.*, *Rec.*,

pp. 1363-1368), being communications between defendant's traffic manager Ellis and officials of the carriers, as follows: January 15, 1914, Ellis to Mr. Powers of Frisco railroad, requesting reduction of gasoline rate from Kiefer to Port Arthur; letter May 29, 1916, from Frisco railroad to Ellis, inquiring if any objection by defendant to cancellation of gasoline rates Oklahoma to Port Arthur; June 5, 1916, reply of Ellis stating does not wish rate cancelled, as it is in daily use; February 9, 1915, Ellis to Frisco railroad and Southern Pacific, requesting further reduction of gasoline and naphtha rates between Kiefer and Port Arthur; March 18, 1915, reply to above declining to make further reduction; January 18, 1914, telegram Ellis to Kansas City Southern railway requesting establishment rate on gasoline for coastwise shipment; January 19, 1914, telegram Ellis to Kansas City Southern railway requesting establishment northbound rate on naphtha; January 19, 1914, letter Ellis to Frisco railroad and Kansas City Southern railway confirming request and explaining that naphtha was being moved northbound to be further refined with products then at Kiefer, and that the outbound shipments from Kiefer would consist of gasoline, of which there would be two cars out for each one of naphtha in; January 19, 1915, letter from Southern Pacific railroad and Frisco railroad to Ellis replying to latter's request for establishment of a 15c rate as a transit proposition, declining to do so on the ground that the material having passed beyond a crude state it would result in disturbing the rate basis applicable to refined oils: XLIX (*Rec.*, p. 1601) and LI (*Rec.*, p. 1602), being Government Exhibits 68 and 69 (*B. of E., Rec.*, p. 1290) and 135 to 138, inclusive (*B. of E., Rec.*, pp. 1458-1461), being communications from defendant's traffic manager, Ellis, to W. P. Donovan, superintendent of Gypsy Oil Company, instructing latter over what routes to forward shipments to Port Arthur, and advising him concerning certain safety regulations; this

evidence having been admitted on the theory that it indicated exercise of control over Gypsy Oil Company by defendant: and LXXXI (*Rec.*, pp. 1640-1645), denial of motion to strike out all of the foregoing testimony and evidence (*B. of E.*, *Rec.*, pp. 625-630, 897).

The theory upon which all this evidence was admitted was that the practice of calling and shipping the material as gasoline (previous to the publication of the rates on unrefined naphtha) by agents and employees of the company, constituted an admission that the material was in fact gasoline. As it so happened, however, that the great bulk of this evidence consisted in declarations by representatives of the Gypsy Oil Company, it was thought to impute their acts to the defendant by showing that the Gypsy Oil Company was controlled by the same corporation that controlled the defendant. It is rather a novelty to constitute a criminal agency solely by reason of intercorporate relationship, and the trial court was rather loath to embrace this doctrine, and admitted the earlier evidence rather on the theory of showing the general course of conduct of the Gypsy Oil Company (the relevancy of which is not apparent). But the Government finally rested its claim to impute to the defendant the acts of the Gypsy Oil Company on the letters (*Exhibits 68, 69, 135-138*) from the traffic manager of the defendant to the superintendent of the Gypsy Oil Company directing the latter over what route to forward shipments and calling his attention to certain safety regulations; contending that they established the exercise of control by the defendant over the Gypsy Oil Company.

There is, of course, absolutely no warrant for any such assumption as any purchaser of material might and would very properly write the seller giving him directions as to the route of shipment desired and calling his attention to regulations involved. This, however, is not the important point. The real point is that the admission of this evidence, as admissions, violates the most

elementary factors of the *res inter alios acta* rule. Some of the evidence in question, such as that of the witness Millard (*Rec.*, pp. 547, 548), shows that it embraces a different material than that shipped to Port Arthur, namely, the blended gasoline, which was and ought in fact to have been shipped as gasoline. The distillation tests, pump records and unloading records by which the Government sought to make it appear that because tests on certain days of certain numbered tanks bore the description "gasoline," and the unloading records of that day showed certain cars of the casinghead material had been pumped into those tanks, that the casinghead material had been denominated gasoline, whereas the testimony showed that the fact was that the tanks were used to make gasoline and that the casinghead material was put into those tanks in the course of such manufacture, so that the test reading "gasoline" was the finished product resulting from the blending.

Declarations or acts concerning other transactions than those involved, even though by the same party, in order to be receivable as admissions, or indeed to have any evidentiary value, must be declarations or acts done under similar circumstances in all material respects.

Such facts being of course purely collateral, are ordinarily inadmissible because entirely irrelevant. When, however, they tend to show a course of conduct or habit, they may become relevant. In such case, however, it must be a course of conduct or habit in similar situations. Obviously, the shipment of blended gasoline (as that expression has been used in this case) as gasoline affords not the slightest inference of the existence of a habit of shipping something else as gasoline. Again, the shipment of a certain material as gasoline under a classification permitting such description or offering no other choice, has not the slightest probative force to establish that the identical material shipped under an-

other classification permitting of a choice or authorizing the use of a more appropriate designation, is gasoline. It should be understood that the defendant has at no time disputed, but on the contrary freely admitted (subject to exception) throughout the trial, that it had been its practice to ship the identical material and describe it as gasoline *under different circumstances*.

Before the establishment of the unrefined naphtha rates to Port Arthur, and at all times as to Pittsburgh, there were no unrefined naphtha rates or classifications. If, however, the classifications that did exist would permit of the shipment of this particular material under the description of gasoline, *even though it was not in fact the material commonly known as gasoline*, then it is perfectly obvious that the fact of so shipping it could not have the slightest probative force to establish that the material was in fact gasoline. The attitude of the trial court upon the objection to the admission of this class of evidence was that if such was the situation it would be a matter for the defendant to explain, and explanation to the above effect by the defendant would tend to affect the probative value of the evidence offered by the Government. It will readily appear where this rule would lead to, quite apart from shifting the burden of proof to the defendant. It would result in going into the trial of a collateral subject, namely, what during other times than those involved in the indictment, as to Port Arthur, and what as to other places not involved in the indictment, as to Pittsburgh, did the classifications permit with respect to the shipment of this material as gasoline? Upon the trial of such issue, and with the burden improperly upon the defendant, it would be found, for example, that although this material was not the material commonly known as gasoline, yet, by reason of the peculiarity of the classifications naming rates on gasoline it could properly be shipped under that description. The situation would then be that it would be established that

the evidence originally offered of such previous shipment under such other circumstances had no probative force whatever, and it would be necessary that it be stricken out. The mere statement of such procedure shows the impropriety of the practice of admitting the evidence at all in the first instance without the contemporaneous establishment of the fact by the Government that the circumstances were identical (in material respects).

To correctly appraise this evidence it is useful again to consider its character. To be supposed to be relevant at all, it must be assumed to tend to prove that the material shipped to Port Arthur under the description "unrefined naphtha" was in fact gasoline. Obviously, it is not supposed to be direct proof. The idea is that because at other times similar material was described for shipment as gasoline, the inference is that it was gasoline. This on the fact of it is of course a violent disregard of the hearsay rule, because purely extrajudicial, not subject to cross examination, etc. But this defect of it might be curable by an exception to the hearsay rule, if the evidence was of a character relevant to establish an admission, the theory being that if the defendant so characterized the material as gasoline, inferentially it was gasoline, and piling inference on inference that therefore the material shipped to Port Arthur was inferentially gasoline. But the fatal trouble with it is that it starts off with the presumption that the evidence offered is *relevant* towards proving that there was any admission that the material was gasoline.

Professor Wigmore, examining evidence of this character, says:

"Sec. 32. *Same: With Reference to the Proponent of Evidence.*—\* \* \* Thus, throughout the whole realm of evidence, circumstantial and testimonial, the theory of the inductive argument, as practically applied from the standpoint of ad-

missibility, is that the evidentiary fact will be considered when, and only when, the desired conclusion based upon it is a more probable or natural, or at least a probable or natural, hypothesis, and when the other hypotheses or explanations of the fact, if any, are either less probable or natural, or at least not exceedingly more probable or natural. The degree of strength required will vary with different sorts of evidentiary facts, depending somewhat upon differing views of human experience with those facts, somewhat upon the practical availability of stronger facts, and somewhat upon the hardships of certain inferences in case they should be unfounded. But the general spirit and mode of reasoning of the courts substantially illustrates the dictates of scientific logic.

"Sec. 33. *Same: Occasional Subordinate Tests; Method of Agreement and Method of Difference.*—The main question for the inductive argument being (in the words of Professor Sidgwick, already quoted), 'What certainty can we obtain that the alternative chosen is the right one out of all those conceivable?' there have been stated by scientific logic several subordinate methods or processes of investigation which may be viewed as attempts to answer this question. Usually enumerated as five, they are reducible in essence to two—the Method of Agreement and the Method of Difference. Occasionally they may be and are conveniently resorted to in the testing of judicial evidence.

"(a) *Method of Agreement.*—The canon to which this applies may be thus stated: 'Whatever circumstances can be excluded without excluding the phenomenon whose effect (or cause) is being sought; or can be absent notwithstanding its presence, are not causally connected with it. \* \* \* The remainder, those circumstances which are not eliminated by this process, are supposed to be thus shown to be essential to the phenomenon—to be the proved effect (or cause).' From the point of view of proof, then, when we argue that

the observed instances of *a*, viz., *a'*, *a''*, *a'''*, being always followed by *b*, proves *a* to be the cause of *b*, we can avoid the danger of ignoring other causes as the true explanation, by providing that the various instances shall be attended by identically the same circumstances or conditions; then, and then only, when *a*, under identically the same conditions, is followed always by *b*, have we the right to claim that *b* is the effect of *a* and not of some other cause. Applying this method from the standpoint of mere admissibility, we of course do not need to exclude so rigorously the possibility of other explanations; accordingly our test would be whether the evidential instances occurred under substantially similar (not identically the same) conditions, i. e., so that the supposed conclusion is at least the more probable, though not the only possible, explanation. This subordinate test— which is merely a practical aid to the ultimate or fundamental one—will naturally be most available and useful where the evidential fact consists of a supposed parallel instance. To illustrate: (1) In showing that a person's illness was due to the eating of certain food, the fact is offered that other persons were ill after eating of the same food. Here the test naturally to be applied is whether the other illnesses occurred under substantially similar conditions of time, surroundings, and symptoms. (2) To show that a portion of a pavement caused an injury because dangerous to passers-by, the fact is offered that other persons who passed fell down at that place. Here a similar test is called for. Judicial annals contain a vast variety of instances in which this same subordinate test is the natural one to be applied, and is in practice used by the courts.

“(b) *Method of Difference*.—The canon of this method is: ‘If an instance in which the phenomenon under investigation occurs, and an instance in which it does not occur have every circumstance in common save one, that one only occurring in the former; the circumstance in which alone the two

instances differ is the effect, or the cause, or an indispensable part of the cause, of the phenomenon.' As applied to the judicial purposes of admissibility, the test of this argument becomes: In order to prove that  $x$  is the cause of  $b$ , by the fact that whenever  $x$  was present the effect  $b$ ,  $b'$ ,  $b''$ , was found, and that wherever  $x$  was not present the different effects  $c$  or  $d$  were found, the various instances  $b$ ,  $b'$ ,  $b''$ ,  $c$  and  $d$  are admissible if they were substantially similar to each other in all respects except the presence of  $x$ .

"This test is of comparatively rare employment in judicial evidence, because it is rare that instances occur which fulfill this requirement, unless where pre-arranged experiments are possible. But so far as the conditions of the case admit the fulfillment of the requirement, the argument may be and is employed. To illustrate: The injury to the paint on the plaintiff's house is attributed by the defendant to sewer-gas; for this purpose, he is allowed to use the fact that 'under conditions and circumstances as nearly as possible like those surrounding the plaintiff's house,' except the presence of the sewer-gas, the injury to paint did not occur.

"The purpose in using both these subordinate tests is always the same general one—to secure a fair probability for the claimed hypothesis, as against and in competition with other possible ones. It is enough to note here that these specific and accepted logical tests are occasionally available and are judicially applied in the admission of litigious evidence."

*1 Wigmore on Evidence (2nd ed.), Secs. 32, 33.*

"Sec. 442. *Principle of Probative Value (Relevancy)*—The requirements for this process of inference are indicated by the logical principles already examined at the outset (*ante*, Secs. 30-36), and a brief re-statement will be sufficient. There is presented, as the *factum probandum*, a capacity or tendency in  $X$  to produce the specific effect  $B$ . This means that in the presence of a certain complex of circumstances the introduction of  $X$  will result in the occurrence of  $B$ ; *i. e.*, this alleged

tendency or capacity in X is not an abstract and absolute one, but a limited and specific one, namely, a capacity, under the circumstances in which B occurred, to be followed by B. What X's capacity or tendency under other circumstances might be, is immaterial; the single question is whether there was such a capacity or tendency under the circumstances in hand. In looking elsewhere, therefore, to evidence this specific capacity or tendency by observing the same effect elsewhere, the requirement is that the circumstances elsewhere are the same as in the case in hand. Thus, if elsewhere are found similar results, B' and B'', accompanying X, it cannot be inferred that they are the result of the alleged tendency of X, unless the other circumstances in those cases were similar to that in issue; because otherwise it cannot be known that some other circumstance, Y or Z, was not the cause of B' or B''. In other words, unless the circumstances are the same, the door is open for other hypotheses that might account for the effects B' and B'', as well as for B. Thus, if the proposition is that X factory's vibrations have a tendency to injure an adjacent building B, the falling of timbers in other adjacent houses B' and B'' might not evidence such a tendency if B' were an old house and B'' were a wooden house, while B was a new brick house; the case B' would at most indicate a tendency in X to injure an old house, not a new house B; and the case B'' would at most indicate a tendency in X to injure a wooden house, not a brick house B. Or, again, if in a third house B''', lying on the other side of X factory and next to Y factory also, there is a similar injury, it cannot be inferred that it is the result of a tendency in X to produce such an injury to B, because the factory Y may have caused, partly or solely, the injury to B'''. The general logical requirement is, then, that when a thing's capacity or tendency to produce an effect of a given sort is to be evidenced by instances of the same effect found attending the same thing elsewhere, these other instances have probative value—*i. e.*, are relevant—to show such

a tendency or capacity *only if the conditions or circumstances in the other instances are similar to those in the case in hand.*

"But this similarity need not be precise in every detail. It need include only those circumstances or conditions which might conceivably have some influence in affecting the result in question. For instance, in the case put above, the circumstance that house B' was of wood while house B was of brick would conceivably affect the ease and likelihood of injury by vibration; but the circumstance that the inner walls in B' were papered while those in B were kalsomined, or that the house B' was painted red while the house B was painted green, or that the occupant of house B' was a Presbyterian while the house B was occupied by a Methodist—such a circumstance, though perhaps material in other aspects, could not have any bearing upon the likelihood of injury by vibration. A similarity between the two cases in respect to such circumstances, therefore, would not be required. The similarity that is required is, in short, a similarity in essential circumstances, or, as it is usually expressed, a *substantial similarity*, i. e., a similarity in *such circumstances or conditions as might supposably affect the result in question.*

"The logical foundation of this principle has been already set forth in another place (Secs. 30-33). As applied to the present sort of inference it has constantly received the sanction of the courts; and whatever are the inconsistencies of its applications, there is substantial unanimity in the general reasoning:" (Italics his).

*Leonard v. Southern Pacific Co.*, 21 Oregon. 555,  
 559.

In *Cohn v. Saidel*, 71 N. H. 558, 53 Atl. 800, the court was concerned with a situation in many respects similar to the evidence here involved. The case was one for malicious prosecution, and the plaintiff sought to show that the defendant had previously instituted another action, which he had after the lapse of time permitted to be nonsuited. The plaintiff's theory was that permitting himself to be nonsuited amounted to an admission by the defendant that he never had a legitimate cause of action. As the court, upon careful consideration of the whole subject of inferences, pointed out, a reasonable inference might be drawn that such was the case and another inference just as reasonable drawn to the contrary, and that consequently the evidence could have no probative force whatever, but would merely lead to collateral inquiries.

In *United State Fidelity & Guaranty Co. v. Des Moines National Bank*, 145 Fed. Rep. 273, the court was confronted with substantially the same question, and said:

"Thus the charge proceeded, upon the view that, while the matter of when and how the loss occurred and what became of the money was not shown but left to conjecture, Kelley's relation to the money, his control over it, and his custody of it, were such that the jury would be justified in inferring that the loss, because not shown to be otherwise, was in some way or other the result of culpable negligence on his part. Essentially the same idea is expressed by counsel for the bank, when they say:

'We contend that by the manner of procedure in this bank, and the system of accounting in

vogue in this bank, we have shown conclusively that Kelley got the money and can't tell what became of it, and so his bond is liable unless they show what became of it.'

"We cannot concur in that view. It presupposes that the reserve cash was within the control and custody of Kelley, and applies to him the rule applicable to a bailee or other custodian whose situation is such that a loss, if not otherwise explained, warrants the inference that it was due to his negligence or dishonesty. Kelley occupied no such relation to this money. He could take from it to replenish the counter cash and add to it from the latter, and it was his duty to count it at the close of business each day, and then to lock the safe; but, in other respects, it was not within his control or custody. It was the cashier, and not Kelley, who carried the combination to the lock, who could say whether the reserve chest should be kept locked or unlocked during business hours, and who could otherwise take measures for the safety of the money. When Kelley was attending to his important duties in the paying teller's cage, as was required most of the time, the reserve chest and its contents were beyond the range of his observation, the chest was unlocked, and its contents were easily accessible to other employes, over whom he had no control, and who were passing in and out of the vault, and sometimes out of the bank, without any immediate supervision of their movements. True they had no right to disturb the money, but that was not an assurance that none of them would yield to the temptation which the situation presented; nor does the presumption of innocence, which would protect them from the charge of theft in the absence of satisfactory evidence thereof, warrant the inference that Kelley was either negligent or dishonest. *Smith v. First National Bank*, 99 Mass. 605, 97 Am. Dec. 59. Such an inference cannot be legitimately drawn from a rebuttable presumption, but only from premises which are certain.

*United States v. Ross*, 92 U. S. 281, 23 L. ed. 707; *Manning v. Insurance Co.*, 100 U. S. 693, 25 L. ed. 761; *Looney v. Metropolitan R. R. Co.*, (U. S.) 26 Sup. Ct. 303, 50 L. ed. . . . ; *Globe Accident Ins. Co. v. Gerisch*, 163 Ill. 625, 45 N. E. 563, 54 Am. St. Rep. 486; *Chicago etc. Ry. Co. v. Rhoades*, 64 Kan. 553, 68 Pac. 58.

"Passing, for the moment, the fact that Kelley neglected to make a daily count of the money in the reserve chest, it is plain that the evidence bearing upon the cause or occasion of the loss was altogether circumstantial, and was as consistent with the theory that the loss was occasioned solely by the personal dishonesty of one of the other employes, to whom the money in its exposed condition was easily accessible, as with the theory that it was occasioned by the personal dishonesty or culpable negligence of Kelley. Which theory was correct was left to mere conjecture. The bank had the burden of proof, and, as it failed to produce any evidence reasonably tending to establish the latter theory to the exclusion of the other, the guaranty company was entitled to a directed verdict in its favor. *Asbach v. Chicago etc. Ry. Co.*, 74 Iowa 248, 37 N. W. 182; *Smith v. First National Bank*, 99 Mass. 605, 97 Am. Dec. 59; *Crafts v. Boston*, 109 Mass. 519; *Morley v. Eastern Express Co.*, 116 Mass. 97; *Searles v. Manhattan Ry. Co.*, 101 N. Y. 661, 5 N. E. 66; *Ruppert v. Brooklyn Heights R. R. Co.*, 154 N. Y. 90, 47 N. E. 971; *Chicago etc. Ry. Co. v. Rhoades*, 64 Kan. 553, 68 Pac. 58. As was well said by the Supreme Court of Iowa in *Asbach v. Chicago etc. Ry. Co.*:

'A theory cannot be said to be established by circumstantial evidence, even in a civil action, unless the facts relied upon are of such a nature, and are so related to each other, that it is the only conclusion that can fairly or reasonably be drawn from them. It is not sufficient that they be consistent, merely, with that theory, for that may be true, and yet they may have no tendency to prove the theory.'

“The case of *Smith v. First National Bank* is well in point. It was an action to recover the value of bonds deposited with the bank for safe-keeping and alleged to have been lost through its negligence. There was no evidence of negligence, except that which resulted by inference from the fact of loss, and the surrounding circumstances were such as to leave it equally open to inference that the bonds had been stolen by one of several persons who had access to the vault in which the bonds were kept. For a loss in the latter mode the bank was not responsible. The court, after observing that the plaintiff had the burden of proof, and that its evidence failed to exclude the possibility of loss by other means than negligence of the defendant, and left the case to be decided by mere inference, without any facts to determine which inference was correct, said:

‘There being several inferences deducible from the facts, the plaintiff had not maintained the proposition upon which alone he would be entitled to recover. There is strictly no evidence to warrant a jury in finding that the loss was occasioned by negligence and not by theft. When the evidence tends equally to sustain either of two inconsistent propositions, neither of them can be said to have been established by legitimate proof. A verdict in favor of the party bound to maintain one of those propositions against the other is essentially wrong.’ ”  
(pp. 278-280.)

The admission of such evidence could not but seriously prejudice the defendant, and when, as here, it was allowed to be piled up cumulatively by witness after witness, it was bound to exert an extremely prejudicial effect.

#### PART IV (c).

**The evidence as to the practice of certain other concerns unconnected with defendant, of calling or describing as "gasoline" material shipped or produced by them, said material in some instances shown to have been different from, and in other instances not shown to be of the same character as, that shipped to defendant, and the material circumstances surrounding such description being expressly shown in some cases to have been different from, and in no case shown to be the same as, those surrounding the shipments to defendant, was inadmissible for the purpose for which admitted, i. e., of proving the proper name of the commodity shipped to defendant; and it was not competent to establish a custom by showing individual instances.**

This evidence is the subject of the following assignments of error: XVIII (*Rec.*, pp. 1569-1577) testimony of the witness Haigh (*Bill of Exceptions, Rec.*, pp. 394-408), Superintendent of the Ajax Gasoline plant, that he considered and shipped the material produced by his plant as "gasoline," it in fact being blended down to a gravity of 56 to 58 degrees, the proportions being one of the casinghead to three of naptha (just the opposite of the Gypsy Company blend), and the product a finished gasoline shipped direct to market: XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI (*Rec.*, pp. 1577-1587), testimony of the witness League, a carrier Bureau of Explosives Inspector (*B. of E., Rec.*, pp. 408-456), in substance, that the material shipped by the Gypsy Oil Company was the same both before and after December 2, 1916, and was called by the superintendent of the Gypsy Com-

pany "casinghead gasoline" (*Rec.*, pp. 408-418), the witness not being shown to be qualified to know whether the material was the same; that Chestnut & Smith (unconnected with defendant) manufactured a blend of raw casinghead and naphtha which they described and shipped as "gasoline" (*Rec.*, pp. 421-424); that D. W. Franchot (also unconnected with defendant) did likewise (*Rec.*, pp. 425-426); that the Totem Gasoline Co., Oil States, Ajax, Tribes, Eagle, Consumers, Victor, Tidal, Ohio Cities and Gilliland Gasoline Companies (all unconnected with defendant) did likewise (*Rec.*, pp. 426-428), although he could not say the degree of blending or proportions in any instance, but knew there was very wide diversity in that respect, the proportions of blending material involved running all the way from 25% to 95%, and some of it being shipped direct to market for consumption, although the raw casinghead was generally shipped to refiners to be blended; that although the safety rules and tariffs required raw casinghead of over 10 pounds vapor tension to be called "liquefied petroleum gas," no distinction was made by these people (other than in shipping), it being commonly called "gasoline" by them, although "liquefied petroleum gas" is a most accurate name; and when these people attempt to speak accurately about a blended product they do not call it just "gasoline," but use some prefix such as "naphtha blend," "kerosene blend," "blended gasoline," etc.; that he has tested "ordinary gasoline," such as is commonly sold for consumption, and found its vapor tension to range from 1 to 7 pounds (the latter being quite unusual) (*Rec.*, pp. 441-448), whereas material shipped by the Gypsy Company had a vapor tension of 6 to 10 pounds (*Rec.*, pp. 415, 450-454), and in all of the cases testified to by him it was not shown that there were any rates in effect on unrefined naphtha, making possible the use of that description or any description but "gasoline" (*Rec.*, pp.

448-450); and his testimony that in calling the unblended casinghead "raw casinghead" he did not mean to intimate that it was in a crude or unrefined state (*Rec.*, p. 451), his previous testimony having been as to the use of the term by others engaged in the business (*Rec.*, p. 435), not by himself, and he not being qualified to express an opinion (*Rec.*, p. 453): XXVII (*Rec.*, pp. 1587, 1588), the testimony of the witness Scott (*B. of E.*, *Rec.*, pp. 456-461), another safety inspector, in substance, that at several plants he had inspected it was the custom to call blended material produced by them "gasoline," some blends being kerosene and others naphtha blends; there being no showing whatever of similarity of these blends to the Gypsy Company's blend, and it being further shown that his contact with such parties was limited to their shipping relations, and there being no showing that there were "unrefined naphtha" rates available, or any other than "gasoline" rates: XXVIII (*Rec.*, p. 1588), testimony of witness Barnhardt (*B. of E.*, *Rec.*, pp. 461-465) that D. W. Franchot, with whom he was connected, was accustomed to ship his product as "gasoline"; it not being shown to be identical with that shipped by the Gypsy Company, and there being no showing of any choice of rate descriptions being available: L (*Rec.*, p. 1602), the testimony of the witness Freeman (*B. of E.*, *Rec.*, pp. 615-618) of the Carter Oil Co., that tops shipped by it from Carterco, Okla., to Baton Rouge, La., under the description "crude unfinished naphtha," were produced by a skimming plant, whereas his testimony showed that this description was not limited to products of skimming plants; and LXXXI (*Rec.*, pp. 1640-1645), denial of motion to strike out all of the foregoing evidence (*B. of E.*, *Rec.*, pp. 625-630, 897).

The admission of this evidence constituted an even more violent disregard of the fundamental principles of the rule under which evidence of *res inter alios acta* may

be admitted, for the reason that this evidence related not to defendant's course of conduct at other times and under other circumstances, but to the conduct of *third persons* at other times and under vitally different material circumstances in many respects. Generally speaking, the acts and declarations of strangers to the transactions under inquiry are not admissible at all, *first* because they are pure hearsay, and *second*, because they are even more remotely collateral than those of the defendant. They, of course, could not bind the defendant as admissions, and the only probative force they could have would be to attempt to establish a fact by showing a general custom. An exception therefore is made to the rule against the admission of declarations or acts of third persons, to the extent that where the material circumstances involved are substantially similar they might have a tendency to establish the existence of a certain state of affairs. In this case, however, the evidence was offered on the theory of establishing a custom in the business of calling the material in question gasoline. It is not competent, however, to attempt to establish a general custom by showing individual instances. As was pointed out on the trial, the Government might call twenty witnesses to prove that they individually called the material gasoline; the defendant might in turn call fifty witnesses to prove that they individually did not, and the trial drag on to the end of the court's patience as to numbers of witnesses without having established anything warranting a reasonable inference. If, for example, there were 1,000 people engaged in the industry, and the Government called 20 witnesses, as above suggested, the defendant 50, and the Government 30 more on rebuttal, there would be the evidence of but ten per cent of the industry, and that equally divided, and no basis whatever laid for any conclusion as to what the general custom was.

Wholly apart from this objection, a mere review of the evidence shows that as to none of it was identity of material circumstances established, but as to much of it cross-examination, and in some instances the direct examination, established that the material circumstances were in fact vitally different. Take, for example, the testimony of the witness Haigh, to the effect that the material produced and shipped by his plant was shipped as gasoline. The evidence shows that it was an entirely different material from that shipped to defendant, that it had been blended down to a gravity of 56 to 58 degrees by using three parts of naphtha to one of casinghead material—just the opposite to that shipped to defendant—and which made the material one substantially similar to that originally produced by defendant called blended gasoline, and which it is conceded ought to have been shipped and classified as gasoline. His testimony further shows that it was a finished gasoline and was shipped direct to market. Such evidence, therefore, could not have the slightest tendency to establish either that the material shipped to defendant was gasoline or that there was any custom so to consider it.

As to the witness League's testimony, to the effect that a number of plants named by him were accustomed to shipping their product as gasoline, it showed that he could not state the degree of blending or the proportions in any instance, but knew there was a wide diversity in that respect, the proportions of blending material involved running all the way from 25% to 95%, and some of it being shipped direct to market for consumption. It is clear that among the materials embraced in his testimony there was undoubtedly much that ought to have been considered gasoline; and his testimony further discloses that the material shipped by the Gypsy Oil Company had a vapor tension of 6 to 10 pounds, whereas "ordinary gasoline" (his expression) has a vapor ten-

sion ranging from 1 to 7 pounds, the latter however being quite unusual.

The same is true of the testimony of the witnesses Scott and Barnhardt; and in all the cases covered by these exceptions there was no showing in any instance of the existence of any unrefined naptha rates which might have been used.

On apparently the same theory the witness Freeman was permitted to testify that the material shipped by his company as crude unfinished naptha was the product of a skimming plant, supposedly to establish that that name was applicable only to the product of a skimming plant. Yet his cross examination showed that the name was not so limited, but that the operation of a skimming plant was but one method of producing the material which might properly be designated by the name "unfinished naptha."

The only respect in which this testimony showed any similarity of circumstances (in connection with the business of these third parties to that of the defendant) was that the material was produced in each case by a casing-head plant. As was shown, however, by the testimony of several witnesses—and it is a fact as to which there is no possibility of dispute—casinghead product may enter into finished gasoline to the extent of anywhere from 5% to 30%. Under these circumstances, it would have been just as reasonable to have admitted evidence of the shipment of ordinary finished commercial gasoline under the name of gasoline, by any third party, anywhere in the United States, as evidence of the existence of a custom of calling casinghead product gasoline. And it must be remembered that the only theory of establishing such an alleged custom was that if there was such a custom it indicated that the material was gasoline. Of course, if the material were in fact not gasoline, it would be utterly irrelevant that there might be a universal custom to so

call it. If the shoe were on the other foot, if, for illustration, the material were indubitably unrefined naphtha, and suppose unrefined naphtha rates were higher than gasoline rates, and suppose further that a defendant was indicted for shipping the material as gasoline, the Government, and particularly the Interstate Commerce Commission, would be the first to object to the defendant even attempting to show any custom of calling the material gasoline. And unquestionably the defendant would not be entitled to show any such fact in a civil case wherein was involved the determination of what rate was legally applicable; and even in a criminal case the evidence could be admitted on behalf of the defendant only on a question of intent, and not at all to negative the fact that the unrefined naphtha rate was legally applicable.

In connection with the evidence herein discussed, consideration should be given to that discussed under subdivision (i) of this Part (*post 183*), which was rejected by the court when offered by the defendant as evidence, although it was of a much higher character and negated the existence of a general custom to consider the material involved as gasoline.

It is difficult to understand upon what assumption the Government should have been allowed to introduce evidence of this class, and the defendant denied opportunity to meet it with evidence of the same general class but of much better quality. One such piece of evidence tendered by the defendant, and rejected, was a statute of Texas making it a crime to describe this material as gasoline, for purposes of shipment or sale. And the only explanation of the court's course in rejecting that evidence was the suggestion by him that the statute might have been passed at defendant's instance. While, of course, such was not the case, it is perfectly apparent that if it had been, and that fact made it objectionable or qualified it in any way, it would have been open to the Government to so prove.

The authorities cited under the preceding subdivision are all not only directly in point as to the evidence here under consideration, but the evidence is more definitely inadmissible for the reason that being declarations of others not connected with defendant, they do not come within the exception to the hearsay rule that would apply to admissions of a party.

On the theory of proving a custom or usage, they fail in substantially every particular. While it is rather a novelty to attempt to bind a defendant in a criminal prosecution by usage, still it must be that the rules applicable to proof of usage in criminal cases can certainly be no less strict than in civil cases.

To prove a custom or usage, it must be shown to be certain and uniform to be binding.

*12 Cyc. 1035.*

It must be shown to be consistent, for if it appears that there are contradictory usages they destroy each other as such.

*Ibid., 1037.*

It must be shown that the party sought to be bound had knowledge of the usage.

*Ibid., 1039.*

The evidence to establish it must not be of isolated instances but must be general and must be known.

*Ibid., 1040-1043.*

When a word has been defined by statute, custom or usage become void.

*Ibid., 1055.*

When words of a statute are ambiguous, then only can usage be resorted to to determine their meaning.

*Ibid.*, 1058, 1059.

While words are to be construed according to their plain, ordinary and popular meaning, yet if in particular situations, they have acquired by usage a different meaning, evidence may be taken to show such special meaning, and it may also be taken to show the meaning of technical words or words peculiar to sciences or arts or particular trades, or to determine the meaning of ambiguous words.

*Ibid.*, 1081.

If it be assumed for the moment that it would have been competent in this case to have attempted to show a usage to the effect that the material involved was called gasoline (which, for the reasons later shown, it would not be), it is submitted that the evidence involved fails to meet every one of the necessary attributes of proof of usage. It fails to show that it is certain or uniform. On the contrary, it shows great uncertainty and lack of uniformity.

The witnesses conceded that there were also used numerous other names, such as casinghead gasoline, raw casinghead, naphtha blend, kerosene blend, etc.

The evidence is not consistent, but directly contradictory. It shows that in many thousands of instances the defendant was accustomed to using the description "unrefined naphtha." There is no more ground for imputing usage to the course of others than to the course of defendant. There is just as much ground for asserting, based on the course of defendant, that the usage is to call the material "unrefined naphtha," as to assert the opposite.

There was no showing whatever of a knowledge of the defendant of such usage of others which would be necessary in order to bind it.

The evidence is not of a general custom common to the locality, common to the trade, or common in any respect, but is simply of individual instances. It is perfectly clear that evidence of such a character can establish nothing on the point of usage.

It fails again in the light of the Texas and Oklahoma statutes (the very locality involved), in that those statutes, in defining the word "gasoline" so as to exclude this material, have established a rule of law that would render void any supposed usage if sought to be offered to construe a contract. Surely, if in a civil case involving a contract for the sale of gasoline the proponent took the position here taken by the Government, in effect that he could deliver this material as gasoline, and offered proof of usage to the effect that this material was called gasoline, and such showing was of a usage directly contrary to the statutes of the states involved, it is obvious that he would not be permitted to make it.

The foregoing discussion, however, demonstrates the utter impropriety of attempting to prove the fact in issue by attempting to show a usage. If usage would decide the question, then defendant's usage being the only one in which the circumstances were identical, would be absolutely controlling and conclusive against the Government.

Under some circumstances it might be competent to attempt to draw an inference circumstantially that a certain material was gasoline from the fact of a usage to so call it; but, in a case of this kind, where the very question itself is *regardless of usage what is the material*, usage would be utterly irrelevant.

As previously pointed out, the published rates and descriptions *are the binding legal* rates and descriptions, and all the custom in the world would not permit a variance from them.

Assume, for example, that there was a classification on rum and another classification naming higher rates on whiskey. Now, it is a notorious fact, of which judicial notice has been taken, that there is a common usage to embrace rum, whiskey and gin under the one appellation "rum." Yet, a defendant who might under such circumstances have shipped whiskey under the description "rum," in order to procure transportation at the lower rate, would not even be heard to contend that he was entitled to do so, based on the common application of the appellation "rum" to whiskey. The reason is perfectly apparent, and it demonstrates why all the evidence of shipment as gasoline, where there were no unrefined naphtha rates in force, was improper. It is because of the surrounding *material circumstances*. In many situations, proof of common usage to call whiskey "rum" would be perfectly proper. But, where it is the essence of the case as to whether or not the material was in fact rum or whiskey, obviously such usage would be entirely irrelevant.

This brings us back to the subject considered under subdivision (a) hereof. *First*, if the word "gasoline," as used in the tariffs, is a common, ordinary, unambiguous word, it was then the duty of the court to construe it and instruct the jury, and was not the subject of evidence; and it is not competent to show a usage concerning common, ordinary, unambiguous words. *Second*, if on the contrary, as used in the tariffs, "gasoline" is not a common, ordinary, unambiguous word, but one having a technical, scientific or special trade application, then, while it would ordinarily be competent for the court to take proof of usage to establish such meaning, *it would not be in cases of this character, because jurisdiction for the purpose of producing uniformity is confided exclusively in the Interstate Commerce Commission, as pointed out by this Court in the American Tie & Timber case, as shown in subdivision (a) hereof.*

## PART IV (d).

**Evidence that the Texas Company paid gasoline rates on certain shipments to it was not competent to prove an unlawful discrimination in favor of defendant; and refusal of the court to allow defendant to show that the Texas Company subsequently sued to recover excess of gasoline rate over unrefined naphtha rate was highly prejudicial.**

Assignments of error as follows, cover this evidence: XVI (*Rec.*, p. 1558), the testimony of the witness Anderson (*Bill of Exceptions*, *Rec.*, pp. 327-339) and Government Exhibits 22 to 25, inclusive (*B. of E.*, *Rec.*, pp. 972-978) being shipping orders covering shipments to the Texas Company described as "gasoline," said Anderson being superintendent of the Totem Gasoline Company, and testified that his company had shipped material which he said was "blended gasoline" (*Rec.*, p. 332), using the description "gasoline" in shipping to the Texas Company, it not being shown whether the material shipped was of the same degree of blend as that shipped by the Gypsy Company, and not shown that the witness knew of the existence of "unrefined naphtha" rates: XVII (*Rec.*, pp. 1564-1569), testimony of the witness McCarroll (*B. of E.*, *Rec.*, pp. 340-345), superintendent for Crosby & Gillespie, to the effect that a blend of casinghead and naphtha shipped by them to the Texas Company was described as "gasoline"; LXIX (*Rec.*, p. 1625), refusal of the court to permit defendant to introduce evidence showing that the Texas Company subsequently sued to recover excess of gasoline rates over "unrefined naphtha" rates on the ground that the latter was applicable, Exhibit 142 for identification (*B. of E.*, *Rec.*, pp. 1463-1469; and *Rec.*, pp. 785-787): LXXX (*Rec.*, p. 1638), denial of motion (*B. of E.*, *Rec.*, p. 627) to strike from the record evidence (admitted by defendant, subject to exception)

(*Rec.*, pp. 625-630, 897) to the effect that certain shipments of casinghead blended with about one-third naphtha were made to the Texas Company, upon which it paid gasoline rates as described in the shipping orders (*B. of E.*, *Rec.*, p. 382).

The 36th to 40th counts, inclusive, and 81st to 85th counts, inclusive, of the indictment attempt to charge the acceptance of a concession whereby property was transported at less than the lawful rate and whereby a discrimination was practiced in favor of the defendant and against the Texas Company.

It is obvious that there might be either a discrimination against the Texas Company or a discrimination in favor of defendant. It is perfectly clear that a discrimination against the Texas Company is not a thing for which defendant could be indicted upon the theory of a discrimination in favor of the defendant. If, for example, the lawful tariff rate applicable was the rate on unrefined naphtha which defendant paid, it would be utterly immaterial in this case, and the defendant could not be charged with fault, if the Texas Company paid the gasoline rate and thus was overcharged. There is not a shred of evidence to show that the defendant knew anything about the Texas Company's affairs or in any way sought to induce the carriers to prefer it as against the Texas Company. The evidence shows, however, that the Texas Company did receive several shipments of apparently similar material at its refinery at Port Arthur, which had been billed and described by the shipper, itself in some cases, as gasoline and upon which the gasoline rate was assessed. There was not the slightest evidence however offered by the Government indicating that the Texas Company knew of the existence of the unrefined naphtha rates, from which it might be inferred therefore that it had chosen the gasoline rate as being the applicable description. On the other hand, the defendant offered to prove (*Ex. 142 for Id.*, *Rec.*, p. 1463), but was denied per-

mission to do so, that the Texas Company, after having paid the gasoline rate on the shipments involved, instituted suit against the carriers for the recovery of the excess of the gasoline rate over the unrefined naphtha rate. While one count of the Texas Company's suit rests on the ground that it had been discriminated against, the other count does not rest on such ground, but squarely on the ground that the unrefined naphtha rates are the only rates properly applicable and that it, the Texas Company, had been overcharged, (*Rec.*, pp. 1467, 1468).

While it is conceded that evidence concerning what the Texas Company paid under like circumstances would be admissible upon the charge of discrimination, *provided* it was established that defendant had been accorded less than the legal rate, and the Texas Company assessed the legal rate, still in the absence of such proof, the admission of that evidence simply begs the whole question. It of course could not tend to establish the fact as to which rate is legally applicable. That is of course a legal conclusion. The only thing it can be assumed to attempt to establish would be that the material was gasoline. When, however, it appeared that the Texas Company had, unconscious of its rights, mistakenly described the material as gasoline, and paid charges at gasoline rates, the fact that it had done so loses all probative force toward establishing that the material was in fact gasoline.

Apart, therefore, from the question of the propriety of admitting the evidence in the first instance as to what the Texas Company had done, it is apparent that the exclusion of evidence offered by defendant tending completely to negative and explain away any inference which might have been drawn from its previous course, was most highly prejudicial, unjust and unfair to defendant. It is difficult to conceive of anything that would more completely destroy any inference that the material in fact was gasoline drawn from the fact that the Texas

Company had described it as gasoline and paid the rates applicable thereto on it, than the fact that the Texas Company was now prosecuting a suit against the Director General for the recovery of the difference between the unrefined naphtha rate and gasoline rate, on the ground that the material was in fact unrefined naphtha and entitled to move on the unrefined naphtha rate.

This evidence should have been admitted for the further reason that in view of the court's having admitted the evidence upon the theory of showing a usage, discussed in the preceding subdivision, this evidence would be directly relevant to rebut any such supposed usage, because here it is the *sworn statement* of one of the concerns whose practice had been cited towards establishing such usage, to the effect that said practice had been followed through error, and asserting that it was not only not correct, but, in addition to this, directly and assertively contradicting the inference sought to be implied from the supposed usage.

Where evidence of the character discussed in subdivisions (b) and (c) hereof has been admitted, even without objection as to its relevancy, it is generally held error to deny the right to the opposing party to show the same character of evidence; and where it is admitted over objection, as was the case here, it is universally held error to deny the opponent the privilege of showing the same character of evidence.

1 *Wigmore on Evidence* (2nd ed.), Secs. 34, 35, 36.

**PART IV (c).**

**Evidence that certain witnesses had operated automobiles with insufficiently identified materials, admitted as tending to show that proper name of material shipped to defendant was gasoline, was incompetent and prejudicial.**

This evidence is the subject of the following Assignments of Error: LVI (*Rec.*, pp. 1605-1609), testimony of the witness Downing (*Bill of Exceptions, Rec.*, pp. 810-814), manager for Crosby & Gillespie, that he used the product of their casinghead plant to run his car, the material not being shown to be similar even to that shipped to defendant, and the witness being unable to give even the gravity of it: LVIII, LIX (*Rec.*, pp. 1612-1615), testimony of witness Dykema (*B. of E., Rec.*, pp. 830, 831), an expert called by the Government, that in his opinion a material even lighter than one he used the night before would run a car (*Rec.*, pp. 825-827); the testimony of the same witness that the "product from the compression of natural gas" is commonly known as gasoline (*B. of E., Rec.*, p. 840); LX (*Rec.*, pp. 1615, 1616), the testimony of the witness DeBar (*B. of E., Rec.*, p. 882), another Government expert, to the effect that he had run cars several hundred miles on casinghead material, not identified as being even similar to that shipped defendant, and some shown to be in fact different and other to have come from a different locality; and LXXXI (*Rec.*, pp. 1640-1645), motion to strike out the foregoing evidence (*B. of E., Rec.*, pp. 625-630, 897).

This evidence is substantially similar in character to that discussed under subdivision (c) of this Part, and as it is subject to the same criticisms and governed by the same authorities, it will not be discussed at length.

Three witnesses were permitted to testify in substance that they had operated motor cars on material a portion or all of which was casinghead product. No attempt was made however to identify the character of the material as being identical with or even substantially similar to that shipped to defendant.

This evidence, however, is subject to further objection as well. It was a purely collateral question as to whether some other casinghead material might or might not run a car. The only thing that was in issue grew out of the definition of all the witnesses for the defense of gasoline as being a material suitable for use in running a motor car under ordinary circumstances. It is not a corollary to this that any material that would under any circumstances propel a motor car is gasoline. On the contrary, the evidence of more than one witness showed that they had personally known of instances of crude oil actually running a motor car. Of course, no one had the temerity to claim that crude oil was gasoline.

The witness DeBar, who was permitted to testify that he had run cars several hundred miles on casinghead material procured from other localities, and not identified as being even similar to that in issue, showed on cross examination that while it was possible for an expert like himself to use the material, it was not suitable for the "common people" to use, and that he was not willing to trust his wife to use it. It is apparent therefore that his testimony could have no value whatever towards attempting to establish that the material shipped to defendant was gasoline, *first*, because the material he was talking about was not necessarily the same material as that shipped to defendant, and *second*, that it did not tend in the slightest to indicate that the material came within the definition "gasoline" above mentioned, but, on the contrary, expressly showed that it was not a suitable material for ordinary use.

This evidence again illustrates the impropriety of attempting to prove a custom by individual instances. Here were three witnesses, two of them offered as experts, and the third from his occupation apparently expert in the handling of the material, so that even if it were assumed that the material used by them was identical with that shipped, the mere fact that they, experts, had been able to use it to propel a car could have no probative force whatever to establish that it was suitable for ordinary use. And, as above pointed out, it was conceded by one of them that his ability to use it depended upon the fact of his being an expert, and that it was not suitable for ordinary use.

#### PART IV (f).

**Admission, over objection for lack of proper foundation, of testimony as to an alleged test by a Government expert, which was subsequently shown to have been a false test, was highly prejudicial even though subsequently stricken out.**

Assignments of Error LV and LVII (*Rec.*, pp. 1602-1605, 1609). During the trial one of the Government experts, W. P. Dykema, accompanied by other Government witnesses, but not by any one connected with the defense, attempted to make a test to demonstrate that raw casinghead would run an automobile without difficulty. He proceeded to the town of Jenks, and procured from a casinghead plant adjacent to one of the Gypsy Company's, a quantity of raw casinghead, which he placed in the car. The witness Moss, an attendant at the casinghead plant, was permitted to testify that he furnished the material, saw it placed in the car, and saw the car driven off, in the face of objection to his testimony on the ground that he was unable to say definitely whether or not Dykema had drained the reserve tank of the car (*Rec.*,

pp. 807-810); and, following him, Dykema was permitted to testify (*Rec.*, pp. 824-828) that he used the material procured at that plant and drove the car into Tulsa from Jenks upon it without difficulty. This in the face of insistent objection upon the ground that there was no proper foundation for his testimony, in that he himself, on preliminary cross examination, admitted that he did not know whether or not he had completely drained the car, and that he did not know whether the car had a reserve tank, and that if it had he of course had not drained it (*B. of E.*, *Rec.*, pp. 824-828).

The defendant fortunately was able subsequently to find and produce the chauffeur of the car used in the alleged test, and to prove that the car did in fact have a reserve tank, which was not drained, as a result of which the actual fact was the car was propelled by the ordinary gasoline instead of the casinghead product (*Rec.*, pp. 892, 896).

While the court thereupon struck out Dykeman's testimony, its admission, in the face of the preliminary cross examination showing that the witness would manifestly be incapable of giving honest testimony on the subject, was clearly an abuse of discretion, and it was highly prejudicial to the defendant, because, by reason of the manner in which the court cross examined the chauffeur, the jury could not help but have been left in doubt as to whether the chauffeur or Dykema had testified untruthfully. The jury might very readily have suspected either that the chauffeur was testifying untruthfully or that Dykema had been deliberately imposed upon. The instructions of the court to disregard Dykema's testimony on the subject could not in such circumstances have cured its improper admission. Dykema, being an alleged expert, certainly ought (as the court subsequently stated) to have made a careful examination to ascertain whether the conditions were proper to afford an honest test, and

his failure to have done so, demonstrated by preliminary cross examination, ought to have warned the court that his testimony was liable to be either wilfully false or wantonly reckless, and under such circumstances the court ought not have permitted him to proceed with giving his testimony and to have placed the burden upon the defendant of procuring the necessary evidence to establish its falsity. That the defendant was able successfully to do so, however, did not cure the situation; for, as above pointed out, the jury might readily have reached a mental conclusion, notwithstanding the court's instructions, that the chauffeur rather than Dykema testified falsely. The court, being as it was on notice of the existence of the question whether or not the reserve tank had been drained, ought to have placed the burden on the Government of ascertaining and proving the fact before admitting further testimony about the matter, and had this been done the result would of course have been that neither Dykema nor the chauffeur would have testified further in relation to the matter, and there could have been no question of veracity between them.

#### PART IV (g).

**The admission, before the establishment of the *corpus delicti*, of evidence supposed to tend to establish intent was improper; and the evidence in question was not competent for the purpose for which it was admitted.**

Assignments of Error XXVI, XXXVII (*Rec.*, pp. 1598, 1599), XLVI (*Rec.*, p. 1601), LXXXI (*Rec.*, pp. 1640-1645) cover the evidence involved. It consists in Government Exhibits 66 (*Bill of Exceptions, Rec.*, pp. 1272, 1289), 77 (*B. of E., Rec.*, pp. 1295, 1300), 78 (*B. of E., Rec.*, pp. 1301-1307), 100 to 102, inclusive (*B. of E., Rec.*, pp. 1383-1405), being books containing records of distillation tests, and Exhibits 80 to 84, inclusive (*B. of*

*E., Rec., pp. 1308-1362*), being statements showing the quantity of casinghead material received at the refinery at Port Arthur. Assignment LXXXI (*Rec., p. 1640*) covers the denial of the motion to strike out this evidence (*B. of E., Rec., pp. 625-630, 897*).

It appeared that there had been a practice to enter in the distillation test record, upon the tests of consignments of casinghead material, the data shown by the test, together with a description sometimes reading "Kiefer gasoline," sometimes reading "Kiefer gas," and sometimes reading "Kiefer" (Kiefer being the name of the point of origin) up until June, 1917, after which time the description read "unrefined naphtha"; and in these records wherever the word "gasoline" or "gas," following the word "Kiefer," occurred previous to June, 1917, they had been erased (*Rec., pp. 500-520*). Exhibits 80 to 84, inclusive, were monthly statements, the originals of which were sent to the general office at Pittsburgh, and the duplicates kept at the refinery at Port Arthur, which showed the receipts of casinghead material at the refinery, and until the month of June, 1917, the headings on these statements had read "Receipts of Kiefer gasoline," and from June, 1917, they read "Unrefined naphtha from Gypsy Oil Company." On the duplicate copy of these statements kept at the refinery the headings had been cut off up to the month of June, 1917. These records and statements were admitted on the theory that the earlier use of the term "gasoline" constituted an admission, and that the erasures and deletion thereof indicated conscious guilt, and that they were therefore admissible to establish intent. At the time they were admitted the Government had offered no direct evidence whatever to establish that the material shipped was in fact gasoline, but it simply offered the evidence hereinbefore considered, to the effect that under certain different circumstances the Gypsy Oil Company, the defendant, and other parties not con-

nected with the defendant, called or shipped the material as "gasoline."

There was no evidence tending to show when, where or by whom the erasures and deletions were made, other than the defendant admitted that they existed at the time the books and statements were turned over to the Government upon the grand jury inquiry (*Rec.*, pp. 500-508).

It was shown, however, that at or about the time the practice arose (December 2, 1916), of describing the material for shipment as "unrefined naphtha," instructions were issued at the refinery to employees to use that name thereafter in describing the material (*Rec.*, pp. 495, 501).

It was further shown that the entries in the distillation test books, which were merely lead-pencil blotters, were made by laboratory test boys, whose sole duty it was to put down the results of the tests which they made, and whose duty did not involve characterizing or describing or classifying the material in any way, and who were shown to be unequipped to be capable of doing so (*Rec.*, pp. 290-303, 468-474, 489-497).

It was also shown that the originals of the statements Exhibits 80 to 84 had not had the heading "Kiefer gasoline" deleted, but that they remained as originally written (*Rec.*, pp. 1354, 1359).

It was not shown that the erasures were made by or at the instance, or with the knowledge or consent, of any one within the scope of whose employment matters affecting freight rates and classifications were embraced; and there was no evidence from which even an inference might be drawn that any one having anything to do with freight rates and classifications ever saw or even knew of the existence of the records in question.

It is therefore apparent (a) that the evidence was not even competent to prove intent, and (b) that its admission on that theory, before the establishment of the *corpus delicti*, was bound to be highly prejudicial.

(a) Evidence to be admissible solely on the ground of establishing intent, ought to be of such a character that it could be explained upon no other reasonable hypothesis.

The most natural, reasonable and plausible explanation as to how these erasures and deletions occurred is apparent from the evidence. The boys handling these records had been given certain instructions, which they failed to carry out at once. Upon finding the matter becoming the subject of inquiry, it was the most natural thing conceivable that they would endeavor to conceal their failure to carry out instructions by making these erasures. It should all the while be borne in mind that before these entries could rise to the dignity of being considered admissions that the material was in fact gasoline, it would have to appear that the entries were made at least by some one within the scope of whose employment there was embraced the designation or classification of the material; and the evidence clearly showed that these boys had no functions of this character. And it should likewise be not forgotten that the very fact that the name "gasoline" when so used was always qualified with the prefix "Kiefer" is evidence of recognition of a distinction between that material and the material ordinarily known as "gasoline." On the other hand, in the light of the fact that the permanent records at Pittsburgh were not changed, nor any other record, the fact that it was freely admitted by defendant that it had been its practice to call the material "Kiefer gasoline" and "casinghead gasoline," and that on shipping orders previous to December 2, 1916, to Port Arthur, and at all times to Pittsburgh, it called the material "gasoline," all of which it freely admitted; it is not even a reasonable assumption that the erasures and deletion in question could operate as an attempt at concealment, the only theory upon which they could be supposed to be evidence of intent.

Intent to be imputed to the defendant from the act of some employee must be the act of an employee having at least a reasonable degree of relationship to the subject-matter involved. The intent would consist in an intent to procure an unlawful concession in relation to the transportation of property. An act done by some employee of the Company before or about the time of the transportation, which would have a tendency to bring about such a result, might reasonably be considered to be evidence of the existence of an intent to do it. But evidence of an act done subsequently, to be admissible at all, must be of a character betokening conscious guilt, such as flight, concealment or destruction of weapons, etc.; and it is perfectly obvious that in such case it could only be the flight, concealment or destruction by the person responsible. Here, the records involved are no part of records having anything to do with freight charges or classification matters, and it would have been just as reasonable to have received as evidence of intent the act of any ex-employee having no more to do with the matter than these laboratory boys, in leaving the country, for example, on the theory that it would constitute flight, and thus be indicative of guilt.

In *Elgin, J. & E. Ry. Co. v. United States*, 253 Fed. Rep. 907, the Circuit Court of Appeals for the Seventh Circuit had before it for review the conviction of a railway company under the Elkins Act, and, in considering a portion of the charge of the District Court, which was in substance to the effect that knowledge of various employees of the corporation of various facts, which, if collected into the mind of one agent, would amount to sufficient knowledge of the requisite facts, would be sufficient to impute knowledge to the corporation, said:

“It would seem that, as stating a rule of general application, the charge is too broad, and that under some circumstances it would be error to give it. For instance, if in the case before us there were

evidence that a car repairer or track hand or other like employee of the company actually saw the contents of the cars in question before they were billed out, and knew they contained strawboard and not paper boxes, the jury under such a charge would be required to find that this knowledge of such an employee was knowledge of the Company. But in the nature of things the knowledge of such an employee, who has no function whatever with respect to receiving or classifying freight, and no concern whatever with shipments or rates or tariffs, and no occasion, purpose or duty to communicate to his employer such incidental knowledge thus coming to him, would not ordinarily be the knowledge of the Company. A corporation is not chargeable with knowledge of facts which become known to its agent, unless the agent in the line of his duty ought and would reasonably be expected to communicate the knowledge to his principal. *Neal v. M. E. Smith Co.*, 116 Fed. 20, 54 C. C. A. 226; *Korn v. Chesapeake & Ohio Ry. Co.*, 125 Fed. 897, 62 C. C. A. 417; *Reed v. Munn*, 148 Fed. 737, 80 C. C. A. 215; *Mechem on Agency* (1st ed.), Secs. 718-721; *Tiffany on Agency*, p. 262." (p. 912.)

In *N. Y. Central Railroad Co. v. United States*, 212 U. S. 481, the Court had under consideration the validity of that section of the Elkins Act which imputes the act of an agent within the scope of his employment to the carrier. It is clear from a reading of the opinion of the court in that case that it sustained that portion of the act in question solely because of the limitation therein contained of *acting within the scope of the employment*.

(b) While it is true that not so much attention is paid in the case of misdemeanors as in felonies, to the rule that evidence of intent is not admissible before the establishment of the *corpus delicti*, nevertheless, when, as here, the admission of such evidence produces a situation where it is impossible to judge how far the jury might have been moved to reach a conclusion by this very evi-

dence, of the existence of the *corpus delicti*, it is of course improper to permit its introduction before the independent establishment of the *corpus delicti*.

“f. *Corpus Delicti*. The prosecution has the burden of proving that a crime has been committed before the jury proceed to inquire as to who committed it, and a conviction cannot be sustained unless the *corpus delicti* is clearly established.”

12 Cyc. 382.

“II. *Corpus Delicti*. As a matter of good practice it is preferable to prove the *corpus delicti* before any evidence is offered to implicate the accused; but the matter is largely in the discretion of the court; and while the state may and should prove the *corpus delicti* first, it is not error to receive evidence against the accused before the *corpus delicti* has been proved.”

*Ibid.*, 556.

“The confession or mere statement of the accused is not sufficient to establish the *corpus delicti*. The proposition called the *corpus delicti* must be proven by evidence either circumstantial or positive outside of the confession, declarations, or admissions of the defendant, before such confession, etc., can be taken as sufficient to warrant a jury in convicting.”

5 *Encyclopedia of U. S. Supreme Court Reports* (Michie), 126.

In *United States v. Searcey*, 26 *Fed. Rep.* 435, the court said:

“In all trials for crime the prosecution must prove to the satisfaction of the jury that a crime has been committed before the jury proceeds to inquire as to who is the criminal.”

In *Alberty v. United States*, 162 *U. S.* 499, and in *Starr v. United States*, 164 *U. S.* 627, the Court reversed

convictions on account of a charge (in identical language in both cases) because of improper weight given to a circumstance of flight, a part of the particular charge in question being:

“Flight is always relevant evidence when offered by the prosecution, and that it is a silent admission by the defendant that he is unwilling or unable to face the case against him. It is in some sense feeble or strong, as the case may be, a confession, and it comes in with other incidents, the *corpus delicti* being proved, from which guilt may be cumulatively inferred.”

While, as above pointed out, these cases were reversed upon the ground of improper weight given this evidence by the charge, the order of proof not being in question, since, as shown by the language of the charge, it appeared that the *corpus delicti* was independently proved, yet it is significant that the fact was deemed important.

Wigmore states the rule:

“*Order and Sufficiency of Evidence of Corpus Delicti.*—(a) That the evidence of the *corpus delicti* should be put in *before* the confession is certainly good practice and is occasionally said to be the rule; but the better view is that the trial judge may determine the order of this evidence, on the general principles otherwise prevailing.” (Italics his.)

3 *Wigmore on Evidence* (2nd ed.), Sec. 2073.

See, also:

*Ibid*, Secs. 2072, 2081, 1867, 1869.

In *Goff v. United States*, 257 *Fed. Rep.* 294, the court had before it the review of a conviction upon an indictment charging introduction of liquor into Oklahoma; and the only proof offered by the government was the fact that the defendant had liquor concealed in his automobile,

and no other proof of the fact of its introduction into the state than statements or admissions made by the defendant, which it was insisted were not alone sufficient to establish the fact of such introduction. The defendant demurred to the evidence on the ground that it was insufficient to prove the crime charged, for the reason that the *corpus delicti* was not established. In reversing this conviction, the court reiterated the rule laid down by it in *Naftzger v. United States*, 200 Fed. Rep. 494, as follows:

“A conviction upon extra-judicial confession, or acts or declarations of a prisoner, will not be sustained, without corroborative proof that the property was in fact stolen.” (257 Fed. 296.)

This court further said:

“We do not hold that declarations of a party may not be considered in finding the *corpus delicti*; but, standing alone, they are insufficient, and other facts and circumstances cannot be said to be corroborative, when they point as directly to some other offense as they do to the crime charged.” (p. 296.)

In this case, had the trial court observed this rule the defendant undoubtedly would have rested on the Government's case, and in such event it is inconceivable that the jury would have convicted at all without this evidence; and even had it done so, such a verdict would unquestionably have been set aside.

As the record now stands, this court is unable to determine how much the jury may have been influenced by this evidence in reaching its conclusion that the material could be called “gasoline.” But it is quite apparent that in all probability this evidence was extremely potent in bringing about that conclusion. The very fact that the court admitted it at the time it did could not but tend to influence the jury to regard all subsequent evidence with

suspicion, because of the natural inference that the court, in admitting this evidence on the theory of intent, must have believed a substantive offense existed.

#### PART IV (h).

**The evidence concerning the rates in force does not sustain the charge.**

Assignments of Error LIV (*Rec.*, p. 1602), Government Exhibit 139 (*Bill of Exceptions*, *Rec.*, p. 1461); LXXIV (*Rec.*, pp. 1631, 1632), Government Exhibits 36 to 42 and 45 to 56 (*B. of E.*, *Rec.*, pp. 978-1212) and LXXXIII (*Rec.*, pp. 1646, 1647). Charge (*B. of E.*, *Rec.*, pp. 912-930).

The charge of the court (*B. of E.*, *Rec.*, pp. 912-930), that the rates alleged by the indictment to have been legally established and in force during the period covered by the indictment, for the transportation of gasoline between the points charged, were so established and in force, was based on Government Exhibits 36 to 42, inclusive, and 45 to 56, inclusive (*B. of E.*, *Rec.*, pp. 978-1212), being excerpts from tariffs produced from the files of the Interstate Commerce Commission, which it was maintained by the Government show such facts.

These assignments of error would be pressed with reluctance because of their technical nature, were it not for the fact that the whole prosecution itself depends on the most extreme technicality, when it is remembered that the rates on unrefined naphtha were openly established by the carriers at defendant's request for the express purpose of transporting the traffic involved; that the defendant caused notice to be given to the initial carrier that upon the becoming effective of said rates the commodity theretofore shipped under the description "gasoline" would thereafter be shipped under the new description; that the traffic was openly carried on this de-

scription with full knowledge on the part of the safety inspectors whose duty it was to change the same if erroneous, for a period of two years, when the Government stepped in and said, "You have made a mistake in the choice of name for the publication of rates; we shall take advantage of such mistake and criminally prosecute you." It is of course not conceded that any mistake was made, but confidently asserted that the description adopted was correct and appropriate. Nevertheless, in such a situation, the Government ought in simple justice to be held to the strictest of proof upon the very technicality on which it depends. It maintains, as it necessarily must, that the material shipped is gasoline *as described in the tariffs* which it asserts were effective. Turning then to these tariffs, it is to be observed that every one of the tariffs purporting to name rates on gasoline during the period of time involved refer to and are governed by the western classification currently in force. As an illustration, Government Exhibit 36, Southwestern Lines Tariff No. 26-T, shows on its face that it is governed, except as otherwise provided therein, by the western classification (*Rec.*, pp. 978-982).

Turning to Government Exhibit No. 37, western classification (*Rec.*, p. 1062), we find (*Rec.*, p. 1081) gasoline to be listed *as a petroleum product*, and the basis for computing the weight thereof is of gasoline *as a petroleum product* (*Rec.*, p. 1092). The weights charged in the indictment are, as shown thereby, established on the basis provided by the western classification, and the tariffs are complete only by taking into consideration these provisions of the classification. Consequently, the rates named on gasoline shown by the evidence are on gasoline, *a product of petroleum*, and do not purport to be otherwise.

The evidence in the case is clear, it being admitted even by the Government's own experts, that it is not known whether casinghead gas comes from petroleum at

all or not. Certainly it is not a product of petroleum in the sense of having been produced from it by any human agency. And it may well be the fact that it does not come from petroleum at all, but exists in the same earth chambers with petroleum, independently, however, and originating from other sources (*Rec.*, pp. 676, 890).

In such circumstances, it is obvious that no jury could find beyond a reasonable doubt the essential elements of the alleged offense. Unless the commodity shipped is a product of petroleum, the rates named on gasoline, charged in the indictment, do not cover the commodity shipped at all. This situation applies to every count of the indictment.

The 36th to 40th, inclusive, and 65th to 100th, inclusive, counts of the indictment relate to transportations during the period of federal control, which began December 28, 1917, and continued up to beyond the time dealt with in the indictment. It was and is maintained by the defendant that there were no rates legally in force during this period of time, due to the failure of the Director General of Railroads of the United States to adopt, in the manner and form provided by law, the tariffs of the carrier companies whose properties were taken over by him.

Section 6 of the Interstate Commerce Act, as amended, and necessarily claimed by the Government to be in force at the time involved (*24 Stat. L. 379, 25 Stat. L. 855, 34 Stat. L. 584*), provides that carriers subject to the act shall file with the Interstate Commerce Commission, and print and keep open to public inspection, schedules showing the rates for transportation; prohibits transportation unless said rates shall have been so filed; prohibits changes therein except after thirty days' notice to the Commission and the public, published as required, with the proviso that the Commission may in its discretion, for cause, allow changes upon less than the notice specified,

“or modify the requirements of this section in respect to publishing, posting and filing of tariffs, either in particular instances or by a general order applicable to special or peculiar circumstances or conditions,”

and with the further proviso that the Commission may make suitable rules and regulations governing the form of the schedules; and that

“the names of the several carriers which are parties to any joint tariff shall be specified therein, and each of the parties thereto, other than the one filing the same, shall file with the Commission such evidence of concurrence therein or acceptance thereof as may be required or approved by the Commission.”

And the Elkins Act (*32 Stat. L. 847, 34 Stat. L. 584*), under which this prosecution is brought, makes the offense consist in transportation

“at a less rate than that named in the tariffs published and filed by such carrier, as is required by said Act to Regulate Commerce and the acts amendatory thereof.”

Pursuant to the authority contained in the Act to Regulate Commerce, to prescribe the manner and form of publication and adoption, the Interstate Commerce Commission, with the express purpose of meeting situations substantially identical with those here involved, did establish rules and regulations to cover the adoption by one carrier of rates published by another carrier and in force upon an occasion of sudden transfer of operations from the previous carrier to the second carrier. These rules and regulations are Exhibit No. 57 (*Rec., p. 1212*), being Circular No. 18-A of the Interstate Commerce Commission, which was in force at the time the Director General took over the operations of the corporate carriers (*Rec.,*

pp. 391, 392); and as will be seen by reference to Rules I and J set forth in full on *pages 1213 and 1216 of the Record*, it provides that in case of change of ownership or control of a carrier, the one whose line is taken over shall unite with the other in the publication of a supplement to the existing tariffs on file with the Commission, the former withdrawing and the other establishing such tariffs; that such supplements shall be numbered consecutively as supplements to the tariffs involved; and that if the new carrier intends to use tariffs issued by agents of the old carrier, the new carrier shall

“issue, file and post, with I. C. C. number, and adoption notice substantially as follows:

“The (name of carrier) hereby adopts, ratifies, and makes its own, in every respect as if the same had been originally filed and posted by it, all tariffs, rules, notices, concurrences, traffic agreements, divisions, authorities, powers of attorney, or other instruments whatsoever, filed with the Interstate Commerce Commission by the (name of old carrier) prior to (date) the beginning of its possession. By this tariff it also adopts and ratifies all supplements or amendments to any of the above tariffs, etc., which it has heretofore filed with said Commission.”

And it is provided that such adoption notice may be made effective and filed on immediate notice (instead of the thirty days required by the act).

As further pointed out by the Commission in this circular, a carrier surrendering control of its property has no further right to publish rates, except under proper authority from the carrier to whose control the property passes, and the public has a right to available and lawfully applicable rates over that property.

If it be contended that the Director General was not obligated to comply with these requirements of the law and regulations made pursuant thereto, such contention

admits the argument for defendant in Part II (c) hereof to the effect that the Director General, being not subject to the requirements of the Act to Regulate Commerce, no offense could exist under the Elkins Act in respect to transportation by the Director General, because of the absence of any requirement to establish rates in the manner "required by said Act to Regulate Commerce and the acts amendatory thereof" (Elkins Act, *supra*).

If, on the other hand, it is admitted that the requirements of the Interstate Commerce Act concerning publication and filing of tariffs were in force, then it is perfectly clear from the record that the Director General did not comply with such requirements, and consequently there was no rate legally in force after he assumed control of the properties (*Rec.*, pp. 374-9, 392-4).

The Government attempted to meet this situation by offering in evidence Government Exhibit 139 (*Rec.*, pp. 1461, 1462), which it pretends constitutes such adoption. This exhibit is a circular issued by the Director General of Railroads, being Order No. 1, which recites that the Director General, pursuant to proclamation of the President, has taken possession and control of certain transportation systems, the officers, agents and employees of which are directed to take immediate and careful notice of the proclamation, and, in addition to the provisions thereof, orders that they shall continue in their existing relation, directing the manner of operation, that designation of routes by shippers is to be disregarded when speed and efficiency of transportation service may be promoted, that traffic agreements between carriers must not be permitted to interfere with expeditious movements, that new through routes are to be established, and

"Existing schedules of rates and outstanding orders of the Interstate Commerce Commission are to be observed, but any such schedules of rates or orders as may hereafter be found to conflict with the purposes of said proclamation or with this

order shall be brought immediately by wire to the attention of the Director."

The Government produced as an expert witness an employee of the Tariff Division of the Interstate Commerce Commission, who brought with him from the tariff files of the Commission the schedules assumed to cover the transactions involved in the indictment. He brought all the tariffs and supplements thereof which he found in the tariff files of the Commission affecting the matter, and there was not included among them any supplements of adoption by the Director General of the existing tariffs (*Rec.*, pp. 392-4). Upon objection on behalf of defendant, on the ground of lack of proof of adoption of the tariffs by the Director General, and the intimation of the court that he would hold the proof respecting tariffs during the period of federal control fatally defective for lack of such adoption, then, and then only, did counsel for the Government wire the Interstate Commerce Commission to forward a copy of this order of the Director General, and offered it, together with the certificate of the Secretary of the Commission appended to the exhibit, as establishing such adoption (*Rec.*, pp. 374-9, 392-4). The certificate of the Commission, as will be observed, is carefully worded to go as far as the facts would permit towards creating the impression that the order has been lodged with it as a tariff publication. But the very form of this certificate, by its failure to go that far, convincingly shows, as does the failure of the expert to find or bring it from the tariff files of the Commission, that this order was not filed as any supposed compliance with the requirements concerning adoption of tariffs, but, on the contrary, that a copy was simply sent to the Commission as a matter of information to it and in no sense as a tariff publication.

By reference to Exhibits 36 to 42, inclusive, and 45 to 56, inclusive (*Rec.*, pp. 978-1212), it will be observed that

the tariffs actually coming from the tariff files of the Interstate Commerce Commission all bear on their face a stamped notation, similar to that shown on page 979 of the record, reading:

“Public File. Amended by I. C. C. No. 1186; Effective 5-2-1917. Cancelled by I. C. C. No. 1226; Effective 5-10-18. Received; Interstate Commerce Commission; 4-1-005; June 12, 1914; Division of Tariffs.”

Yet there is no such stamp, nor any other pretense, upon the Director General's order (*Exhibit 139*), indicating that it ever was in the tariff files or considered to be any part thereof. Quite apart from this, it is obvious that this order fails to comply with the form provided by the Interstate Commerce Commission hereinabove set forth for adoption of tariffs. It has no pretense to being a numbered supplement to tariffs, and there is no withdrawal on the part of the carrier corporations. There is no proof whatever of its being published as a tariff supplement, kept open to public inspection, or otherwise treated as a tariff publication. There is no adoption of publication agencies, and several of the exhibits, like Government Exhibit 41 (*Rec., pp. 1110, 1111*), being supposed tariff publications after the beginning of federal control, purport to be issued by agents, not on behalf of the Director General but on behalf of the former carrier corporations (*Rec., p. 1111*).

It should be borne in mind that this is a criminal case, and that certainty is required therein. It is not the defendant that is relying on technicalities, but it is the prosecution which is wholly relying on technicalities, and it should therefore be held to the highest degree of certainty in the attempted establishment of its contention. Such certainty requires, in order to constitute an offense, a showing that there was a departure from rates established and filed in the manner and form *as required by*

the Interstate Commerce Act, and it is submitted that the Government has failed to make the requisite proof on this score.

#### PART IV (i).

**The rejection of evidence offered by defendant showing use of names other than "gasoline", by other parties; the representations actuating the carriers in establishing the unrefined naphtha rates; the fact that the laws of Texas prohibit and make criminal the calling of the material shipped gasoline or gasoline in conjunction with any other word; that the laws of Oklahoma concerning gasoline do not embrace this material; the fact that inspection and taxation by the corporation commission of Oklahoma does not embrace this material as gasoline, —was erroneous.**

Assignments of Error LXII (*Rec.*, p. 1618), rejection of the evidence offered on cross examination of Government witness League showing that there had been a controversy between himself and another inspector of the Bureau of Explosives as to the proper designation of the material shipped by the Gypsy Oil Company, which controversy had been by them submitted to the head of the Bureau of Explosives, who had in turn instructed these inspectors that the description used by the Gypsy Oil Company was proper under the tariffs (*B. of E., Rec.*, pp. 437, 438): LXIII (*Rec.*, pp. 1620-1622), rejection of evidence offered on cross examination by the witness League, who had testified on his direct examination that casinghead producers with whom he came in contact were accustomed to describing their product as gasoline, to the effect that at a meeting of a large number of the casinghead producers of the locality which he attended, there was discussion among them in his hearing of the proper name by which the material should be described and the divergence in nomenclature concerning it as be-

tween the tariffs and the safe transportation rules (*B. of E., Rec., pp. 439-441*): LXIV (*Rec., p. 1622*), rejection of evidence offered upon cross examination of Government witness Powers, to the effect that he had established the rates on unrefined naphtha based on the representations of defendant's traffic manager that it was a low grade article to be shipped, treated and reshipped to Port Arthur to be further finished (*B. of E., Rec., pp. 559-566*): LXV (*Rec., pp. 1622, 1623*), rejection of the evidence offered on cross examination of Government witness Reilly, to the effect that in establishing the rates on unrefined naphtha he was governed by the fact, represented, that it was an unfinished product and that the degree of finishing or refinement or the method of production did not enter into the question of what might be shipped under the description (*B. of E., Rec., pp. 567-573*): LXVI (*Rec., pp. 1623, 1624*), rejection of the statute of Texas (Act of March 24, 1919) offered in evidence, which makes it a criminal offense in that state to describe the material here involved either for purposes of sale or transportation as gasoline or gasoline coupled with any other word (*B. of E., Rec., pp. 722-727, 794-796*): LXXI (*Rec., pp. 1629, 1630*), rejection of section 4353 of the Revised Laws of Oklahoma, offered by the defendant as evidence (*B. of E., Rec., pp. 791-793*) showing that state prohibits sale of this material for domestic uses: LXXIII (*Rec., p. 1631*), rejection of testimony offered (*B. of E., Rec., pp. 884, 885*) on cross examination of Government witness DeBar, to the effect that the State of Oklahoma, through its Corporation Commission, does not treat the material involved as gasoline with respect to taxation and inspection of gasoline.

It is difficult to conceive upon what theory the rejection of this evidence could be justified, in view of the evidence of the Government, admitted in its direct case. We do not contend that the fact that the head of the Bureau of Explosives instructed his inspectors that the descrip-

tion "unrefined naphtha" used by the Gypsy Oil Company was authorized by the tariffs, established that as a legal conclusion. It was not offered or suggested that it was admissible upon any such theory. It would seem, however, to be apparent that it was admissible upon at least two theories: *One*, as cross examination of the witness who had theretofore testified that those with whom he came in contact were accustomed to calling the material "gasoline," whereas here was an instance directly contradictory, of his chief instructing him to the contrary. Apart from this, any number of witnesses had been permitted to testify for the Government that there was a custom of calling the material "gasoline." If such evidence was admissible, clearly the defendant ought to be allowed to show instances of other people pursuing a different course. Here was a man whose functions naturally brought him in contact very much with the subject, and his views of the custom would be of much more value than the ordinary individual's. *Again*, it was a part of his duty to see that the proper descriptions were used, and he was under a legal obligation to prevent the use of the name "unrefined naphtha" on material to which it did not properly apply (*Rec., pp., 435, 436*).

As to the evidence of the meeting of casinghead producers, this was likewise admissible on at least two grounds, *i. e.*, cross examination of the witness and as negating any supposed unanimity of custom. The witness had testified that certain casinghead producers with whom he came in contact were accustomed to calling the material "gasoline." Yet here was a meeting of a majority of the casinghead producers of the locality where the question of proper nomenclature was directly in controversy, thus contradicting the inference sought to be raised from his direct testimony to the effect that there was a custom of calling the material "gasoline," and the evidence likewise tended to negative the existence of any such supposed custom.

While, as maintained under subdivision (3-a) of this Part, it is urged that authority to construe the scope of a tariff classification is exclusively confided to the Interstate Commerce Commission, still, with the trial court denying that view, it became and was most important to ascertain the meaning of the term "unrefined naphtha." This would be so even if the court were of the view that "gasoline" was undoubtedly an appropriate name for the material; for, if "unrefined naphtha" was also an appropriate name, there would of course have been no offense involved in utilizing the description carrying the lower rate. Indeed, there is doubt as to whether it would have been proper to have used the description "gasoline" if the description "unrefined naphtha" would also embrace the material, because the rates under the latter description were put in as commodity rates expressly to cover the traffic. It was contended by the Government that "unrefined naphtha" was not an ordinary term or one in general use, and it was not contended by defendant that it is. Indeed, it is highly improbable that defendant would ever have conceived asking for the establishment of rates upon this description, but for the fact of their establishment in contiguous territory for the traffic of the Carter Oil Company, thus bringing the description, and more especially the basis of a 2-cent differential over the crude oil rate, established by the Commission in the *National Refining Company case*, to the attention of defendant, thus indicating the opportunity to obtain rates on an intermediate basis which it had long sought, to cover the transportation of an unfinished product, asking for them however under the name "gasoline," and which it is shown by the carrier's letters was declined because of the fact that it would disturb the refined oil rate basis.

It is therefore apparent that the term was not an ordinary word as to which the court might have recourse to a dictionary for its interpretation. Indeed, if it was,

it would then have been the duty of the court to have construed it and instructed the jury, and not to have permitted the evidence, as it did, from a number of witnesses upon the question of its meaning. In such case the two best possible sources of evidence as to the proper meaning of the term would be (a) those engaged in the business (and who were heard) and (b) those who established the description and rates.

Messrs. Powers and Reilly were the gentlemen that did the latter. Defendant sought to show that in the use of the words as published by them in their tariffs they had not intended to limit, and therefore had not limited, them to any such construction as that sought to be given it by the Government, of excluding material supposed to have undergone a process of refining by nature under the earth, or one free of impurities, but that they meant merely to provide for the transportation of an unfinished naphtha material. This testimony was of the greatest importance, when it is remembered that the controversy finally resolved itself into merely a question of whether "unrefined" and "unfinished" were synonymous. The Government was ultimately compelled to concede that the material is quite properly denominated "naphtha" and that it was in fact unfinished, from the point of view of being commercial gasoline, in that it needed to go to a refinery for correction of its boiling points before it would be marketable gasoline; and it then shifted to the position that "unfinished" was not "unrefined," and that blending to correct boiling points was not a process of refining.

On the other hand, the evidence of all persons qualified to give testimony concerning the use of the terms "refined" and "unrefined" as a special use applied to the petroleum industry, testified in substance that blending was a part of the art of refining, and that a product unfinished was unrefined until finished, and that a refined product was a finished product. What more conclusive

evidence could there be of the proper definition of the term "unrefined naphtha" used in the tariffs than that the very officers who established it placed the same construction on the term that those versed in the art of refining did.

The statute of Texas (Act of March 24, 1919) which was offered in evidence and rejected, is as follows:

*"Section 1.* It shall hereafter be unlawful for any person, firm, association of persons or corporation, to sell gasoline, benzine, naphtha, or other similar product of petroleum, capable of being used for illuminating, heating or power purposes, under any other than the true name of said products; and such petroleum products shall be subject to inspection by the proper authorities as provided in this act.

*"Sec. 2.* It shall hereafter be unlawful for any person, firm, association of persons, corporation or carrier selling or transporting for hire any gasoline, benzine, naphtha or other highly inflammable substance made from petroleum to fail to plainly mark the packages containing the same in accordance with the regulations of the Interstate Commerce Commission unless such regulations should conflict with the provisions of this act.

*"Sec. 3.* It shall be unlawful for any person, firm, association of persons, corporation or carrier selling or transporting for hire any gasoline, benzine, naphtha or other similar product of petroleum, to fail to truly label in large letters showing the name of the manufacturer and the place of manufacture of the products, any tank car, barrel, cask, tank wagon, receptacle or reservoir in which any petroleum product shall be shipped or stored within this state, or from which sales or delivery of the same are to be made.

*"Sec. 4.* It shall hereafter be unlawful for any person, firm, association of persons or cor-

poration, to sell any product of petroleum to be used for illuminating purposes unless such petroleum product is such that it will not flash at a temperature less than 110 degrees Fahrenheit.

"*Sec. 5.* It shall hereafter be unlawful for any person, firm, association of persons or corporation, to sell as gasoline any substance, liquid or product of petroleum which falls below the standard and definition of gasoline as provided in this act.

"*Sec. 6.* For the purpose of this act the word GASOLINE whether used alone or in connection with other words shall apply only to the petroleum products complying with the following minimum requirements:

"(a) Boiling point must not be higher than 60° C (140° F).

"(b) Twenty per cent of the sample must distill below 105° C (221° F).

"(c) Forty-five per cent must distill below 135° C (275° F).

"(d) Ninety per cent must distill below 180° C (356° F).

"(e) The end or dry point of distillation must not be higher than 220° C (428° F).

"(f) Not less than ninety-five per cent of the liquid will be recovered from the distillation.

"(g) Gasoline to be high grade, refined and free from water and all impurities, and shall have a vapor tension not greater than 10 pounds per square inch at 100 degrees Fahrenheit temperature.

"*Sec. 7.* The apparatus and methods of conducting all tests and arriving at proper standards of gasoline and other products under this act shall be those now or hereafter authorized and used by the U. S. Bureau of Mines."

*General Laws of Texas, 1919, Chap. 125* (passed by Senate Feb. 28, 1919, House March 17, approved March 24, effective 90 days after adjournment).

It is not necessary to consider whether as a police regulation this statute might validly apply even to interstate commerce, particularly so since during the time the Interstate Commerce Commission rule authorizing the calling of the material "casinghead naphtha" was in effect it was possible to comply with those rules without violating this statute.

The specifications given in this statute of the only material which may lawfully be called "gasoline" are the same as the War Department's standard, the Bureau of Mines' standard and defendant's own standard (*Rec.*, p. 596). The Government does not dispute the fact that the material shipped does not begin to meet these specifications, but, on the contrary, is wholly outside of them. Instead, the Government insists that whether or not a gasoline meets some particular standard does not determine whether or not it is gasoline. We do not dispute this proposition, nor do we for a moment contend that all material which does not meet these particular specifications is not gasoline. We concede that any material which will meet the definition given by defendant's experts, *i. e.*, one suitable for ordinary use under ordinary circumstances in an ordinary motor car, is gasoline. This statute was not offered with any idea of attempting to prove that only such material as meets the specifications therein given is gasoline. It was offered upon the theory of negating the implication sought to be raised by the Government's testimony that the material shipped was customarily called gasoline.

Section 4353 of the Revised Laws of Oklahoma, 1910, is as follows:

"Gasoline, benzine, naphtha or other highly inflammable liquids, the products of petroleum, shall not be tested by the flash test, but the said fluids shall be tested as to their safety by the specific gravity test. Whenever the said liquids shall be

shown to have a specific gravity greater than seventy-four degrees (at a temperature of sixty degrees Fahrenheit) as indicated by the Baume hydrometer for liquids lighter than water, then it shall be deemed unsafe, and its sale or other disposition is hereby prohibited for use in vapor stoves or other domestic uses, and any person selling or otherwise disposing of the same shall be fined in any sum not less than one hundred dollars nor more than five hundred dollars for each barrel, cask or other receptacle or part thereof of such oils so sold as above prohibited."

*Revised Laws of Oklahoma, 1910, Vol. 1, Sec. 4353.*

It will be noted that this section of the Oklahoma laws declares to be unsafe, and prohibits the sale for use in vapor stoves or other domestic uses, any liquid having a specific gravity greater than 74 degrees Baume at 60 degrees Fahrenheit. The evidence in this case shows that the material shipped runs from 74 to 84 degrees Baume. Clearly, therefore, it comes within the class declared by this law to be unsafe and prohibited to be sold for use in vapor stoves or other domestic use.

In addition to the above two statutes, the defendant offered to show that the State of Oklahoma, which has a gasoline inspection and tax law, does not tax or inspect this material as gasoline.

If the proper name of the material in question is to be determined, not as a scientific fact known to the court and shown by the scientific literature on the subject, but is rather to be determined and shown by the custom of the people in the use of names to designate it, it is difficult to conceive of a higher class of evidence of this character than the laws of the people. When custom and usage are in question, there is nothing so persuasive as the laws of the community involved. Suppose there was evidence to the effect that there had been a custom

in the State of Texas of calling this material "gasoline." What stronger evidence could there be that such custom had been stamped out than in showing that the laws of that state had made it criminal to indulge the practice. It should be borne in mind that the proof of custom offered is not direct evidence of what the material is, but simply evidence from which an inference might be drawn. Here, however, we have a statute that prohibits such a custom. It is inconceivable that a state would pass a law making it a criminal offense to describe a commodity by its true name. On the other hand, the inference is irresistible that a statute of this character was passed for the express purpose of preventing the use of an improper name of the commodity. The suggestion of the trial court that the statute may have been passed at the instance of defendant, as a reason for its exclusion, is of course absolutely without merit (*Rec.*, p. 724). Even if such had been the case, the statute would none the less have been admissible, for it cannot be assumed or presumed that the legislature was corrupted or that it acted otherwise than properly. There is little doubt, however, of the effect upon a jury of a remark of this character by the trial court in its presence.

The law of Oklahoma and its practice with respect to taxation and inspection stand upon the same footing as the Texas statute. There could be no higher quality of proof of the custom and usage of a people than its laws and official acts. The Corporation Commission is under a duty of law to inspect and collect taxes on gasoline. If this material were in fact gasoline, it would be violating its duty not to inspect and tax it as such. It is entitled to a presumption of discharge of its legal duty. And consequently, whatever value may attach to its interpretation and conduct towards establishing that the material is not in fact gasoline, certainly its interpretation and conduct must have great weight towards establishing custom and usage to the contrary.

## PART IV (j).

**The rejection of other evidence offered by defendant was erroneous.**

The evidence here considered is covered by Assignments of Error as follows:

LXI (*Rec.*, p. 1616), testimony (*Bill of Exceptions*, *Rec.*, pp. 282, 283) offered on cross examination of Government witness Waddell, the carrier agent at destination, by which defendant sought to show that upon the first attempt of the carriers to assess gasoline rates on its shipments defendant procured a preliminary injunction from the United States District Court for the Southern District of Texas, which was still in force: LXX (*Rec.*, pp. 1627-1629), rejection of defendant's exhibits 143 to 148, inclusive (*B. of E.*, *Rec.*, pp. 1478-1499), being certified copies of the pleadings in said injunction suit (*B. of E.*, *Rec.*, pp. 786, 787): LXVII (*Rec.*, p. 1624), rejection of evidence offered by defendant by its expert witness, Dr. Schock, tending to show how it is possible scientifically to determine by its curve that a mixture of casinghead product and lubricating oil is not gasoline (*B. of E.*, *Rec.*, pp. 733, 734): LXVIII (*Rec.*, p. 1625), rejection of evidence offered by defendant by its expert, Mr. Taber, that the definition of the term "unrefined naphtha" given in the work of Bacon & Hammer (read by him) comprehended casinghead product (*B. of E.*, *Rec.*, pp. 780-784): LXXII (*Rec.*, p. 1630), rejection of the evidence offered by defendant on cross examination of the Government's expert witness Dykema as to the finished commercial products of a petroleum refinery (*B. of E.*, *Rec.*, pp. 864, 865).

Bearing in mind that the court had already admitted evidence offered by the Government, which it was claimed tended to show intent, it was naturally of the utmost

importance that the defendant should be accorded opportunity to negative the existence of any such intent. With this object in view, defendant sought to show that after the material had been transported by the carriers for over two and a half years upon the description "unrefined naphtha," with full knowledge to them through the observance of the safe transportation regulations which required and permitted that certain placards be used only upon casinghead product, upon the first attempt of the carriers to assert that such description and classification was wrong and that the gasoline rates should instead be applied, defendant immediately enjoined said carriers and put up a bond to protect them in the amount of the difference between the charges in the event it should ultimately be found by the court that the gasoline rates should be applied, and attempted to bring this matter to issue on the merits months before any indictment was returned. Surely such a course indicated the best of faith on the part of the defendant.

Even if it be supposed that the defendant was wrong in its belief that the material should be properly classified as unrefined naphtha, that alone would not be sufficient to convict it of a crime of wilfully and knowingly obtaining a concession. Consequently, when the Government had been permitted to produce evidence of intent, the defendant ought certainly to have been permitted to show this circumstance as negating intent.

There is a rule frequently adverted to in this class of cases with which this court is of course familiar, to the effect that it is not incumbent upon the Government to expressly establish intent, that is, that under the familiar doctrine that persons are presumed to intend the natural consequences of their act, that proof of the act is sufficient to imply intent. Since the enactment of the Elkins Act, the Government has persistently taken the position that this rule means that there is an *irrebuttable* presumption

that whatever is in fact unlawful, was in fact so intended to be. In other words, that what is the legal rate is a legal conclusion; that any departure therefrom is therefore unlawful; that, being as the thing which is unlawful had been done, there was an irrebuttable presumption that it was intended to be done. The doctrine was urged upon this Court in the *Armour case* (209 U. S. 56), and left by it as a *quaere* undecided.

In the *Lehigh Coal & Navigation Company case* (250 U. S. 556), the defendant below sought to offer evidence tending to show its good faith in the transaction there involved, upon the theory that such showing tended to negative wilful intent and that the defendant was entitled to have the jury pass on the question of intent as a fact. The trial court, however, struck this evidence out and refused to allow it to go to the jury, upon the contention that the intent was irrebuttably to be presumed from the acts and that if there was any mistake it would not be a mistake of fact but of law. The propriety of this course of the trial court was certified to this Court by the Circuit Court of Appeals, and the Supreme Court, brushing this nonsense aside, reversed the conviction and sent the case back for retrial. The defendant in that case had offered evidence tending to show that an attempt had been made to publish, in what was conceived to be legal tariff form, certain lateral allowances made to it; that it believed, and had reason to believe, that they had been lawfully published; and that the Interstate Commerce Commission's investigators had examined into the matter and raised no objection. The defendant's evidence along this line was received over the objection of the Government, but the court finally struck it out and refused to submit the question of good faith to the jury, and the certificate of the Circuit Court of Appeals to the Supreme Court asked the following questions:

"1. In the criminal prosecution of a shipper for knowingly accepting transportation at less than

the duly established rate by receiving an allowance that was referred to in the tariff but was not specified in figures therein, has the defendant a right to offer evidence that the allowance was received under the honest belief that it was lawfully established by the tariff, and under the honest belief that in receiving it he was not disregarding what he believed to be the provisions of the tariff but was complying therewith?

"2. Upon the foregoing facts, and in view of the kind and amount of evidence offered upon the subject of good faith, did the District Court err in the present case by refusing to submit the question to the jury?" (250 U. S. 562.)

Upon these questions the opinion of the Supreme Court is as follows:

"The questions asked depend upon the construction of the Elkins Act, as enacted in 1903 (32 Stat. 847) the relevant part of which is as follows: '• • • It shall be unlawful for any person, persons, or corporation to offer, grant, or give or to solicit, accept, or receive any rebate, concession, or discrimination in respect of the transportation of any property in interstate or foreign commerce by any common carrier subject to said act to regulate commerce and the acts amendatory thereto whereby any such property shall *by any device whatever be transported at a less rate than that named in the tariffs published and filed by such carrier* • • •.' And under an amendment in 1906 (34 Stat. 584), an offender, 'whether carrier or shipper, who shall, knowingly, offer, grant, or give, or solicit, accept, or receive any such rebate, concession, or discrimination shall be deemed guilty of a misdemeanor.'

"The way to a correct construction of the act was to an extent cleared by the case of *Armour Packing Co. v. United States*, 209 U. S. 56. Its evolution was there detailed. It was said that carrier and shipper are charged with an equal re-

sponsibility and liability and that the act 'proceeded upon broad lines' to accomplish this equality, and 'that the only rate charged to any shipper for the same service under the same conditions should be the one established, published and posted as required by law.' And this was declared in various ways to be the test of obligation and liability and the 'form by which or the motive for which' its evasion or disregard is accomplished is not of modifying or determining consideration. It was in effect decided that the purpose of the statute took emphasis and meaning from the use of the word 'device,' and 'device' was defined to be 'anything which is a plan or contrivance' and is 'disassociated' from qualification and 'need not be necessarily fraudulent,' and by it the act sought 'to reach all means and methods by which the unlawful preference of rebate, concession or discrimination is offered, granted, given or received.'

"It is in effect the contention of the Government that the language of the case exhausts definition and excludes the supposition of the questions of the Circuit Court of Appeals. We are unable to concur. The language of the case is easily explained by the question that was presented for decision. The Armour Packing Company contended that the act was directed only at fraudulent conduct, the obtaining of a rebate by some dishonest or underhand method, concession or discrimination. The language of the court was addressed to this contention and its selection and adequacy are manifest.

"No such contention is made in the case at bar and there are other distinguishing elements. It will be observed that by the statute and the decision the test of quality is the tariff rate. It was said in the opinion that it is 'the purpose of the act to punish those who give or receive transportation, in the sense of actual carriage, at a concession from the published rates' (*New York Central R. R. Co. v. United States*, 212 U. S. 500, 505). And such was the offense of the Armour Packing Company.

There was no evasion of the tariff rate in the case at bar. The filed tariff indicated the existence and obligation of the 10th covenant of the lease from the Company to the Railroad, that is, the fact of the allowance was declared, though it did not have specification in figures. The tariff, of course, would have been more definite and complete with such specification, but its sufficiency was certainly believed in, for between 1906 and the date of the indictment it had 262 repetitions. The Company was given besides the assurance that it had the sanction of the Interstate Commerce Commission.

“There was no attempt at deception. The Commission knew by examination of the Company’s books of the allowance and the amount of the allowance. Such, then, is the situation, and distinguishes the case from the *Armour Packing Company* cases. There there was an omission to comply with the statute and the omission was attempted to be justified by honesty of motive and purpose; here there was compliance or attempted compliance with the statute—a tariff filed—and if a question could be raised upon its legal sufficiency and belief of the Company in its legality was supported by high authority and those circumstances can bring into action and exculpating effect the provision of the statute which requires the acceptance of a rebate to be ‘knowingly’ done to incur the guilt of a misdemeanor. This conclusion gives no detrimental example against the efficacy of the law.

“We think this comment and conclusion enough to dispose of the questions asked and that there is no necessity to review the cases cited by the Company or the Government.

“Some of the contentions of the Government we may notice. It is contended that the ‘lateral allowance’ provided for in the 10th covenant and footnote to the tariff was not for transportation services and besides that there was no testimony whatsoever that the meaning of any provision of the tariff was misunderstood. The mistake, if any, it is hence insisted, was a mistake of law, not of

fact. Two deductions are hence made by the Government: (1) That the allowances were not made for transportation services; (2) mistake of law is irrelevant to the question of the guilt or innocence of the Company.

"To the first we may reply it is not involved as an element in the question asked of this court and if it have any justification, as to which we express no opinion, it no doubt will be considered by the Circuit Court of Appeals upon the return of the case. The other expresses a refinement. Indeed, the contention of the Government is somewhat elusive and we are not sure that we exactly estimate it. It is said, 'The sole misunderstanding which the excluded testimony tended to show would consist in supposing that the 'allowances' could be justified by the footnote in the tariff and that, as we have seen, would be a misunderstanding of the Elkins Act, not of the tariff.' We are unable to concur. There was no misunderstanding of the Elkins Act or what it required. The misunderstanding was induced by practice and the opinion of those in authority that the act was complied with and the word 'knowingly' therefore, as we have already indicated, must be considered and given exculpatory effect if error there was.

"We therefore answer the first question in the affirmative, but as explained by reference to the certificate of facts above. We do not think it is necessary to answer the second question." (250 U. S. 562-566.)

In the present case the situation is even worse than it was in the *Lehigh Coal & Navigation case*. Here the court allowed the Government to produce evidence of supposed intent, *but refused to allow the defendant to introduce evidence to negative such supposed intent*.

The evidence offered by Dr. Schock concerning the character of a curve that would result from the distillation test of material composed of a mixture of casing-head product and lubricating oil was important. It was

shown by an abundance of testimony that the approved method of determining whether or not a material was suitable for use as gasoline was by plotting the curve of its distillation; that such a curve would demonstrate by the relation of the boiling points whether or not the material was suitable. As an illustration, he was demonstrating that the curve of such a mixture as that suggested would indicate why the material would not be gasoline. With such a demonstration it would have been simple for the jury to understand the reasons why, and believe that, the casinghead product, either unblended or blended as shipped to defendant, would not be suitable for use as gasoline.

The rejection of Mr. Taber's testimony, to the effect that the definition of the term "unrefined naphtha" given in the work of Bacon & Hamor (read by him) comprehended casinghead product, was quite unfair to the defendant. The work of Bacon & Hamor had been written in 1914 and published in 1916, long before any of the transactions involved in this trial had occurred, and the fact that their definition of the term would embrace this material was extremely important. This court can see that it is a fact that the definition would comprehend this material, the definition being that it was those naphtha fractions boiling up to a temperature of 150 degrees Centigrade under atmospheric pressure. As the evidence of all the experts and all of the tests showed the material to be such, the witness ought therefore to have been allowed to explain to the jury that such was the case. The bare statement of the definition to the jury was not sufficient to show it that the material was embraced therein.

The rejection of the evidence sought to be adduced from Government witness Dykema upon his cross examination as to the finished commercial products of a petroleum refinery was excluded by the court upon the theory that he had not been qualified as an expert refiner, and that the defendant had objected to his attempting to

give testimony of that character. The fact is, however, that he had testified at considerable length concerning refining (*Rec.*, pp. 833-838), and this was proper cross examination of such testimony. He would have been compelled to name gasoline as one of the finished commercial products of a petroleum refinery and to have excluded casinghead gasoline from his enumeration, and as he was arguing to the jury that casinghead gasoline was not unrefined, because it was pure, he would thus have destroyed his argument by failing to include it as a refined article.

When it is evident that a paid expert of this character seeks to sustain, by argument and equivocation, the contention he is employed to sustain, it is obviously necessary, in order to show the inconsistencies of his testimony, to do so, by indirection, as it is to be expected that he would otherwise attempt to reply argumentatively in a way to sustain the contention desired.

#### **PART IV (k).**

**Inflammatory, prejudicial and unfair comment and improper procedure indulged by Government counsel and the court in the presence of the jury resulted in the denial to defendant of a fair trial.**

The matters herein discussed are the subject of the following Assignments of Error:

LXXV (*Rec.*, p. 1632), statement by Government counsel Payne in the presence of the jury to the effect that defendant and the Gypsy Oil Company were in a conspiracy to misbill the shipments (*Bill of Exceptions, Rec.*, pp. 273, 274): LXXVI (*Rec.*, pp. 1632-1634), statements by Government counsel Payne in the presence of the jury implying that the witness Timmons was not testifying truthfully, and tending to impeach said wit-

ness, who had been called by the Government (*B. of E., Rec., pp. 307, 308*): LXXIX (*Rec., p. 1638*), statement of Government counsel Payne in the presence of the jury, to the effect that defendant had misrepresented to the carriers in a certain letter (*Ex. 97, Rec., p. 1376*) the commodity to be shipped, and when called upon by the court to show where the alleged misrepresentation was contained in said letter said it was not there in black and white, but there just the same (*Rec., p. 570*): XXIX (*Rec., pp. 1590, 1591*), XXX (*Rec., p. 1591*) and XXV (*Rec., p. 1598*), permitting by the court, over objection, of the persistent reading by Government counsel into questions contents of writings not offered in evidence (*B. of E., Rec., pp. 470-472, 500*): LXXVII (*Rec., pp. 1634, 1635*) and LXXVIII (*Rec., pp. 1635-1638*), statements by the court in the presence of the jury implying that defendant was making technical objections or objections not authorized by law, and suggesting that as a consequence he would keep the parties there three months and adjourn the jury over (*B. of E., Rec., pp. 359, 360, 362-364*); CXVIII (17) (*Rec., p. 1663*), improper comment of Government counsel in summing up, by Government counsel Payne to the effect that the defendant had used improper, illegal and fraudulent means to obtain the establishment of rates intending to falsely bill thereunder (*Rec., p. 935*); by Government counsel Gann, that one of the defendant's experts was an employee of the Mellon Institute, that it was founded by the Mellon family, that Mr. W. L. Mellon is president of the Gulf Oil Corporation, there being no evidence in the record to sustain such statement, and it having a tendency to prejudice the jury against said expert's evidence (*Rec., p. 956*); suggestion by Government counsel Gann that by reason of federal control the Government had suffered financially as a result of the transactions in question, and that the jury and all the general public would have to contribute to make up the amount of which it was alleged

the Government had been deprived (*Rec.*, p. 906); comments by Government counsel Chambers upon the wealth of defendant and to the effect that it had deprived the Government of hundreds of thousands of dollars, of which the people would have to bear the burden, and statements to the effect that defendant had violated the safe transportation rules, whereas it was judicially admitted by Government counsel in the course of the trial that defendant had on the contrary complied with such rules (*Rec.*, pp. 906-908); further statements by Government counsel Chambers, after having been cautioned by the court, that the mutilated records had been brought to the grand jury with a knowledge of their mutilation which had been concealed from the grand jury, there having been no evidence whatever offered from which even an inference could be drawn as to what had transpired before the grand jury, and the repetition of the suggestion, after warning by the court, by stating that the force and effect of everything was as he had previously said (*Rec.*, pp. 910, 911).

Error has been assigned to but a few instances of the character of these herein considered, simply for the purpose of demonstrating how unfairly the case was tried.

As pointed out in Part II of this brief, misbilling is itself an offense for which the Gypsy Oil Company could be (and in fact has been) indicted, which is an entirely different offense from that charged in this indictment. As argued in Part III, this defendant was entitled to a trial on the charge of accepting a concession, and a concession is a thing voluntarily given by the carriers; and to create the impression with the jury that the offense charged would be made out if the jury was convinced that the carriers had been defrauded, was entirely unwarranted and unfair.

In the case of the attempt to impeach the witness Timmons, an unbiased reading of his testimony shows that he testified as fairly and truthfully as a man could, and it

is obvious that Government counsel was simply nettled at his own failure properly to comprehend the subject under discussion and took it out on the witness, and, because the evidence proved unfavorable to the Government's contention, created in the presence of the jury an atmosphere of doubt as to the truthfulness of the witness.

The statements by the court, in the presence of the jury, implying that counsel for defendant were making unreasonable and technical objections, the result of which would be to hold the jury for three months, were highly unfair and unjudicial. Counsel for defendant were earnestly striving to compel a trial of the case on legitimate evidence, and the very fact that the court ultimately sustained the objections made conclusively proves that they were not unwarranted. Defendant's counsel were willing to admit, and ultimately did admit, the relevant facts then being sought to be proved by the Government, which was at first unwilling to take the admissions as offered.

The statements by Government counsel Payne, to the effect that defendant, in its letter *Exhibit 97*, had misrepresented to the carriers the commodity which it was intended to ship, which misrepresentation, although not there in black and white, was there nevertheless, and which he reiterated in summing up, were most unfair, particularly in the light of the fact that defendant had attempted to show by the witnesses Reilly and Powers, and upon objection of the Government had by the court been denied an opportunity to show, what the understanding of the carrier agents was as to the representations contained in the letter in question. Defendant offered to show by the witnesses Reilly and Powers that they were not misled by the letter, but understood it to be in line with the negotiations theretofore undertaken by Mr. Ellis with them, and that they acted upon it on such understanding; and this evidence the court excluded upon the objection of the government. Consequently, it

poorly laid in the mouth of the Government to ask the jury to guess that the carrier agents had been deceived when they themselves had been prevented from telling whether they had or not.

The remarks of Government counsel Gann, implying that Dr. Bacon, because of his connection with the Mellon Institute, was under the domination of Mr. Mellon and therefore, by implication, under the domination of defendant, were absolutely unworthy. Yet it is an insinuation which might tend considerably to influence a jury so far removed from Pittsburgh as to be unlikely to be familiar with the Mellon Institute.

The further suggestion by both Government counsel Gann and Chambers in summing up, that the jury would be financially affected in the way of taxation by the transactions involved, was a most outrageous attempt to influence its action by a plea to its pocketbook. In attempting to reply to this suggestion, counsel for defendant suggested to the jury that such would not necessarily be the case, that if defendant was wrong in its description it was still open to civil suit for the recovery of charges, and as it would be able to respond to such a judgment the jury would not be warranted in assuming that they personally would suffer financially. Government counsel Chambers then took advantage of this statement to attempt further to inflame the jury, by commenting on the wealth of the defendant, and again suggested that the jury would be financially affected by the alleged failure of defendant to pay the proper freight rates. He attempted further to inflame the jury by suggesting that defendant's course in violation of safe transportation rules respecting dangerous articles had jeopardized public transportation. This statement was absolutely unwarranted, the Government itself having conceded that defendant complied with the safe transportation regulations (*Rec.*, p. 436).

This character of comments and the refusal of the court to specifically instruct the jury upon the request of defendant that the Government had in fact admitted that the safety regulations had not been violated, instead leaving it to the jury to depend upon its recollection, and the failure of the court to place in the right light before the jury the statements concerning the ability of the defendant to respond in damages, instead of merely leaving the situation that both parties had gone outside the record, was most unfair to the defendant.

As previously stated, only a small portion of the exceptions to comments of the character above noted were assigned as error, and this was done merely for the purpose of showing that defendant did not receive the fair trial to which the Constitution entitled it.

#### **PART IV (I).**

**The court should have directed a verdict of acquittal.**

Assignment of Error LXXXII (*Rec.*, pp. 1646, 1647).

At the conclusion of all the evidence, the defendant moved the court to instruct a verdict for defendant upon the ground that the evidence showed that there was involved a question concerning the construction of tariffs filed with the Interstate Commerce Commission, jurisdiction to construe which is exclusively confided to that body, and the trial court without jurisdiction; and upon the further ground that there was a variance between the proof and indictment, and that the defendant was not guilty (*Rec.*, pp. 899-901).

The two first grounds, i. e., lack of jurisdiction and variance, have been hereinbefore considered under subdivision (a) of this Part. There remains the further ground that upon all the evidence no case was made out.

If the court should be of the opinion urged in subdivision 1 of (a) of this Part, that it is a matter of judicial knowledge that the material involved in the controversy is not gasoline, it was of course the duty of the trial court to have instructed a verdict for defendant. Even if, however, the court does not so find as a matter of judicial knowledge, it is submitted that the proof overwhelmingly established that the material in question was not in fact gasoline. As hereinbefore stated, no direct proof was offered by the Government in its direct case to the effect that the material was in fact gasoline. The only character of proof was that offered on the theory of admissions, to the effect that the material had been called gasoline at other times and under other circumstances. On rebuttal, the Government did call two expert witnesses, who attempted, in substance, to testify that the material was gasoline. It appeared from their evidence, however, that they simply used the name "gasoline" as interchangeable with "naphtha," so that the question resolved itself not into whether "naphtha" or "gasoline" was appropriate—as it was conceded that both were—but rather as to whether the material was unrefined. There was no attempt to dispute the proposition that it never had been refined by any human agency, but a claim that it had been refined by nature underground, which was obviously but a theory at most. And it was further admitted by these witnesses that their claim that the material was not unrefined was based upon the use of the word "refined" as synonymous with "pure." The proof was overwhelming, however, that the word "refining" as applied to the petroleum industry is not synonymous with "purification," but, so far as purification is involved, it is only incidental, and that refining consists in the necessary processes to produce the finished products of petroleum oil. Upon this evidence the case ought not to have been allowed to go to the jury.

Apart from the foregoing, there was a complete failure of proof on the part of the Government of the averments in the indictment to the effect that defendant knew the gasoline rates alleged to have been in force. Without some proof to substantiate this averment, the practical effect would be to read the word "knowingly" out of the statute. Doubtless the Government would say, in response to this, that it is not necessary for it to offer proof of such knowledge, that shippers are presumed to know the rates. Expressions to that effect may be found in civil cases, but they have absolutely no bearing in a criminal case where knowledge is an essential element of the crime. The more correct expression to have used in such civil cases is that it is immaterial whether a shipper knows the rate or not. He is bound of course by the legal rate so far as his liability to pay it is concerned. This is a wholly different proposition from the requirement of knowledge as an incident to a criminal offense.

In the first *Standard Oil* trial (155 Fed. Rep. 305), Judge LANDIS held, in substance, that a shipper was *conclusively* deemed to know the lawful rate, and excluded evidence tending to show that it did not in fact know the lawful rate. This was one of the questions upon which the Circuit Court of Appeals reversed the judgment of conviction.

*Standard Oil Co. of Indiana v. United States,*  
164 Fed. Rep. 376.

The syllabus of the decision of the Circuit Court of Appeals is as follows:

"Under Elkins Act, Feb. 19, 1903, c. 708, 32 Stat. 847, Sec. 1 (U. S. Comp. St. Supp. 1907, p. 880), making it unlawful for any person or corporation to accept or receive any rebate, concession, or discrimination in respect to the transportation

of any property in interstate or foreign commerce, and requiring the filing and publication of interstate rates, a shipper cannot be convicted of accepting a concession from the lawfully published rate without proof of knowledge of what such rate in fact was; and hence evidence that the shipper had no knowledge of the published rate, and could only have ascertained the same by construction of several tariff sheets, the application of which was questionable, was admissible."

When the case went back for retrial, Judge ANDERSON, expressing the view that if a tariff were properly posted it might raise a presumption of knowledge against the shipper, ultimately directed a verdict in favor of the defendant for lack of proper proof of establishment of the rate alleged and knowledge thereof.

Whether the proper posting of a tariff might raise a presumption of knowledge, is not here important, because the indictment does not aver, and no proof whatever was offered, that the tariffs were posted. All the indictment avers is that the defendant had knowledge of these rates, and as to this there was not a scintilla of actual proof.

In *United States v. Miller*, 223 U. S. 599, an indictment under this act had been quashed by the Circuit Court upon the ground that it failed to allege that the tariffs had been posted in accordance with law. The Court held that it was not necessary that a tariff should be posted to constitute the offense, and, obviously, it was therefore not necessary to aver or prove, in an indictment against the shipper, the fact of such posting. But it is significant to note that in that case the Government pointed out to the court that the indictment charged *knowledge* of the rate by the defendant (223 U. S. 600).

Clearly, if the averment of knowledge is necessary in the indictment, it must be proved, and, as before pointed out, an omission of the averment and proof of knowledge would be to read the word "knowingly" out of the statute.

## PART IV (m).

**Refusal of instructions to the jury requested by defendant was error.**

Assignments of Error LXXXIV to CXVI (*Rec.*, pp. 1648-1660) cover the following instructions to the jury asked by the defendant and refused by the court:

The instructions given the jury are shown at *pages 912 to 931* of the Record, and those asked by defendant and refused by the court are shown at *pages 931 to 943*.

It is considered that the court erred in denying the instructions requested numbered 2, 3, 4, 8, 9, 11, 12, 13, 15 and 16, for the following reasons:

While the charge clearly enough instructs the jury that it must be convinced beyond a reasonable doubt that the material shipped was gasoline, it nevertheless falls short of the instructions requested and which it is thought ought to have been given, because the jury, although convinced that the material might properly be called "gasoline," may also have believed that it might properly be called *both* "gasoline" and "unrefined naphtha." In such circumstances, the defendant could of course be guilty of no offense in utilizing the description which would accord it the lower of two possible rates. Quite apart from this, even if the jury were convinced that the material was gasoline, and that it could not properly be called unrefined naphtha, it was still necessary that it be convinced beyond a reasonable doubt that the defendant *knew* that it was gasoline *and* did not honestly believe that it could properly be called unrefined naphtha.

Knowledge is of the very essence of the offense under this act. While, as elsewhere pointed out, the defendant would be liable civilly for the lawful charges in the event they had not been collected, regardless of its knowledge or belief in the matter, to constitute an offense

there must be knowledge, and an honest belief of the defendant that the material could properly be called unrefined naphtha, would absolutely preclude a conviction. This would be so even if the jury believed that the material shipped could not be called unrefined naphtha; that it was gasoline, and that defendant knew it was called gasoline, if defendant also honestly believed that it could properly be called unrefined naphtha. This is not to say that it was incumbent upon the Government to disprove honest belief of defendant. But if the jury believed (as from the evidence it might very reasonably have) that the defendant honestly believed the material could properly be called unrefined naphtha, regardless of whatever else it might have been convinced of, it would have to acquit.

As previously pointed out, the conviction in the *Lehigh Coal & Navigation Co. case* was reversed by the Court expressly because the trial court struck out evidence of honest belief of the defendant. Certainly, if such evidence was admissible, it was for the jury's consideration, for such influence as it might have on its conclusion as to whether the element of the offense *knowingly* existed. Such being the case, the defendant here was entitled to have the jury instructed to acquit, if it was convinced that defendant honestly believed the material could properly be called unrefined naphtha.

The whole course of defendant throughout the period involved, of open conduct in relation to the matter, provided the most persuasive of evidence that it did so honestly believe. Why would defendant have notified the initial carrier of its intention to use the new description upon its becoming effective, why would it have placed on every shipping order the notice required and permitted by the regulations only as to shipments of casinghead product, why would it have given the Interstate Commerce Commission inspectors free and voluntary access

to its records, unless it honestly believed the material might properly be called unrefined naphtha?

As to requested instructions numbered 5, 6, 14 and 18, it is considered the court erred in denying them, for these reasons:

As previously pointed out, the offense with which defendant is charged is the acceptance of concessions—not fraudulent misbilling. A concession, to be such, needs to be consciously conceded. If the defendant fraudulently misbilled shipments, and thus by defrauding the carriers obtained transportation at less than lawful rates, it would not be guilty of the offense of accepting a concession, but instead of an entirely different offense—that of misbilling, for which it would be indictable and punishable. It was therefore entitled to have the jury properly instructed in this regard.

Request No. 7, which the court denied, in substance that the jury should not consider the evidence concerning the practice of the Gypsy Oil Company and others in referring to the material shipped as gasoline, as tending to establish that the material was in fact gasoline, but could consider such evidence only as bearing on the knowledge of defendant *after* the jury may have reached the conclusion independently that the material was in fact gasoline, ought to have been granted as the evidence would be wholly inadmissible as pure hearsay unless it was receivable upon the theory of admissions, as pointed out in Subdivision (b) hereof, and in such case the admissions would be receivable only as proving knowledge in order to find the necessary intent, *provided* the jury were independently convinced that the material was in fact gasoline.

Request No. 17, denied by the court, was, in substance, that the jury should acquit unless it was convinced beyond a reasonable doubt that casinghead gasoline is a product of petroleum oil.

As pointed out under Subdivision (h) hereof, the proof offered by the Government in support of the averment concerning rates on gasoline was on gasoline as a product of petroleum. On the other hand, the evidence of both the Government and the defendant's witnesses showed, without dispute, that science does not claim to say positively whether the casinghead gas is or is not a part of petroleum. While it may be reasonably questioned whether the court should have permitted the case to go to the jury at all, because of the fact that in these circumstances it would be impossible for the jury to reach a conclusion beyond a reasonable doubt in the matter, at least it would seem that there is no question that defendant was entitled to have the jury instructed that it must be convinced on the point, however frail the evidence.

Requested Instruction No. 19 sought to have the jury instructed that it must be convinced beyond a reasonable doubt upon each element of the offense.

While some of this request is covered by the charge, there is not a word in the charge covering Subdivision (c) of the request, that is, that the rates alleged in the indictment were known to the defendant or were posted at the stations over which the shipments were made. The statute requires knowledge; the pleader recognized the necessity of charging knowledge of the rates; yet there was no proof of such knowledge offered, and it would not have been possible for the jury to have found, owing to the lack of evidence, that defendant knew the rates.

It is considered that Requested Instruction No. 20 should have been given so that the jury might have understood that the carriers might with entire propriety and in accordance with custom publish a lower rate on a particular commodity under circumstances like those here involved. The refusal of the request left the jury possibly to infer that the very publication of the lower

rates in the situation constituted in itself a concession.

Requested Instruction No. 22 was that if the jury was in doubt whether casinghead gasoline is gasoline, it must acquit.

The evidence was undisputed that the material shipped is called casinghead gasoline. The very crux of the case, however, is whether casinghead gasoline is gasoline. It is considered that the mere instruction that the jury must be convinced that the material shipped was gasoline, was not sufficient, because the jury may have considered that they were so finding in merely finding that the material is known as casinghead gasoline, which fact was of course undisputed.

Requested Instructions 23, 24, 25, 26 and 31 related to questions of intent.

As previously argued, and as is obvious, any act to constitute evidence of intent must be an act before or at the time of the transaction having a tendency to accomplish the offense; or an act indicating guilty consciousness on the part of some one within the scope of whose employment would be embraced, at least in some degree, a relationship to the subject-matter of the offense. There was not a particle of evidence of either character. Yet the charge (*Rec.*, p. 926) leaves, and indeed invites, the jury to speculate as to whether or not the erasures offered as indicating conscious guilt might or might not have been made by some responsible agent. If the records in question were records having to do with freight rates, or were records of employees whose duty embraced matters of freight rates, it might be reasonable to permit the jury to draw an inference from a failure to explain the erasures. But, on the contrary, the evidence clearly indicates that they were not records of such a character, but were instead records having no relation whatever to the matter of freight rates and were made by persons whose duties were definitely shown not

to embrace matters affecting freight rates; and consequently, in the absence of any further evidence, it would be the purest speculation in the world from which two diametrically opposite inferences might be drawn, without the slightest degree of greater support for one than the other. In such case the matter is clearly not evidence at all, as it cannot tend to establish any issue in the case.

Refused Instructions 27, 28, 32, 34 and 35 were requests that the court instruct the jury concerning the meaning of the words "refined," "distillation" and "blending."

If, as argued in Subdivision (a) hereof, these words were to be considered in their ordinary meaning, it was the duty of the court to instruct the jury as to the meaning of such words.

Denied Instruction No. 30 was that the jury should not consider the evidence relating to the Texas Company paying the gasoline rate at all, unless and until it was convinced beyond a reasonable doubt that the material shipped was actually gasoline.

As pointed out in Subdivision (d) hereof, it may well be that the Texas Company was overcharged, and the very fact that it sought to recover the difference between the unrefined naphtha rate and the gasoline rate, which the defendant sought to be allowed to show, would negative any inference that the material was gasoline to be drawn from the fact that the Texas Company had paid gasoline rates. To allow the jury to reach the conclusion, based on the evidence that the Texas Company had paid gasoline rates, that the material was in fact gasoline, not only begs the whole question, but emphasizes the error in excluding the evidence offered by defendant to show that the Texas Company subsequently attempted to recover same.

That the denial of Requested Instructions 33, 36, and the instruction requested after the jury had retired, in

response to its request for additional instructions, was most seriously prejudicial to defendant, could not be better demonstrated than by the fact that the jury itself requested the additional instructions on the point involved.

It was most unfortunate, after the refusal to give these instructions in the first instance, that action on the jury's request for them was so long delayed that the jury finally found a verdict without them.

There were offered in evidence, and there was much testimony concerning them, the rules prescribed by the Interstate Commerce Commission concerning the safe transportation of explosive and inflammable articles. As previously pointed out, these rules, during the early part of the period involved, read that the material in question "may be" shipped as gasoline, and recited that when it "is shipped as 'gasoline'," etc., the word "gasoline" being in quotation marks; and during the latter part of the period involved provided that it must be shipped as gasoline, casinghead gasoline, or casinghead naphtha. It is beyond dispute that these rules and regulations are in no sense, and do not purport to be, rate regulations or descriptions for rate purposes, but are purely regulations requiring certain descriptions to be used for purpose of safety.

The evidence showed that throughout the period of time involved on all of the shipping orders there appeared the stamp required by these rules showing that the material shipped was casinghead product. It was of the utmost importance that the jury understand that these were not rate regulations, as of course it might otherwise have found conclusively against defendant on such a supposition. It was likewise of the utmost importance on the question of demonstrating defendant's honest belief in the propriety of its course in designating the material "unrefined naphtha," that the jury take into consideration the fact that in complying with

these regulations—as it was admitted by the Government the defendant had—the defendant clearly made no attempt to conceal the nature of the product, but, on the contrary, branded it so that every one handling it could not help but know what it was that was being called unrefined naphtha.

#### PART IV (n).

**The refusal of the court to set aside the verdict and to arrest judgment and the imposition of sentence, was erroneous.**

Assignments of Error CXVII (*Rec.*, pp. 1660-1664), denial of motion to set aside the verdict: CXVIII (*Rec.*, p. 1665), motion in arrest of judgment: CXIX (*Rec.*, p. 1665), sentence.

While it is recognized that a refusal to set aside a verdict and grant a new trial is not generally reviewable, still, where the circumstances show clearly, as it is considered they do here, that defendant was not granted a fair trial, the refusal amounts to an abuse of discretion, which of course is reviewable.

If it be considered that all the evidence ultimately admitted was properly receivable, still it is contended that defendant was so prejudiced by the admission of the evidence concerning the false test by the Government expert Dykema, even though it was later stricken out, and by the failure to furnish the jury instructions expressly requested by them concerning the safe transportation regulations, that the verdict should have been set aside and a new trial ordered. Apart from this, the court expressed its own doubt as to the propriety of letting the case go to the jury in view of the necessity of construing a tariff, and indicated that if it was a personal instead of a corporate defendant he would not do

so. In such case, inasmuch as the Government was persisting in trying the issue in a criminal case in the fashion it did, it would have been reasonable and fair to have permitted the case to go to the jury to afford the defendant an opportunity of acquittal.

On the other hand, on a verdict of conviction in such a situation, it would seem to be the manifest duty of the court to set it aside. Especially so since it was doubtful how much the admission of improper evidence subsequently stricken out may have contributed to the conviction. There is no principle that will justify less fair treatment of a corporation than an individual, and such a theory is absolutely repugnant to the proper administration of justice.

It is considered that judgment should have been arrested, and the indictment dismissed, upon the grounds considered in Part III and in Subdivision (a) of Part IV hereof.

### CONCLUSION.

It would seem apparent from a consideration of the evidence, even including that which it is claimed is not admissible, that the conclusion of the Circuit Court of Appeals is inescapable that the material in question could in no proper sense of the word be called "gasoline"; and the Circuit Court of Appeals might well have been warranted in remanding the case for dismissal of the indictment instead of for a new trial. Its judgment should, therefore, be affirmed.

Respectfully submitted,

H. L. STONE, JR., Pittsburgh, Pa.

R. L. BATTS, Austin, Texas.

JAMES B. DIGGS, Tulsa, Okla.

FRANK M. SWACKER, New York City, N. Y.

*Counsel for Respondent.*

UNITED STATES *v.* GULF REFINING COMPANY.

CERTIORARI TO THE CIRCUIT COURT OF APPEALS FOR THE  
EIGHTH CIRCUIT.

No. 40. Argued April 15, 16, 1925.—Decided June 1, 1925.

1. Under Jud. Code § 240, certiorari may be granted by this Court, at the instance of the United States, to review a judgment of the Circuit Court of Appeals reversing a judgment of conviction in a criminal case and remanding the case to the District Court for a new trial. P. 544.

2. Where a commodity shipped in interstate commerce is included in more than one tariff designation, that which is the more specific will be held applicable; and where two descriptions and tariffs are equally appropriate, the shipper is entitled to the one specifying the lower rate. P. 546.
  3. Evidence reviewed and *held* to establish that the shipments in question were not "gasoline" but "naphtha", and insufficient to prove that they were not "unrefined naphtha", within the meaning of a railroad tariff applicable. P. 546.
  4. A lower rate properly may be applied to a product shipped in an unfinished condition in the course of manufacture than that applicable to it when finished. P. 548.
  5. In a prosecution of a corporation under the Elkins Act on the ground that it received concessions through shipping its petroleum product as "unrefined naphtha" and not as "gasoline", under a tariff allowing a lower rate for the one than for the other, evidence of other and contemporaneous shipments of the same product to other places as "gasoline" under other tariffs offering no rate on "unrefined naphtha" had no tendency to prove that the product was not "unrefined naphtha" within the meaning of the tariff in question. P. 549.
  6. Nor in such case, did description of the shipments as "gasoline", in compliance with regulations made by the Interstate Commerce Commission under the Transportation of Explosives Act requiring such and similar products to be shipped as "gasoline, casinghead gasoline or casinghead naphtha", have a tendency to prove, or amount to an admission by the defendant, that the gasoline rate was applicable or that the shipments were not "unrefined naphtha" within the meaning of the tariff, since the purpose of those regulations was to require a disclosure of the character of the shipments having regard not to rates but to the dangers to be guarded against. P. 550.
- 284 Fed. 90, affirmed.

CERTIORARI to a judgment of the Circuit Court of Appeals reversing a conviction under the Elkins Act and remanding the case with directions to grant a new trial.

*Mr. James A. Fowler*, Special Assistant to the Attorney General, with whom *The Solicitor General* was on the brief, for the United States.

*Messrs. R. L. Batts and F. M. Swacker*, with whom *Messrs. H. L. Stone, Jr., and James B. Diggs* were on the briefs, for respondents.

*Mr. John F. Finerty*, filed a brief as *amicus curiae*, by special leave of Court.

MR. JUSTICE BUTLER delivered the opinion of the Court.

Respondent was convicted in the district court for the eastern district of Oklahoma on 99 counts, charging that it received concessions and discrimination in rates on gasoline shipped by the Gypsy Oil Company between December 2, 1916, and March 12, 1919, from Keifer, Drumright and Jenks, Oklahoma, to defendant's refinery at Port Arthur, Texas, in violation of the Elkins Act of February 19, 1903, c. 708, 32 Stat. 847, as amended by the Act of June 29, 1906, § 2, c. 3591, 34 Stat. 584, 587. The Circuit Court of Appeals reversed the judgment and remanded the case with directions to grant a new trial. 284 Fed. 90. This Court granted a writ of certiorari. § 240, Judicial Code. 262 U. S. 738.

Defendant, insisting that this Court is without jurisdiction, made a motion to dismiss the writ. The determination of the matter was postponed to the hearing on the merits. In *United States v. Dickinson*, (1909) 213 U. S. 92, it was held that certiorari could not be granted in a criminal case at the instance of the United States. Act of March 3, 1891, c. 517, 26 Stat. 826, 828. But that act was modified by the Act of March 3, 1911, c. 231, 36 Stat. 1087, 1157, being § 240, Judicial Code, which is as follows: "In any case, *civil or criminal*, in which the judgment or decree of the circuit court of appeals is made final by the provisions of this Title, it shall be competent for the Supreme Court to require, by certiorari or otherwise, *upon the petition of any party thereto*, any such case to be certified to the Supreme Court for its review and

determination, with the same power and authority in the case as if it had been carried by appeal or writ of error to the Supreme Court." The words italicized above were added to the provisions of the Act of 1891. The phrase "upon the petition of any party thereto" is not limited by the context. The language, circumstances and history of the enactment make clear the intent of Congress to give this Court jurisdiction on the petition of the United States to bring up criminal cases on writ of certiorari. See 46 Congressional Record, pp. 2134, 4001. And the petition may be granted, notwithstanding the Circuit Court of Appeals remanded the case for a new trial and did not render a final judgment therein. *American Construction Co. v. Jacksonville Railway*, 148 U. S. 372, 385; *Forsyth v. Hammond*, 166 U. S. 506, 513. The motion to dismiss the writ is overruled.

The Circuit Court of Appeals said (p. 102): "It is our opinion that when all competent and relevant proof in the case is given a fair and impartial consideration the conclusion that the verdict is without support, is inevitable," and held that the district court erred in denying defendant's motion that a verdict be directed in its favor. The United States asserts that this was error.

The pertinent language of the act, defining the offense charged, is as follows: ". . . It shall be unlawful for any . . . corporation . . . to solicit, accept or receive any rebate, concession, or discrimination in respect to the transportation of any property in interstate or foreign commerce by any common carrier . . . whereby any such property shall by any device whatever be transported at a less rate than that named in the tariffs published and filed by such carrier . . . or whereby any other advantage is given or discrimination is practiced." (34 Stat. 587.) The gist of each count is that the Gypsy Oil Company delivered gasoline to interstate carriers by

railroad at places in Oklahoma,—Keifer, Drumright and Jenks,—for transportation to Port Arthur, Texas, there to be delivered to defendant; and that defendant knowingly did accept and receive from the carriers a concession or discrimination in respect of such transportation, whereby the property was transported at a rate substantially less than the lawful rate for gasoline. It is not alleged what defendant represented the commodity to be or what, if any, tariff was applied. It was shown at the trial that all shipments referred to in the indictment were made as “unrefined naphtha”, under tariffs specifying rates therefor substantially lower than the contemporaneous rates on gasoline between the same points. The rates then in force from Keifer are illustrative. They were “Oils; Petroleum Oil and its Products . . . listed under the head of ‘Petroleum and Petroleum Products’”, 39 cents per 100 pounds; “Gasoline in tank cars,” 33 cents, and “Unrefined Naphtha in tank cars”, 19½ cents.

Where a commodity shipped is included in more than one tariff designation, that which is more specific will be held applicable. *U. S. Industrial Alcohol v. Director General*, 68 I. C. C. 389, 392; *Augusta Veneer Co. v. Southern Ry. Co.*, 41 I. C. C. 414, 416. And where two descriptions and tariffs are equally appropriate, the shipper is entitled to have applied the one specifying the lower rates. *Ohio Foundry Co. v. P., C., & St. L. Ry. Co.*, 19 I. C. C. 65, 67; *United Verde Copper Co. v. Pennsylvania Co.*, 48 I. C. C. 663. It follows that, if the property in question properly might have been described either as gasoline or as unrefined naphtha, the lower rate was lawfully applied, and defendant was not guilty. And the burden was on the United States to prove beyond a reasonable doubt that the property so shipped was gasoline and was not unrefined naphtha.

The substance of the evidence as to whether the shipments complained of were gasoline or unrefined naphtha

is given in the opinion of the Circuit Court of Appeals, and need not be repeated here. The first distillation of crude oil takes off the elements more volatile than kerosene, and these taken together are known as the "naphtha fraction". After treatment with sulphuric acid, this fraction is divided by further distillation into three products,—gasoline, the lightest, benzine, the intermediate, and naphtha, which is called "painter's naphtha", the heaviest. The gravity of such naphtha is around 54 degrees (Baumé). Casinghead gasoline is produced by compression of gases which come from oil wells. Like the lighter ends or elements first coming off in the distillation of crude oil, casinghead gasoline is highly volatile and dangerous to handle. Its gravity is about 88 to 90 degrees and its vapor tension is from 20 to 30 pounds to the square inch. During the period in question some of the painter's naphtha produced at defendant's refinery was shipped from Port Arthur in tank cars to the casinghead gasoline compression plants of the Gypsy Company at Keifer and Drumright, there to be blended,—about one part naphtha to two parts casinghead gasoline. The gravity of the product was about 70 to 75, and its vapor tension less than 10 pounds per square inch. At Jenks, casinghead gasoline was not so blended, but it was subjected to a treatment called "weathering", which lowered specific gravity and reduced vapor tension to substantially the same extent as was effected by the blending with painter's naphtha. The shipment referred to in each count was casinghead gasoline so blended or weathered. Such reduction of specific gravity and vapor tension made permissible its transportation in tank cars, under the regulations of the Interstate Commerce Commission authorized by the Transportation of Explosives Act. Act of March 4, 1909, § 233, 35 Stat. 1088, 1134, amending act of May 30, 1908, § 2, c. 234, 35 Stat. 554. Regulations for the Transportation of Explosives and Other Dangerous Ar-

ticles, effective October 1, 1914, revised July 15, 1918.\* There is involved no claim on the part of the United States that there was any violation of the act or regulations.

The tariff on unrefined naphtha, under which the shipments complained of were made, became effective December 2, 1916. Prior to that, the blended product was shipped from Keifer and Drumright to defendant's refinery at the gasoline rate. The compression plant at Jenks was not put in operation until after that date. None of the products so shipped as unrefined naphtha was sent to the market or sold to be used as gasoline. All was used at defendant's refinery and mixed or blended with other products to make gasoline which defendant sold; it constituted from five to twenty-five per cent. of such gasoline. The casinghead gasoline, before or after such blending or weathering, did not correspond with specifications for any gasoline sold in the market for use as fuel for motor engines and the like. The evidence was not sufficient to sustain a finding that the casinghead gasoline in question was suitable for ordinary or general use as fuel for such engines. And, on a consideration of all the evidence, it must be held to have been established conclusively that such substance was not so used and was not reasonably suitable for such use. It follows, therefore, that, whatever it may be called, the product was not the familiar article of commerce sold as gasoline.

A lower rate properly may be applied to a product when in an unfinished condition than that applicable to it when finished. In *National Refining Company v. M. K. & T. Ry.*, (1912) 23 I. C. C. 527, it was held that rates applicable to refined oil were excessive when applied to carload shipments of the so-called lighter ends of petroleum

---

\* This act has since been further amended (Act of March 4, 1921, c. 172, 41 Stat. 1444); and the Interstate Commerce Commission prescribed regulations, effective January 1, 1923.

which had been separated from crude oil by a skimming process,—that is, by distillation sufficient to take off the more highly volatile elements,—but which was useless for commercial purposes until a further process of refinement had been undergone; and that a reasonable rate on such product was not more than two cents per hundred pounds in excess of the rates contemporaneously applicable to crude oil. Subsequent to this decision, tariffs covering “unrefined naphtha” were put in effect on the lines from Muskogee, Oklahoma, to Coffeyville, Kansas, and from Oklahoma producing points to Baton Rouge, Louisiana. The product in that case was similar to the casinghead gasoline here in question. Both included the lighter ends or more volatile elements of crude oil; they were unfinished products and differed from ordinary gasoline of commerce in like respects. Presumably, this decision and these tariffs were known to and considered by the shipper and carriers when the tariff on unrefined naphtha was published. And before that tariff was put in, defendant’s representative applied by letter to the carriers for a “seventeen cent rate crude unfinished naphtha” from Port Arthur to Keifer and from Keifer to Port Arthur. The carrier’s representative testified that they were requested “to put in a rate on crude naphtha or unrefined naphtha or unfinished naphtha”, and that he did not recall which. The United States suggests that the shipper did not disclose to the carrier that it intended to ship the product here in question under the proposed tariff. But the evidence negatives any purpose to deceive or defraud the carriers and shows that the purpose of the carrier was to put in a tariff covering the unfinished product referred to in the negotiations as crude unfinished naphtha, crude naphtha, unrefined naphtha and unfinished naphtha.

The United States introduced evidence to show contemporaneous shipments by the Gypsy Oil Company of

such casinghead gasoline to Port Arthur billed as unrefined naphtha and to Pittsburg billed as gasoline, and also shipments by that company and others of the same product to other places, billed as gasoline. But it was not shown that the carriers had published any tariff covering unrefined naphtha to Pittsburg or the other points. In the absence of a rate on unrefined naphtha, such shipments are without significance. There was nothing to show, and no reason to presume, that all classifications had been made that could be made in respect of the numerous products of petroleum, and of those referred to in the industry as gasoline of one kind or another. There being no rate on unrefined naphtha or opportunity to choose between the gasoline rate and some other rate, shipments of the product as gasoline had no probative value or tendency to show that the product was not fairly described by and included within the phrase "unrefined naphtha" in the tariff in question.

The regulations of the Interstate Commerce Commission, revised July 15, 1918, required liquid condensates from natural gas or from casinghead gas of oil wells, alone or blended with other petroleum products, having a vapor pressure of not more than ten pounds per square inch, to be shipped as "gasoline, casinghead gasoline, or casinghead naphtha". Unrefined naphtha was not mentioned. The description of the shipments as gasoline under these regulations had no tendency to show that the tariff rate on unrefined naphtha was not applicable. The purpose of the regulations was to require a disclosure of the character of the shipment, having regard not to rates but to the dangers to be guarded against. It was not an admission on the part of the defendant that the gasoline rate was applicable or that the shipments were not unrefined naphtha within the meaning of the tariff. The language of the regulation illustrates the use of the word "naphtha" to include the casinghead product.

"Naphtha" is a generic term and embraces the lighter or more volatile parts of crude oil down to and sometimes including kerosene. This takes in all the elements of finished gasoline. The words "naphtha" and "gasoline" are often used interchangeably to include the unfinished product of which the gasoline of commerce is made. The thing shipped was an unfinished product. It was taken to Port Arthur to be used to make gasoline. The evidence required a finding that it was naphtha. The insistence of the United States is that it was not "unrefined". The processes for refining crude oil in the production of gasoline include the separation and combining of various elements of the crude product, and are not limited to the elimination of impurities. The evidence is not sufficient to sustain a finding that the making of gasoline of commerce by the use of the blended or weathered casinghead gasoline shipped to Port Arthur did not involve refining, properly so-called. But even if the process was, as contended by the United States, a finishing and not a refining process, it is clear that the phrase "unrefined naphtha" in the tariff in question was not misleading and did not contribute to any deception or fraud. The thing shipped was not ordinary gasoline, and it was lawful to distinguish it by tariff designation and to make the specified rate applicable. The words employed describe the product with sufficient accuracy. The evidence was not sufficient to sustain a finding that the shipments in question were not unrefined naphtha.

*Motion to dismiss denied*  
*Judgment affirmed.*
